Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

HIGHEST PRICE PAID FOR SCRAP IRON.

Orders Solicited and Promptly Executed.

Office, No. 202 Market St., UNION BLOCK.

GEO. S. LADD, President.

ANDREW WHITE, Secretary.

## CALIFORNIA ELECTRICAL WORKS.

134 Sutter Street, San Francisco.

Telegraph Supplies, Instruments of all Descriptions.

FIRE ALARM TELEGRAPH BOXES, GONGS and BELL STRIKERS,

Model Machinery, Patent Office Models, Electro-Magnetic Blasting Machines and Supplies.

### AMALGAMATING PLATES.

1 oz. of Silver Deposit to 1 square foot for \$3.

All orders promptly attended to.

PAUL SEHLER, Superintendent.

Corner Beale and Howard Sts.,

SAN FRANCISCO, CAL.

W. H. TAYLOR, Pres't.

JOSEPH MOORE, Sup't

### Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

### Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barge and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstaine, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

### San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER.

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens exten sively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

33 Fremont Street, San Francisco.

## E. P. WHITE,

SUCCESSOR TO

## La Grande Laundry,

PRINCIPAL OFFICE:

648 Market Street.

LAUNDRY:

Thirteenth street, bet. Howard and Folsom  
SAN FRANCISCO.

All ordinary mending, sewing on buttons, etc., free of charge. Orders left at the office will receive prompt attention. Work called for and delivered to any part of the city free of charge.

### REMOVAL.

## JUSTINIAN CAIRE,

IMPORTER AND DEALER IN

### Assayers Materials, Chemicals

### AND MILL SUPPLIES.

Brass and Steel Wire Screens, Hardware and Fancy Goods, Opera, Field and Marine Glasses, Optical Instruments, Etc.

Nos. 521 and 523 MARKET STREET, S. F.

The attention of Assayers, Chemists, Mining and Milling Companies is particularly called to the complete stock of Balance, Furnaces, Crucibles, Brass and Steel Wire Screens, etc., including all the necessities for Assayers and Miners, as also for Milling men. An experience of 30 years in this line of business enables me to guarantee a strict attendance to the orders which my friends may entrust to me. Gold and Silver Tables and a full list of articles to be found in my store, to be had on application.

FRASER'S ORE CONCENTRATOR OR VANNER.  
Plunger Jigs. Revolving Screens.  
CRUSHING ROLLERS. SAMPLE GRINDERS.

# FRASER & CHALMERS

STEAM ENGINES, BOILERS, STAMP MILLS, FRUE VANNERS  
(and Machinery) for Systematic Mining, Milling, Smelting and Concentration of Ores.  
No. 145 Fulton St. CHICAGO, ILL.

Howell's Improved White Roasting Cylinders.  
REVOLVING CYLINDERS AND ORE DRYERS.  
Hoisting and Pumping Machinery.

HERCULES SLAYING THE GIANTS.

# HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

- No. 1 (XX) is the Strongest Explosive Known.
- No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

## THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.  
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

# GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

## Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. 2 1/2 Triple Force Caps and all Grades of Fuse.

**BANDMANN, NIELSEN & CO.,**  
SAN FRANCISCO, CAL.

## No Drouths! Sure Crops!

### READING RANCH, Shasta Co., Cal.

Good Land!  
Sure Crops!  
HEALTHY CLIMATE!  
Prices Low. Terms Easy.  
TITLE PERFECT.

The Reading Ranch, in the Upper Sacramento valley, originally embracing over 25,000 acres of choice grain, orchard and pasture land, is now offered for sale at low prices and on favorable terms of payment, in subdivisions to suit purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends over 20 miles along its bank.

The average rainfall is about 80 inches per annum, and crops have never been known to fail from drouth.

The climate is healthy and desirable. The near proximity of high mountain peaks give cool nights during the "heated term" which occurs in our California summers.

Pasturage, wood and good water are abundant. The tillage land is mostly level, with complete drainage.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract without irrigation. Also, Alfalfa, Vegetables, Corn and all other cereals ordinarily grown in the state.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The title is U. S. patent. Prices range principally from \$5 to \$30 per acre.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading, all of which are located within the limits of the ranch.

The Sacramento River borders the whole tract on the southeast. Its clear waters are well stocked with fish. Good hunting abounds in the surrounding country.

Producers have a local market, which enhances the value of their produce. The railroad transportation route is level throughout to San Francisco. A portion of the land is auriferous and located near rich mines now being worked. Land suitable for settlers in colonies can be obtained on good terms.

Town lots are offered for sale in Reading, situated on the Sacramento river, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before having here or elsewhere. Apply on the ranch, to the proprietor,

EDWARD FRISBIE,  
Anderson, Shasta Co. Cal.

Location of Shasta County.

Shasta County lies not far from midway between the two most important ports on the Pacific shore, i. e., San Francisco and Portland Oregon, and directly on the overland route, which in the future will become the grand thoroughfare from Mexico to British Columbia. The town of Redding, at present, and probably for years to come, the head of railroad transportation on the California side of the mountains intervening below Oregon, is distant from San Francisco by railroad (via Valjejo) 255 miles; from Sacramento City, 160 miles; from Marysville 117 miles.

LAND FOR SALE OR RENT IN SUB-DIVISIONS.

### GRANDALL SPRING SKELETON BUGGY.

LIGHTEST AND EASIEST RUNNING.

Cannot be upset by cramping or sudden turning. Will pass over the roughest roads or car tracks without jolting. Especially adapted for mountain roads. Warranted for two years.

A. MERSEREAU,  
No. 1927 Mission St., Manufacturer

### SAVE YOUR HORSES! Safety, Security and Economy.

## Roasting Ores for Leaching Process.

Mr. Ottokar Hoffman, a gentleman who has had a great deal of experience and success in leaching operations, and who was engaged by the Silver King mining company of Arizona to put up their leaching works, has planned and carried out at that mine an important improvement in the details of a revolving cylinder furnace, which we show in the drawing given herewith. Mr. Guido Kustel has kindly furnished us with the following description of it:

The usual cylinder furnaces, roasting by charge, are from 15 to 16 ft. long. The flame enters the furnace on one side and escapes through the flue on the other. The ore near the fire side is much more exposed to the heat than at the other end, and the chlorination here is always further advanced than it is in the ore on the flue side. At the Gunnison mill, Nev., I had two cylinder furnaces for roasting a very delicate ore. When it was well chloridized on one side, it was not done on the other, and if the roasting continued so much longer as to effect a uniform chlorination, the ore near the fire side commenced to form small balls, which, increasing by constant rolling, assumed the size of five to eight inches in diameter. Mr. Hoffman found in ordinary cylinders the ore from the fire side from six to ten per cent. less chloridized than the ore from the fire side. For this reason he ordered a cylinder provided with fire-places on both sides of it.

The furnace is 16 ft. long by 6½ ft. in diameter; inside lined with common brick, except the fire-places for which fire-bricks were used. As seen in the drawing there is on each side of furnace a fire-place, B and C, each having an iron flue provided with dampers, A and D. Both flues are connected with the main flue. At the time of charging both dampers are open. Three tons are charged at a time; the furnace has a larger capacity, but, owing to the considerable increase of the ore in volume during the roasting, only a little over three tons are introduced.

When all the ore is in, one of the flues is shut by the damper A, and on the same side the fire started. The flame passes now through the furnace, which revolves once in four minutes, through the opposite fire-place into the flue. After one hour fire is made on the other side, the damper D is closed and A opened, and the flame takes the reverse course. The change of fire from one side to the other takes place every hour. It requires three hours before the roasting of the whole mass is in operation. After 11½ hours the chlorination is completed and ore discharged. It takes half an hour to charge and discharge, so that two charges are discharged in 24 hours.

In starting the furnace, Mr. Hoffman found a considerable loss of silver. He immediately arranged the admission of steam from both sides of the furnace. The steam is let in as soon as the sulphur commences to burn, and the effect was most gratifying, reducing the loss to the minimum, which did not exceed from two to three per cent.

There is a great advantage achieved with the adoption of two fire-places. The roasting is now under perfect control. The chlorination is quite uniform, because of the uniform heat that can be maintained through the whole length of the furnace; at the same time, if necessary, the ore can be roasted at a lower heat than it was possible to do if only one fire were in use, which is of great consequence, as with many kinds of ores a low heat gives a larger percentage of chlorination. Having both flues open, very little dust can escape during the charging, there being no draught through the

furnace, then, being able to keep a lower heat, less ore (or none at all) will stick to the brick lining.

The Silver King ore, from October to the end of December, 1880, as an average of regular daily samples, assayed \$208.26 per ton, and from the 1st of January 1881, \$220.60 (not concentrated). The average value of the tailings, beginning with January, is \$9.94. This shows an extraction of 95.5%, a result of which Mr. Hoffman has all reason to be proud, considering the composition of the ore, which contains native silver, copper-glance, zinc blend in abundance, galena, copper pyrites, peacock ore and fahlore, the latter and galena carrying a great deal of antimony. Mr. Hoffman says that the fahlore (argentiferous gray copper ore) is the most important part of the Silver King ore, it being always present and always rich, even up to \$3,000 per ton; the gangue is quartz and heavy spar.

Zinc blend and antimony are always very troublesome and a great obstacle in roasting silver ore, and the favorable result obtained is due principally to Hoffman's double fire-places and application of steam. After a permanent run of three months and a half, not the slightest

## Lead.

California for several years had a very large export trade in lead, to China but this trade has fallen off very greatly. One year we exported some 5,000 tons. Last year the exports were very small, the Chinese having gone elsewhere for their supplies of this metal. The reasons for this may possibly be found to be those stated by Mr. G. Ross, chairman of the Frongoch (English) Lead Mining Company, at the annual meeting of that company in London a week or two since. He said: "When I was in the chair last year I ventured upon one or two predictions, and, although I am not a prophet, they came pretty right. The statistics of the lead trade for the year 1880 compare very favorably with the statistics for the previous year. The imports of lead for the year were something like 6,980 tons less than in 1879. That is a good feature. The exports have also assumed a more favorable character. Some time back I ventured to say that the Chinese, who were buying their lead largely in California, would, sooner or later come here, and that little forecast is

## A Metallurgical Center.

We have hitherto advocated the establishment of metallurgical centers on this coast, where ore of all classes would be worked, but it seems hopeless to advocate such things when a city with the natural advantages of San Francisco, with relation to the mining regions of the coast, takes no interest in it. During the many years when San Francisco was the ruler of the mining regions of the coast, she could have built up for herself a system of reduction works, which would bring now to her door the trade of the Western mining regions which she sees scattered in other cities. The capitalists of San Francisco, however, have seen more profit in lending money than in building up home industries of this kind.

We can get ores of every sort on this coast, and by combining them judiciously, the poor ore could be made to pay. It takes capital, however, to establish and maintain such works, but they are profitable in the end. All those cities which have gone into this sort of business have made money out of it. The great metallurgical center of the world is Swansea; and notwithstanding its immense business of the past few years, its trade shows a rapid and steady increase. San Francisco, on a smaller scale, could have had a position of the same sort of business, had it taken the opportunity, and it is not too late to begin now even.

The official statistical returns of the trade connected with the port of Swansea for the year 1880, just published by the Harbor Trustees, prove that trade has been good, there being substantial increases in every department. The exports of coal have been larger than ever before known—patent fuel also shows a very large increase—the trade being nearly double what it was two years ago. The exports of iron and steel also show substantial increases. The increase in the imports has been principally in iron ore, pig iron and copper ore. The total imports and exports show an increase of on

IMPROVED ROASTING FURNACE WITH DOUBLE FIRE PLACES.

est repairs were required for the furnace. Two more of similar style have been built by the Pacific Iron Works, and will be in working order in 10 or 15 days.

**COPPER.**—Quotations for copper in Liverpool on the 1st inst., for good ordinary brands, were: £62 to £62 5s. on the spot, and for forward delivery £63 to £63 5s. per ton. Ore, 12s. 6d. to 12s. 7d.; and regulus 12s. 9d. per unit. Chile has varied very slightly in value during the month. Furnace material was in considerable request, notwithstanding the strike of the colliers. Stocks show a reduction of 2,455 tons for the month. The Chile figures show a falling off of 10,000 tons compared with last year, and of 5,000 tons compared with the year before. James Lewis & Sons' Ore and Metal report circular gives these figures in detail.

**MAITLAND DISTRICT.**—The new district of Maitland, Nevada, comprises the greater part of the old Walker Lake district, and is bounded as follows: On the north by the old camel trail, beginning at Silver Star district, and running to the southeast end of Walker Lake; on the west by the line of the Carson and Colorado railroad and the Alum Creek wagon road; on the south by the Carson and Columbine toll road, and on the east by the Black Diamond district. The district lies principally on the north side of the range of mountains north and west of what is known as the Marietta range. The minerals of the district are copper, silver and gold, with the former in preponderance.

gradually becoming true, for the exports to China last year were 4,000 more tons than in the previous year, and of this amount something like 1,650 tons were experienced in the latter part of the year, which shows that the trade with China is growing and returning to its old channel. This is a very important point, because the Chinese were eight years ago our largest and best customers, but the Americans undersold us. The Chinese took the lead without much regard to the quality, and found it would not roll. Then, the exports from Greece have fallen off to almost nothing. It looks as if the population took to lead producing very much as some of our people take to stone breaking—only when they are compelled. All these little facts lead us to conclude, and hope, that the coming year will bring us a better price for lead. Within the last two or three days there has been a decided improvement in the zinc trade. The Germans are giving from 25s. to £2. a ton more for zinc, and it is upon the possibility of an improvement in this direction that we depend for a good price for lead. Therefore, without leading you to expect any very brilliant or gorgeous things, I think there are sufficient facts to lead us to infer that our prosperity will be no less than it has been in the past."

**SALT.**—The Sand Springs salt marsh, in Churchill county, Nevada, has been having a lively run the past few months, furnishing salt for the Grantsville mines to the amount of 200 tons per month. The property was for a long time considered valueless, and some years ago was sold for taxes to the present owner, who is now reaping a rich bonanza.

less than 352,404 tons over the trade of 1879; entering a little more into detail, the total quantity of coal and coke exported last year was 999,283 tons, as against 880,214 tons in 1879; patent fuel, 209,771 tons, as against 162,167 tons in 1879; copper, silver, zinc and other ores, 25,120 tons, as against 27,681 tons in 1879; iron, steel, rails, castings, etc., 14,542 tons, as against 8,691 tons in 1879; tinplates, 25,343 tons, as against 26,438 tons in 1879. Other miscellaneous articles were exported, the total exports for the year being 1,333,093 tons, as against 1,158,711 for the year 1879. The imports were, copper, silver, lead, tin and nickel, with their ores and alloys, 140,576 tons in 1880, as compared with 125,591 tons in 1879; iron ore, 122,284 tons, as against only 19,603 tons in 1879; iron, steel, castings, machinery, 94,234 tons, as against 87,437 tons in 1879; which, with the sundries, brought up the total imports for the past year to 648,799 tons, as against 470,777 tons in the year 1879. The total trade of the port (import and export) for the past year was 1,981,892 tons, as against 1,629,488 tons in 1879. The total income of the harbor for the past year was £68,860 16s. 7d., and the total expenditure £58,208 12s. 9d. (which included no less than £28,966 3s. 9d. interest on the bonded debt), leaving a surplus balance of £10,651 3s. 10d. in favor of the trust on the year's working. There is now an accumulated surplus in the hands of the trust of no less than £20,486 7s. 6d., after payment of interests and all expenditure.

The high water washed upon to Jack Power's mining claim, Butte Co., over \$2,000 worth of wood.

Montana Mines.

The hullion shipments from Butte for the week ending yesterday, aggregate \$74,256.20, the largest yet reported in that length of time. This fact is a flattering commentary upon the increasing productiveness of the Butte mines, and is an eloquent appeal for the general recognition of the resources of the district. For a camp which has all the advantages of capital, machinery and railroad communication, the production in one week of \$74,000 is not extraordinary; but when that amount is produced in a district isolated from the continental thoroughfares, remote from the Eastern and Western centers of business, and possessing none of the advantages afforded by the introduction of outside capital, the event becomes of sufficient importance to challenge the attention of intending investors. The regularity and amount of the hullion shipments from the camp are forcing themselves upon the notice of moneyed men, both East and West. A few of the many prominent mines which may be safely depended upon to add to the wealth and fame of the district for years to come, may be enumerated as follows:

Alice, producing daily 60 tons of ore assaying from \$40 to \$80.

Lexington, producing 15 tons per day, assaying from \$60 to \$150 from one level 80 ft. deep, showing a pay ore body 950 ft. long.

Bell, producing 10 tons of silver-copper ore assaying from \$250 to \$500, together with a high percentage of copper, and having reserves of first and second-class ore sufficient to keep a 30-ton smelter in successful operation for upwards of two years. The Bell is constantly improving with depth, and surprises even its owners by its width, richness, regularity and indications of permanence.

Auselmo, with \$50,000 worth of ore on the dump, to which additions are being made at the rate of 10 tons per diem. The most sanguine expectations of the owners of this property are being realized, and it could not be bought today for \$250,000.

The Colusa, a copper mine, producing 40 tons of ore daily, with immense reserves in sight.

The Gagnon, one of the steadiest producers of good ore in the Territory.

The Acquisition, showing in the present working six ft. of \$150-ore.

To this list may be added the Grey Rock, Stevens, Hope, Salishury, Star West, Original, Burnett, Belle of Butte, Pacific, Ophir, Anacanda and Sunnyside, which are all exceptionally fine properties, on a good paying basis, and showing an abundance of workable ore.—Butte Miner, Feb. 10th.

Silver Hill District, Arizona.

From Mr. William Gale the Journal has obtained some very interesting notes of the progress of work in the Silver Hill district, about 40 miles west of Tucson. The mine of John William Murphy, F. B. Knox, of Globe, Tommy Gates and Dave Gibson is showing up splendidly. Some of the capping was broken off, and they got right into a cave of metal almost indefinite in dimensions. The formation is a black limestone, very similar to that in Tombstone, and assaye of carbonate ore average \$169 to the ton.

About seven miles from this camp is the town of Peltonville, where the great copper deposits have been found. Mr. Scott, from Charleston, has recently purchased the old Boot mine from Fish and Shaw. He went over to Tombstone the other day, and brought to the town 20 miners, who are now working steadily to develop the property. The ore is oxide of copper and carbonates, which runs like water.

Mr. Ray, one of the owners of the copper mines in Bisbee, has some fine property near Peltonville, and has struck it rich in one of his claims. He took a number of gentlemen out yesterday to inspect his property.

William Zeckendorf has opened a store at Peltonville. There is every reason to believe the camp will shortly rival our best mining centers.

The Monarch mine and extensions of the Abbie Waterman, owned by Patty Woods, Dr. W. Wheatley, P. O. Shaw and others, in close proximity to the mine of John Wm. Murphy mentioned above, is attracting much attention and showing up finely.—Arizona Mining Journal.

COPPER MINING IN NEVADA COUNTY.—The receipts of the San Francisco copper mining company, whose claim is located at Spenceville, for the eight months ending Dec. 31, 1880, were \$71,993, including \$25,000 from assessment No. 6, levied Sept. 15, 1880. The expenditures were \$76,617. On the 1st of January, 1881, the liabilities of the company amounted to \$5,076, against which there were assets valued at \$68,792, consisting of ore, copper, and supplies. There was 6,980 tons of ore manipulated in the last eight months of 1880, and 334,000 lbs. of copper cement produced. The cave has been opened sufficiently to get out 100 tons of ore daily, at a cost of 50 cents per ton.

THE Committee on Mines in the Arizona Legislature have reported in favor of the repeal of the bullion tax, and the report will probably be adopted.

LARGE quantities of water-pipe are being shipped to the State Line mine, Gold Mountain.

Railroad Fares in California.

Action of the Railroad Commissioners. The Board of Railroad Commissioners held a meeting in this city on Friday, Feb. 18th, Commissioners Cone, Beerstecher and Stoneman being present. The pending resolution to establish a schedule of tariff rates for transportation of passengers on railroads in this State was taken up for consideration, and, after being

amended, was adopted by the Board in form as follows, all the Commissioners voting aye:

Preamble and Order.

WHEREAS, The Constitution of the State of California makes it obligatory on the Board of Railroad Commissioners to establish rates of charges for the transportation of freights and passengers by all railroads and other transportation companies in the State, and publish the same from time to time with such changes as they may make; therefore, ordered

First—That the rates for the transportation of first-class passengers between the following named points shall be as follows:

COMPANY.	FROM.	TO.	Length of Section.	Rate per mile.	Tariff over each section established by the Board.
S. P. R. R.	Yuma.	Los Angeles	249 1/2	\$12.25

Ferry Rates.

The rates now in force on the several railroads for transportation of passengers between San Francisco and the various stations in Oakland, Alameda, Brooklyn and Berkeley are adopted by the Board as its rates.

Uniformity of Rates.

Second—That the rates per mile for first-class passengers over each of the above designated distances or sections, shall be uniform for all

passed at the 23d session of the Legislature of the State of California, styled "An Act to organize and define the powers of the Board of Railroad Commissioners," approved April 15, 1880, and why such resolutions and tariff rates should not go into force and effect on the 20th day after service, pursuant to the provisions of chapter LIX aforesaid, which resolution was adopted by all the Commissioners voting aye.

Rates of Freight.

Commissioner Cone offered the following resolution:

WHEREAS, The Board of Railroad Commissioners have this day, by an unanimous vote, fixed upon rates for the transportation of passengers over the railroads of this State, and have ordered notices to be served upon the several railroads affected, notifying such companies to appear before the Board within 15 days after service of such notices, and show cause, if any there be, why such rates should not go into effect according to law, therefore

Resolved, That the Board now take up the subject of freight rates, and fix and establish the same upon all railroads in this State.

The resolution was passed by an unanimous vote.

Pacific Coast Steamship Company's Case.

The minutes of the previous meeting were then read and approved.

The Secretary then read the following report:

"On Feb. 15, 1881, I was instructed by the Board to communicate with Messrs. D. L. Smoot, Clitus Barboar, Belcher & Belcher, Chipman & Garter, respectively, solicitors and counsellors at law for the Board in the suit of the Pacific Coast Steamship Company vs. the Board of Railroad Commissioners, which I did, on the same day, sending a letter, in form, as follows, to each of the gentlemen mentioned; viz., 'I am instructed by the Board of Railroad Commissioners to request your answers to the following questions, viz.:

'First—What is the status of the suit of the Pacific Coast Steamship Company vs. the Board of Railroad Commissioners?

'Second—How soon will there be a hearing in the matter?

'I am requested farther to state that the Board is very desirous to have the matter brought to judgment as soon as possible.

'Your reply by return mail is requested. Very respectfully, W. R. ANDRUS, Secretary.'

I have to date but one reply in answer from D. L. Smoot, Esq., as follows:

February 16th, 1881.

W. R. Andrus, Esq., Secretary Railroad Commissioners.—DEAR SIR: In reply to yours of the 15th inst., just received, I have the honor to state that the status of the suit, the Pacific Coast Steamship Company vs. the Board of Railroad Commissioners, is as follows:

Complaint, answer and reapplication filed on Dec. 30, 1880, and cause set for hearing on April 6, 1881. I exceedingly regret that it will not come up earlier. If there be any very cogent reasons for earlier hearing, and you will advise me of it, I will see what can be done in that behalf. Very respectfully, D. L. SMOOT.

Dist. attorney city and county of San Francisco.

Respectfully submitted, W. R. ANDRUS, Secretary.

The Board then adjourned to meet at the same place on Saturday, at 10 o'clock A. M.

The accompanying table prepared by the Secretary of the Commission, exhibits actual changes in rates and amounts by a comparison of present and proposed rates.

Silver Reef Items.

A correspondent of the Pioche Record says: It is impossible at this writing to give any definite idea as to the course which in future will be pursued by members of the Stormont Co. towards the miners. One thing in this struggle can be relied upon—that is, the miners will not submit to a reduction of wages. The Stormont's property consists of the Buckeye, Last Chance, Thompson and McNally mining claims, the two latter being situated on the White Reef. There has been thousands of tons of ore extracted from the last named claims, and they show no weakening. About 2,000 ft. to the south of the Thompson and McNally is the McMullen, which is owned by John H. Rice. This is a valuable property, but is not being worked.

The Leeds, if managed properly, would be a paying institution, but a practical superintendent has never had charge. The present superintendent is now in a position where he hardly knows what to do, because his company will neither lead nor drive; consequently the mine—a good one—is of no account to shareholders thereof.

The Christy Co. looks fine, and judging from the amount of hullion which that company shipped last year through Wells, Fargo & Co.'s express, the present year's yield will be far in advance; because the milling facilities of the company have been increased, and are still being enlarged.

The Barbee & Walker Co.'s property is in a flourishing condition. The third level is looking well; the ore vein will average 14 ft. in width, and extends to the north a distance of 300 ft. So that the mine here, as far as I can see, go to the deep.

DULL times in Mammoth district. Mammoth mill is idle. Only few men at work in Monte Cristo tunnel and few more in the Mammoth. Lots of snow and no communication.

## MECHANICAL PROGRESS.

## Malleable Cast Iron.

M. Faarqneque recently read a paper before the French Academy of Sciences on malleable cast iron, in which, as condensed by the *Iron Age*, he states that, as a hard softener, one observes throughout the mass an abundant deposit of amorphous graphite. Matters stand thus when the bar lies in an inert mass, as in anthracite coal; but when the pig iron comes in contact with an substance capable of burning or absorbing the carbon, a secondary reaction sets in. The liberated carbon having disappeared from the superficial zone, the equilibrium determined by the heat undergoes a slight change. A portion of the graphite from the lower strata returns to its combination, and ascending to the surface disappears, and is replaced in its turn by another. The phenomenon continues until the average composition of the bar corresponds to a certain minimum of carburization of the iron, varied according to the circumstances of the annealing process. In inert surroundings the proportion of carbon which remains combined, has evidently the maximum of carburization for its limit, or, in other words, the maximum of the solubility of the carbon at the temperature at which the operation takes place.

The working out of these results recalls in a general sense the principle which underlies cementation, but in reality it is more complicated, inasmuch as it results from the superposition of two distinct chemical actions. A proportion of manganese, even below 5-1000's, gradually arrests the softening process until it ceases altogether. The pig, of course, continues to lose carbon by oxidation, almost as much, in fact, as when it is pure, but the manganese resists the production of graphite and retains it in combination in the metallic mass. The silicon may, to a certain extent, saturate the manganese and drive out the graphite. He finds these explanations based on the following facts, as elicited in the course of his experiments: 1. Pig iron, which is truly malleable, always contains graphite; 2. Pig may lose carbon, and yet remain brittle if graphite be not formed, or if the quantity existing before the annealing process be not augmented; 3. Pig may become malleable without losing a sensible portion of its total carbon, the annealing being effected by the medium of coal, the co-operation of an oxidizing agent not being indispensable to the softening process; 4. If silicon be added to a manganese pig the metal is improved by annealing. His tests on steel have confirmed these conclusions. He was surprised to find that hydrogen toward 900° rapidly decarbonized forge pig. Malleable pig stands midway between steel and gray pig, being distinguished from the latter by special nature of its amorphous graphite and its greater tenacity, and from the former by its feeble extensions and its large proportion of graphite.

**CHANGES IN THE EARTH'S ORBIT.**—Sir Chas. Lyell gives the results of Mr. Stone's calculation of the variations which have taken place in the figure and position of the earth's orbit during 1,000,000 years. These results show the inaccuracy of the statement often made in popular works on astronomy, that the eccentricity of the orbit varies between definite limits, with a definite period of oscillation, the position of the perihelion traveling, meanwhile, continually in one direction. On the contrary, the successive maxima of eccentricity differ considerably, and so of the successive minima. The period of oscillation is variable; and the perihelion not only travels with variable velocity, but sometimes retrogrades for 20 or 30 years together. In the whole range of years tabulated by Mr. Stone, the greatest eccentricity is .0747. This was the case 850,000 years ago, and the earth's orbit was then nearly as eccentric as Mars' present orbit. The least eccentricity within the period tabulated, occurred 900,000 years ago; at this time the eccentricity was .0102. The present eccentricity is .0168.

**RADIANT MATTER.**—Hittorf considers that the results of Crooke's researches upon radiant matter are not essentially different from those which he himself published in 1869. The only novelty which he recognizes consists in Crooke's admission of a fourth state of aggregation. He does not regard this admission as necessary, and he is unwilling to admit that the dark space near the negative electrode represents the mean length of molecular path. He attributes the radiant matter to particles mechanically torn from the electrodes, which are charged with static negative electricity. These particles move in a straight line, with enormous velocity and affect, by a molecular electric convection, the whole track of the current between the two poles.—*Les Mondes*.

**IMPROVED CONSTRUCTION OF BUILDINGS.**—Mr. William H. Older, of Packwaukee, Wis., has patented an improved construction of building designed especially for use upon prairie and other parts of the country where timber is scarce. A peculiarly constructed frame of timber and wire, the timbers being secured by bolts, is the principal feature of the invention. The outside may be covered with straw thatch, tarred paper, etc. A serviceable building can thus be constructed with little timber and at a small cost.

## Steel.

From an article read before the Engineers' Society of Western Pennsylvania, we extract the following points about the use of steel:

1. That a good soft heat is safe to use if steel be immediately and thoroughly worked, for it is a fact that good steel will endure more pounding than any iron.

2. If steel be left long in the fire it will lose its steely nature and grain, and partake of the nature of cast iron. Steel should never be kept hot any longer than is necessary to the work to be done.

3. Steel is entirely mercurial under the action of heat, and there must, of necessity, be an injurious internal strain created whenever two or more parts of the same piece are subjected to different temperatures.

4. It follows that when steel has been subjected to heat not absolutely uniform over the whole mass careful annealing should be resorted to.

5. As the change of volume due to a degree of heat increases directly and rapidly with the quantity of carbon present, therefore, high steel is more liable to dangerous internal strains than low steel, and great care should be exercised in the use of high steel.

6. Hot steel should always be put in a perfectly dry place of even temperature while cooling. A wet place in the floor might be sufficient to cause a serious injury.

7. Never let any one fool you with the statement that his steel possesses peculiar property, which enables it to be "restored" after being "burned;" no more should you waste any money on nostrums for restoring burned steel. For "overheated" steel can be restored by first bringing it to a red heat and allowing it to cool slowly. For "burned" steel, which is oxidized steel, there is only one way of restoration, and that is through the knobbing fire or the blast furnace.

8. Be careful not to overdo the annealing process; if carried too far it does great harm, and is one of the commonest modes of destruction which the steel-maker meets in his daily troubles. It is hard to induce the average worker in steel to believe that very little annealing is necessary, and that very little is really more efficacious than a great deal.

Finally, it is obvious that as steel is governed by certain and invariable laws in all of the changes mentioned, which laws are not yet as clearly defined as they should be, nor as they will; nevertheless, the fact that there are such should give us confidence in the use of the material, because we may be sure of reaching reliable results by the proper observance of the laws; therefore, there is no good reason why engineers should be afraid to use steel if they manipulate it intelligently.

**AN ELECTRIC HAMMER.**—The Siemens "electric furnace" of last winter has now been supplemented by an electric hammer, the invention of Messrs. Siemens and Halske, Berlin. The device consists of three hollow coils of insulated wire having a movable core or rod of soft iron, which is free to move up and down under the axial attraction of the coils when a current circulates in them. The central coil is traversed by a constant current which magnetizes the rod or hammer, and the two extreme coils are traversed by alternating current from a dynamo-electric machine in such a manner that they alternately attract and repel the magnetic rod up and down so as to make it beat like a hammer. The range of blow is limited on one side by a spiral spring placed within an elastic cushion. Of course a very great rapidity of action can be given to the hammer, while the arrangement is apparently applicable to working a rock drill.

**TO HARDEN STEEL.**—A very fine preparation for making steel very hard is composed of wheat flour, salt and water, using, say, two teaspoonfuls of water, one-half a teaspoonful of flour, and one of salt; heat the steel to be hardened enough to coat it with the paste—by immersing it in the composition—after which heat it to a cherry red and plunge it in cold, soft water. If properly done, the steel will come out with a beautiful white surface. It is said that Stuhls' files are hardened in this manner.

**NEW FRICTION PULLEY.**—A. T. Arnold, Fitchburg, has recently patented a friction pulley, which is a combination with the loose pulley, segmental friction shoe, and a split ring encircling the base of the pulley. Levers are used, which throw the segmental shoes in contact with the inner surface of the pulley face, and forces the split ring into engagement with the hub. This is a peculiar combination, and we should judge it would be very effective.

**PROTECTING IRON FROM OXIDATION.**—Mr. A. Reid, London, places the iron to be operated upon in a properly constructed furnace, and completely covers its surface with soot, or other matters composed of the same elements and having similar properties; the temperature is then raised to a red or white heat, and continued for 15 or 30 minutes, or longer, according to the mass of iron to be operated upon; it is then removed from the furnace and allowed to cool; the surface is then thoroughly cleaned, and is found covered with a coating which is impervious to rust under ordinary circumstances.

## SCIENTIFIC PROGRESS.

## Stones Clinging to Under Side of Ice.

G. M. Philips, of Lewisham, Penn., communicates to the *Scientific American* his ideas in regard to the not uncommonly observed phenomena of stones found clinging to the under side of ice. This is often seen where the water is several ft. deep; but never, we believe, in still water, and usually in very rapid running streams of from two to four ft. deep. This phenomena was displayed the past winter upon a very large scale in the Susquehanna river, near which Mr. Philips resides. Mr. P. writes: "More than 200 years ago Dr. Plot, of Oxford, Eng., described similar occurrences in the Thames, and gave at least a partial account of their true cause. It is well known that water, like most other substances, contracts under the influence of cold until it is reduced to a temperature of 39°. But if its temperature is lowered still further it expands until reaching 32°, when it freezes, by which its bulk is increased much more than by its cooling from 39° to 32°. Hence it is that water begins to freeze at the surface, since, when near the freezing point, the coldest water, being the lightest, is found upon the top, and it is that which freezes first.

But when the weather is very cold, and the different parts of the stream are thoroughly mixed by rapids or some such mechanical action, the water may be about the same temperature at all depths, and he lowered altogether nearly to the freezing point. In this case the water will begin to freeze at the bottom, because it is still there, and perhaps because the stones and bottom have lost some heat by free radiation and by contact cool the water. Although so much lighter than the water this ice would not rise as soon as formed, for it would be frozen fast to the bottom and the stones lying upon the bottom. But as soon as its size gave the cake of ice buoyant power enough it would tear itself loose from the bottom and the larger stones and rise to the surface, carrying with it the smaller stones and gravel. Then it would be frozen in with the surface ice, keeping its curious load frozen fast to its under surface.

In November the weather became suddenly very cold, the thermometer sank to 3°, and the river here was frozen over in one night, a very unusual occurrence. Moreover, the places where the phenomenon occurred was just below the dam, where the current was swift and the river rather shallow. All of these would tend to mix up thoroughly the whole mass of the water. These circumstances seem to show the above to be the true explanation.

In the Thames, stones weighing as much as eight pounds have been known to be raised up from the bottom of the river in this way. Under favorable conditions, and acting through a long time, the ice, by carrying these materials down stream, must cause geological effects which are not inconsiderable."

**FUGITIVE SPECTRA.**—NEW SOLAR PHENOMENA. Trouvelot, in the observations at his physical observatory in Cambridge, during the past four years has examined the sun with a spectroscopic daily, whenever the weather would admit. On the 30th of August, 1877, at 2:30 P. M., he noticed for the first time a singular phenomenon. He was minutely exploring the solar circumference when suddenly, upon a group of brilliant protuberances, the solar spectrum was invaded with the rapidity of lightning and traversed by very brilliant linear spectra, which succeeded each other with great rapidity and ran through the whole visible length of the principal spectrum. He has subsequently turned his attention specially to these phenomena, and finds that they are of comparatively frequent occurrence. Their presence may be explained by two hypotheses. The first attributes them to meteors and the consequent disturbances which are supposed to give rise to the corona; the second looks to solar forces which are brought into play by unknown causes, producing profound disturbances accompanied by eruptions of incandescent materials, either solid or liquid, which are thrown in all directions to great heights in the solar atmosphere. Trouvelot inclines to the latter view, but he is continuing his observations in the hope of finding positive evidence to show whether the bodies which produce the spectra fall into the sun, or are ejected from it.—*Ann. de Chim. et de Phys.*

**INFLUENCE OF DUST AND SMOKE ON FOG AND RAIN.**—Mr. John Aitken recently read a paper before the Royal Society of Edinburgh on the origin of fogs, mists, and clouds. From a great number of experiments with moist air at different temperatures, to determine the conditions which produce condensation of water vapor, he concludes that whenever water vapor condenses in the atmosphere, it always does so on some solid nucleus; that dust particles in the air form the nuclei on which the vapor condenses; that if there were no dust there would be no fogs, no clouds, no mists, and probably no rain; and that without the beneficial influence of dust and smoke, which latter consists mostly of solid particles of carbon, the supersaturated air would convert every object on the surface of the earth into a condenser on which it would deposit as dew; lastly, that our breath, when it becomes visible on a frosty morning, and every puff of steam, as it escapes into the air from an engine, show the impure and dusty state of the atmosphere.

## Singular Discovery in Connection with Phosphorescence.

The property possessed by certain metallic sulphides and other phosphorescent bodies of absorbing light when exposed to its influence, and giving out the same when brought into a darkened room, has long been known to scientists, but it is only quite lately that efforts have been made to utilize such properties. Of these, the most striking consisted in spreading a sulphide of this nature upon a flat tablet and exposing it to a strong light for a few seconds under an ordinary photographic negative. Upon removing the tablet thus impressed into a dark room, the picture on it will be found to be glowing in quite a mysterious and wonderful manner, and it will continue for some minutes to radiate the light which it absorbed.

It has occurred to an ingenious physicist, A. L. Henderson, to mix one of the most sensitive of these phosphorescent metallic sulphides with the bromide of silver, now so generally employed in the preparation of photographic dry plates, and, after emulsifying this mixture with gelatine, spreading it upon the surface of glass plates, and treating the same as ordinary ones, except in so far as regards the exposure, which must be momentary. He appears to have reasoned in this way: With even the briefest exposure capable of being given, a certain modicum of change will be produced on the sensitive bromide of silver, although manifestly such as will be incapable of yielding a properly developed image. But the light also falls upon the atoms of the phosphorescent powder incorporated in the film; and as these in turn radiate such light, it follows that they will complete the imperfect exposure set up in the bromide by the direct action of the light.

This reasoning has been found correct, and the result at present stands that plates have been prepared having such exceeding sensitiveness as to be well impressed by what Mr. Henderson designates "the flash of a match."

Phosphorescent sulphides may easily be prepared by heating the carbonate of lime, of barites, of strontia, or other carbonate found most suitable, in a covered crucible with half its weight of sulphur. After an hour's exposure to heat, the preparation is complete and phosphori are obtained which, upon being briefly exposed to light and then withdrawn into a dark room, will be seen to glow brightly, the color of the light emitted depending upon the nature of the carbonate originally selected.

This application of a well recognized fact in phosphorescence is so novel, and calculated to be of so much use, that we have no doubt its progress toward development will be rapid.—*Scientific American*.

**EFFECT OF OIL ON EVAPORATION.**—E. Frankland, of the British Royal Society, says: "It has been frequently noticed that during fogs near large towns the air is not saturated with moisture, the dew point in one instance being as much as 10° C. below the temperature of the air. Seeing the possible connection between this phenomenon and the fact that the evaporation of water is greatly retarded by its surface being covered with a film of oil, the author made a series of experiments on the comparative rates of evaporation of water when freely exposed to a current of air and when covered with a film of oil or of coal tar or of coal smoke. It was found that the film retarded the evaporation from 92.7% to 66.6%. The results of these experiments point out a condition of very common occurrence, competent to produce "dry fog," while they also explain the frequency, persistency and irritating character of the fogs which afflict our large towns.

**PROF. BELL'S MUSICAL DISKS.**—Some French physicists contend that the musical notes produced by Prof. Bell in disks of mica, India rubber, metal, and wood, by holding them in the path of a rapidly interrupted beam of light, are really due to heat and not to light. M. Mercadier has obtained like sounds from ordinary gas lamps, without employing lenses to concentrate the interrupted beam, by simply bringing the receiving disk near the source of light. Even a plate of copper heated to bright red produced very distinct musical notes, which died gradually away as the plate cooled to a dull red. Disks coated with silver on the side exposed to the ray gave very feeble sounds, but when coated with lampblack the sounds were strong.

**SEPARATION OF COBALT AND NICKEL.**—Reibol gives the following new method for the qualitative separation of these two troublesome metals, especially when there is but little cobalt in the presence of a larger quantity of nickel. Both metals are precipitated with potassium hydrate solution and filtered. The unweighed precipitate is thrown into a test tube and heated with very strong potash until it boils. Under these circumstances the cobalt dissolves with a blue color, thus proving its presence in a very simple manner.

**A NEW COLORING MATTER.**—If carbon disulphide is agitated with semi-fluid sodium amalgam, and if the paste-like mass is mixed with water, there is produced a hyacinth red liquid, while mercury and mercury sulphide are deposited. The solution contains the sodium salt of a yet unknown acid, somewhat soluble in hot water, and more readily in alcohol. It dyes yellow, orange and brown shades on wool and silk.

## The Mining Share Market.

Although there was some little activity in Alta and one or two other stocks for a time, on Thursday, the market dropped back to what it is now, its normal condition—stagnation.

The Hale & Norcross folks are again at work on their lower levels as usual. Work will be resumed in the south drift on the 2400 level of the Potosi as soon as the rock extracted can be hoisted at the Combination shaft.

Connection will be made between the Yellow Jacket and Sutro tunnel within five weeks, when new life will be given to all mines of the group, as Crown Point, Belcher and Imperial. All these mines will at once be drained, when they shall have to raise the water no higher than the Sutro tunnel level.

The Bullion folks are exploring ground in which something is liable to be found. The ground is all fertile.

The Alta folks are doing good work in the way of sinking their main shaft, and it is passing through a lively and favorable formation.

Six years ago, during this month of 28 days, the yield of the Consolidated Virginia mine was \$3,682,000. The average of ore hoisted was 633 tons per day or 17,714 tons in all. This is the largest monthly output of any silver mine yet discovered, and no mine could be expected to last under such rapid exhaustion.

John W. Mackay, of the bonanza firm, is on his way hack from Europe, and it is said that he carries the control of the Sutro tunnel in his pocket.

### Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports :

Mt. Potosi, Feb. 17th, \$9,600; Northern Belle, 14th, \$8,082.42; Northern Belle, 19th, \$10,300; Christie, 22d, \$9,700; Germania, 16th, \$2,280; Orleans, 10th, \$1,283; Horn Silver, 16th, \$5,000; Germania, 18th, \$4,500; Horn Silver, 18th, \$12,500; Ontario, 18th, \$7,494; Mintie, 18th, \$3,278; Ontario, 19th, \$4,780; Horn Silver, 19th, \$10,000; Germania, 19th, \$3,660.

A LETTER from the Wood river country, Idaho, says in many places are to be seen the rifle pits and holes sunk in the bedrock by the first parties who passed through the country looking for Placer mines and fighting Indians. There were large parties from Boise Basin and Rocky Bar, who scouted through the country as early as 1844-5. In one place three skeletons were found in a rifle pit.

THE mining belt in Idaho is over 200 miles in width, and extends through Montana into the British possessions.

PACIFIC COAST APPROPRIATIONS.—The Sun-

dry Civil Appropriation bill, as prepared by the House Committee on Appropriations, and now awaiting passage by the House, contains the following distinctively Pacific coast appropriations: For continuation of the stone drydock at Mare Island Navy Yard, \$200,000; for Benicia Arsenal, to build machines, armorer's shop and store building, carpenters' and blacksmiths shops, \$50,000; for continuing artesian wells and for pipe and turbine wheel, \$5,000; for one timber-shed, \$2,500; for wharf repairs, \$2,000; for building freight house, \$1,000; for surveying private land claims in California, \$10,000; for surveying private land claims in Arizona and New Mexico, \$8,000 each; for contingent expenses of the Surveyor-General's office in California, \$4,000; for the same in other Pacific Coast States and Territories, \$1,500 each; for surveying public lands throughout the whole country, \$200,000, to be apportioned by the Interior Department; for the geological survey under Clarence King, \$15,000; for the coast survey of the Western Division, \$18,000; for the construction and maintenance of military telegraphs on the Indian and Mexican frontiers and in the Northwest, \$75,000; for the repair and preservation of government buildings in Alaska, \$8,000; for salaries and expenses of Treasury agents at the Alaska seal fisheries, \$7,770; for completing the erection of a first-class lighthouse and steam fog signal on the rock off Tillamook Heads, Oregon, \$25,000, to be immediately available.

THE *Post's* Washington special says: The Chinese Treaties hang fire in the Senate, and the failure of that body to act is creating some discussion as to its reasons therefor. One reason stated is that the treaties will affect the relations of the next Administration with the Chinese, and that it is only fair to leave its hands untied, and more time for consideration, in view of the facts that important restrictive legislation is proposed. Again, it is urged that the "most-favored-nation-clause" in the treaty yields to the Chinese the right to be naturalized, in opposition to the wishes and legislative enactments of the Pacific coast. Also, it is said that the treaty will not effectually stem the tide of immigration, as a large part—two-thirds it is said—of the Chinese immigrants are those who are returning after one term of residence here, and as such are not excluded. The provisions of the Commercial Treaty, governing the proceedings of mixed Courts, and the carrying of opium, are also meeting with some criticism.

McGARRAHAN.--The House Committee on private Land Claims have recommended the passage of the bill to confirm to Wm. McGarrahan all that tract of land in the State of California known as "Rancho Panoche Grande," save such portions as have been patented or settled upon with the intention, in good faith, of obtaining title under the laws of the United States. For these portions scrip for other Government lands is to be issued.

FOUR years ago Butte was a played-out mining camp. To-day it is the principal city in Montana. During the past year 200 houses have been constructed within the city limits.

UNDER the laws of New Mexico, mining claims must be recorded with the county recorder, whether there is a district recorder or not.

## AMADOR.

**TELLURIDE.**—*Amador Ledger*, Feb. 19: This mine, situated between Pine Grove and Volcano, is showing considerable activity. Two thousand ft of 11½-inch pipe is being placed in position to run the mill. The water is being brought from the Volcano ditch, which will insure a pressure of 200 ft. If this is found to be insufficient, an additional pressure of 95 ft can be secured by carrying pipe to the upper ditch. It is only intended to run stamps to start with, but there is room for 16 stamps more, should the development of the mine warrant the addition. There is plenty of rock in the mine, the only question to be decided is whether it is of paying grade.

**MISCELLANEOUS.**—Two hydraulic streams are playing upon the Grass Valley gravel claim, near Volcano. The auriferous bank is 15 ft in thickness, and is being washed away at a slow rate. The Amador Gold and Silver Co. has purchased the Monticlarich mine. There is a rumor afloat that the mine is to be started soon, but it cannot be verified at present. The shaft is said to be in a very disjunct condition.

**RICH MINE.**—*Dispatch*, Feb. 19: Messrs. F. Mace and John Ham are now taking out some extraordinarily rich rock from their mine near Mace's mill, a short distance above Volcano. They have on the dump about 100 tons which is said will yield at least \$60 per ton. It is not known how extensive the ore body is, but it has every appearance of being a permanent ledge of good width.

The big tunnel at Volcano has been pushed through but owing to some little "miscue" either on the part of the survivors or workmen, considerable work will yet be required before flumes can be put down for the mining operation.

**THE MONTEICHIARD.**—It is reported that the Monticchiard mine has been sold to a New York company and that the new owners are getting ready to start the mine up again in a short time.

**HENRY & RANDALL** have commenced operations on their gravel claim, near Aqueduct, on quite an extensive scale, and, we understand, with very flattering prospects.

**THE TELLURIUM.**—We understand that a new 5-stam mill is being put up at the Tellurium mine, near Pine Grove, and that the rock now being taken out is of excellent quality.

NOTES.—Croville Mercury, Feb. 18: P. R. Wells brought into this city last week a specimen of very rich ribbon quartz taken from a mine near Bangor. Thursday the Miocene company commenced work repairing the head end of their ditch, which was washed out by the late

head-dam of their drien, which was washed out by the flood. The telephone line of the Micoeno Co. is completed as far down as Thompson flat, and by Saturday wires will be in the main office. The ditches and flumes of the Frost & Reece mine were not damaged in the leak by the storm. There is now 2 ft of snow over the whole property. The water in the Banner mine has at last been pumped out, and on Monday evening the men were able to get down on the 300 level for the first time in 10 days. The Micoeno Co. have made arrangements whereby they are to have the use of about 800 inches of water from the Hendricks ditch. The water will be put into the claim

and work commenced at once. The Foultz amalgamate on the Miwewa mine, will be running by the last of the week. Mr. McSmith informs us that he has one engine to run the machine for 3 months, at the rate of 25 tons per day. That it will not be necessary to run a single level, only stop out what is in front of him. At a meeting of Oro M. Co., held in this city Saturday, the following officers were elected: J. M. Brock, President; L. D. Free Searcy; J. J. Smith, Supt.; J. J. Smith, R. Parker, D. R. Perkins and E. W. Slater, Board of Directors. The stock of this mine is steadily advancing. Mr. Perkins sold a few hundred shares for an advance of 60%.

**CALAVERAS.**—Rich Placer Claim.—*Calaveras Chronicle*, Feb. 19: W. are informed that a man by the name of Rivers, who thought what is known as Doak's ranch, situated about 8 or 10 miles southeast of this place, struck some very rich ground on the ranch. The ground, though not extensively reported to be exceedingly rich.

**PROSPECTING.**—A company of 8 Italians have commenced work on a quartz ledge, on the Whiskey Slide road, in the canyon extending from the divide at Buckeye to the Galena. The ledge is being run into the hill for the purpose of prospecting the lead. The tunnel is already over 80 ft.

**DITCH REPAIRED.**—The heavy breaks in the Mokolumuan and Campo Seco Water Company's ditch, occasioned by the recent heavy storm, have been repaired, and the ditch is again running its full head of water. The break caused a cessation of mining operations in the hydraulic claims for a few days.

**EUREKA HYDRAULIC.**—Work still continues with unabated energy in the Eureka claim, on the Calaveras river. With the exception of a day or two during the last heavy rainstorm, which occasioned some breaks in the ditch, no time has been lost. For 24 hours a day and 7 days a week, 2 pipes are kept in action, running 700 or 800 inches of water. Everything is progressing finely, and the owners, Messrs Cook Bros., are anticipating better returns than the claim has ever yet yielded.

**EL DORADO.**  
SPANISH DRY DIGGINGS.—*Georgetown Gazette*, Feb. 10.  
Our camp is by no means dead; on the contrary mining  
being vigorously prosecuted with good results in general.

There are a number of prospectors here hard at work, and from their conversation I should say that they are all satisfied with the outlook. The Walker mine is being worked by the same party as usual. Jake Burner and partners are plying on the Grit mine, and feel confident of a fine clean-up. Russ Davis recently picked up on his claim a quartz body of about 40 lbs weight, beautifully spangled and filled with gold. The Buckman Bros. are sluicing on the Georgia flat claim, and lately picked up some fine specimens out that ground. Louis Sites is sluicing to uncover seams on his Modoc ground, and has some good seams to his sight. Messrs. Slinger, Davis and Barr are sluicing on the Gravel claim, and clean-up in their surface diggings. Our Spanish residents are all busy, and show a goodly amount of dust as the result. Messrs. Simpser & Hines are very busy with a force of men clearing away a land slide near the head of their ditch. There is a prospect of capitalists taking hold of some of our good old mines, such as the Slinger, Davis and Barr, which have really only been scratched on the surface, yet have paid so largely. There is big pay in those claims awaiting some lucky investors.

**INYO.**—For *Saline*—*Inyo Independent*, Feb. 10: Jerry McCarty's prospecting in the new Saline district has resulted already in attracting the attention of such well known mining operators as Dwight Crittenden, of the Mammoth and Jeff McClellan, formerly prominent on the Comstock. These gentlemen, under guidance of Mr. McCarty, passed through Fish Lake Creek and Big Pine last Wednesday, and from there across the Inyos to Saline valley. They have some of the most important locations under bond, and seem so confident of being satisfied with them after examination that they have already ordered an ample supply of mining material to vigorously prosecute work.

**MARIPOSA.**  
**MERCED HYDRAULIC Co.**—*Mariposa Gazette*, Feb. 16.  
 We learn from reliable sources that the prospects of this company at this time are really better than first anticipated. In the new cut which has been run, the back channel or old bed of the river has been struck, which from appearances and pay prospects of the extensive haul of gravel, the company has a bonanza that will be a per-

ment thing for years to come. Since the commencement of the rainy season more gravel has been washed altogether than of last year. The fact of finding the river bed or channel is a "dip" of great value to the company. The rainfall in this section, amounting to 12 inches, is greater than anywhere else in the country, and a scarcity of water for the purposes of this country, for a year or two to come, need not be apprehended.

**NEVADA.**  
**GRAND QUARTZ.**—*Tidings*, Feb. 10: Supt. Lord went down from the mine on Wednesday, and reports everything in good shape there. The stopes are holding out the same as usual. The main lower drift shows a 20 to 25 inches thick of good looking quartz, and it grows larger as they drive into the mountain. The mill is kept running all the time, and he hopes soon to have the mine a dividend-paying basis.

**THE JOHNNY MINE.**—*Overland Alta*, Feb. 10: Supt. Lord is now at the mine, and is bringing to surface 50 tons of gravel daily, which is run through stamps for the more perfect extraction of the gold therefrom. A new drift has been opened, which is turning out good gravel.

**ALBION RANCH.**—This old mine, from which about 600,000 lb of gold was extracted in its prime days, and about which here believes it was half worked out, has been abandoned for the eastern market. It is expected that the mine will be resumed about the coming summer.

**PETRIUS IN MOUNT MONTE.**—*Nevada City Transcript*, Feb. 13: The Blue Tent and Safford Flat hydraulic companies are making things fairly "hum" out their way, under big new monitor for each claim has just arrived via the Narrow Gauge railroad. These mines annually produce thousands upon thousands of dollars' worth of bullion, not one cent of which goes to the "foreign countries" that are so much the business of the mining companies. The companies owning them contribute greatly to the prosperity and wealth of Nevada City, and eventually the good of the State at large.

**THE KIRKHAM MINE.**—*Nevada Transcript*, Feb. 20: The miners of the Kirkham & Hitchcock claim, at Blue Tent, have their new incline down 120 ft, and are following the ledge, which is 1 ft thick and very compact, through hard rock. The poorest rock recently from the ledge in this claim, has yielded 80 to a ton, while numerous "sugar plums" are found where it pays as high as 50 cts a pound.

**PROSPECTING FOR THE BIG WHITE LEAD.**—The Pearl mine, Tom and Jack, have a force of 6 men engaged in mining a tunnel into Cement Hill, at the head of Long ravine, in the hope of recovering the old Cement Hill lead, which was lost several years ago by the original company after considerable gold had been taken from it. The tunnel is being run by different parties in the hope of finding the continuation of the channel.

**LOS RIOS CO.**—*San Juan Times*, Feb. 19: The Lone Ridge M. Co. are pushing their work to a state of completion very rapidly. They will complete their tail-flume and undercurrents within the next 2 weeks, probably. Their ditch, which commences at or near Kilroy's ranch, at Clerke, is nearly completed. About 200 ft of 15-in iron pipe has already been laid down and the manufacturing of pipe still goes on.

**LACER.**  
**NORTH RAVINE.**—*Placer Herald*, Feb. 10: The Crandall mine is being worked by J. R. Maine, who, we understand, has out several tons of very promising looking rock. Roberts & Roberts, having been driven out of their shaft surface water, are engaged in running a tunnel to tap the ledge, the lay of the country being very favorable for such an undertaking. Keenhor & Crosby, on the east extension of the Shurtliff, have struck rich ore, and have very prospect of a very good mine.

**THE MYSTIC MINE.**—This is the name given to the late mine and shaft of Sam New, Nevada, showing very encouraging signs. They are down some 35 ft, the ledge of a good size, with even wall, the ore is uniform and will yield, it is thought, from \$30 to \$40 per ton. **IMPORTANT PURCHASE.**—The Schnabel boys, August H. and Adolph, have purchased from Geo. D. Aldrich the old Patrick mining property, including the famous Orater mine and hoisting works, the excellent 15-stamp mill, and the burning house, which the other proprietors have been holding out for sale. They have already over 40 men at work and are running the mill to its full capacity. The Schnabels are a steady, industrious and energetic young men, and are of first class miners, having been raised virtually in a quartz mine. They will give their personal attention to the management of this property.

**LUMAS.**  
**SAVROCK.**—*Greenville Bulletin*, Feb. 19: The new mill is in active operation, and doing good work, to the satisfaction of the Superintendent and owners. **ORENS MOUNTAIN.**—The breaks in the ditch, mentioned last week, were repaired last week, and both mills are running.

**INDIAN VALLEY.**—The working tunnel is being driven as fast as labor can forward it. Owing to the stopes not extending as far as thought of in the beginning, more time is required in making the connection. A full force of men are retimbering the Indian Valley shaft from the 200 level. The mill is in complete running order.

**LUMAS NATIONAL.**—The sulphurets works recently built at this mine, on Wednesday last, and works splendidly. The huge revolving furnace runs perfectly smoothly and fully up to expectation. The chlorination of the roasted sulphurets have commenced, and in a few days the whole process will be successfully running. Assays show the sulphurets to be valuable, and now that the company has the means of treating them, will soon make a profitable mine again. This is one of the most important of a lot of mines now being constructed in this section of the State, and the company has our best wishes for its success.

**GRANITE BASIN.**—Lively times are expected next spring. There are several rich claims in the Basin, 5 of which are quartz mills now up, or in process of erection. Among them are the following: See & Jolly, 4 stamps; Vard & Co., 8 stamps; A. P. White, 8 stamps; Amest & Co., 10 stamps; Morgan Williams, 10 stamps. The latter company, which has put in a complete mill, and will be ready to start as the weather will permit. In the mill of Amest & Vard, after a six days' run, the small little sum of \$400 was produced. The sulphurets are quite rich, and evidently will require the use of concentrators and a furnace. In this connection we would remark that we believe the general introduction of concentrators and furnaces in localities where sulphurets abound, will result in a much larger yield of bullion. They are rapidly showing their utility.

## SAN BERNARDINO.

**OUNSIOR.**—It is now reported as a fact that the celebrated Lost Sunlight lode has been found by a prospector named by D. O. Mills. He is said to have become possessed of a lot of old papers and charts, including a description of the locality in which the unfortunate Dutch Valley party found the renowned lead. It is said to be about 60 miles from Resting Springs, in San Bernardino county. The lode discovered is from 20 to 30 ft wide, and crops out 20 ft, and has been traced for 3 miles. It was always a cherished desire with the remnant of the unfortunate party, most of whom perished in Death Valley in 1849, to find the lost lode. The late John Smith, who was one of the party, was always enthusiastic about the lost lode. He was one of the original discoverers, and was firm in the belief that it was the richest mine ever seen by man. "If it is within only 60 miles of Resting Springs," adds the same paper, "it is astonishing that Josh Talbot, or some other of the survivors of the desert have not stumbled on it." Under the lost lode has been seen a number of buried times in the course of his prospecting wanderings during the past 25 years. "We do not think they have got the right Sunlight yet; it is in a small detached mountain, the nearest water being about 25 miles distant. So one of the original discoverers told the writer hereof years ago."

## SIERRA.

**BLACK JACK.**—*Nevada City Herald*, Feb. 17: Supt. J.

W. Young, of the Black Jack mine, which property is situated a short distance from Forest City, is losing no time in developing this valuable claim. The rock in the tunnel that he is now driving being very hard and preventing rapid progress being made, he has concluded arrangements for putting in a Burleigh drill, which is to be worked by water power. The compressor will be geared on the mill wheel some 500 ft below the mouth of tunnel No. 3, where the men are at present working. Said tunnel is now about 200 ft. After starting the Burleigh drill, Supt. Young anticipates cutting the vein in 40 or 50 days, or when time the mill will be completed. From that on, he says, the mine will yield dividends. At present there are 10 men employed, and the adoption of the Burleigh drill will not necessitate the increase of labor; consequently there will be no extra expense attached, more than the purchasing of the drill. The progress of driving the tunnel will be increased by 5 or 6 ft a day as to that heretofore.

## TUOLUMNE.

**DISCOVERIES.**—*Tuolumne Independent*, Feb. 18: We have been told of some fresh, rich discoveries in the upper belt, in proximity to the Gold Hunter mine. The ledge has been traced for 3,000 ft, showing gold freely. We examined some really magnificent specimens from the celebrated Osen mine. This is really a wonderful discovery, and the fact that the ledge had been traced for 3,000 ft in this mine in all and every form. The Spring Gulch mine is drenched out, and will not attempt to do more work until the storms are over. Regarding the Knox & Boyle, on the mother lode, we hear that they are about to rebuild and enlarge the over-shot wheel of this company to 40 ft diameter, also thoroughly overhaul the 10-stamp battery to be used as a prospecting mill.

The Republican almost ran, on the mother lode, near Jacksonville, has been purchased by Mr. William Lenon for \$300. The property, under the ownership of the present gentleman, will be speedily developed. He will have a good head of water until July next, and purposes to wash off all the free gold that is known to exist in the decomposed slate matter and quartz veins, which will doubtless pay well.

The Sonora mine is crushing at Seiber's mill. Plates look well for good pay in free gold. The concentration is doing good work.

**KENNEBEC HILL.**—"It never rains but it pours," says a Columbia correspondent: John Griffin and John Gerber have struck a good pocket lead on Kennebec Hill, across Main gulch. They obtained \$90 in one pan; since then they have been taking it out very rich. No one knows the exact amount, as they have quiet tongues; Dame Rumor has it all the way from \$2,000 to \$3,000. He further says: "The outlook for the coming season in this section in mining matters is very flattering. A number of mines have been sold to capitalists, and a great many have been bonded by various parties, and he looks forth to a genuine mining boom—one that will inaugurate a proper system in mining matters."

**SOUTHERN MINE.**—Mining operations are at present down to zero in this vicinity, but with bright prospects looking up in the spring, we still have for the "good old time coming." The reduction works have shut down for the present, on account of the bad weather, the roads being in such a condition that it is impossible to haul quartz to the works. The Monte Cristo mine has also ceased operations on account of the water coming in faster than it can be hoisted with the windlass. The company is about to put up an engine on the mine, when operations will again commence.

## NEVADA.

### WASHOE DISTRICT.

**UNION SHAFT.**—*Virginia City Enterprise*, Feb. 20: Cutting at this station, on 2000 level, repairing drift at 1600 level, and easing timbers at the 1900 and 2500 station.

**UNION CO.**—On the 2500 level the joint Mexican west crosscut has been extended 10 ft; the joint Mexican east crosscut has been advanced 20 ft, and the joint Sierra Nevada east crosscut 25 ft.

**OPHIR.**—On the 2500 level the joint Mexican east winze has been sunk and timbered 18 ft; the joint Mexican west drill hole has been extended 170 ft, cutting at timbering. The joint California east crosscut has been extended 49 ft.

**HALE & NORCROSS.**—The reconstruction of our hoisting works is completed. Have been for the past week engaged in cleaning up the shaft and incline, and find the ho-bits considerably damaged. The slower and compressed air pipes will have to be replaced for about 700 ft in the shaft.

**MEXICO.**—On the 2500 level the joint Ophir east winze has been sunk and timbered 18 ft; the joint Ophir west drill hole has been extended 170 ft.

**SIERRA NEVADA.**—On the 2300 level the upraise has been advanced 22 ft; total length, 562 ft. Ore raised during the week, 322 tons; average assay value, \$101 per ton.

**ALTA.**—Since last report the shaft has been sunk and timbered 25 ft. Water in the shaft is increasing threefold, owing to the Silver Hill company pumping it into the Justice company's works, all of which runs through into the Alta company's shaft. I have notified the Superintendent of the Justice accordingly.

**CALIFORNIA.**—On the 2500 level the joint Ophir east crosscut has been extended 40 ft; the joint Con. Virginia west drift to the C. & C. shaft has been extended 34 ft; and the joint Con. Virginia east drift from the C. & C. shaft has been advanced 11 ft.

**CON. VIRGINIA.**—On the 2300 level the south lateral drift has been extended 5 ft, and are now cutting out a chamber for the joint Best & Belcher upraise.

**SUTRO TUNNEL.**—Main Tunnel—General repairs have been made along the main line. North Lateral—During the last week it was found necessary to do very little work in this drift to keep it in repair. South Lateral—The retimbering and repairing has been continued, and the faces are ready on the 14th inst., and work resumed in driving ahead. The repair shifts were engaged a portion of the time in easing and doubling up the timbers for a distance of about 50 ft, which were put up the week previous; also 30 ft of ground has been cut out and retimbered. The west half of the face is in adit, and the east half is in decomposed porphyry, with clay seams. The hot water is decreasing.

**EXTRA.**—The face of the tunnel, 3,500,000.

**YELLOW JACKET.**—During the past week have extended the Suto tunnel level drift 80 ft, making the present length of the same 420 ft from the switch, or 400 ft from the center of the shaft to the face. The ground continues quite dry, with numerous clay seams. We are obliged to keep the drift well timbered close up to this face. The Suto Tunnel Company has resumed the work of driving in near the south leader. The distance between the 2 faces is about 450 ft. Machinists are employed on repairs to the pump engine. Both centers or disks of the new fly-wheels are in place and keyed.

### ESMERALDA DISTRICT.

**NEW ESMERALDA.**—*Herald*, Feb. 19: Work still goes on in developing this property, and every day's work done makes the mine look better. In the bottom of the shaft sunk on the Helen No. 2 claim, the ore is very rich, and shows gold very plainly. A drift is now being run from the ravine that crosses this claim into the main hill. Another man was put to work to-day on this property, making a force of five men at work at present.

**EXTRA.**—The incline is down 55 ft, and a drift has been started on the ledge running to the main ledge.

### EUREKA DISTRICT.

**BOSTON & EUREKA M. Co.**—*Sentinel*, Feb. 19: A company has been organized in Boston under the above title, and have purchased the Ventura series on the north side of Adams' Hill, and the work of developing the property will be begun as soon as the weather permits. The number of shares is placed at 125,000, at a par value of \$4. The mine will be under the supervision of Mr. Nathaniel Diamond, one of the most thorough and practical miners in the district, and who made the Ruby-Dunderberg a successful and dividend-paying mine.

**THE NORTHWESTERN.**—The recent developments in the Albion prove that the trend of the ledge is into the above property, and that the stockholders are somewhat jubilant.

The indications are that it will yet prove a valuable mine.

**SMOKER IN THE EUREKA CON.**—The Eureka Con. has been affected by the smoking argument now going on between the Richmond and Albion, the fumes having penetrated the mine through its connection with the Richmond. As yet it is not serious, but sufficiently unpleasant to make the miners wish that other tactics had been resorted to.

### MILLER DISTRICT.

**NEW MINES.**—*Cor. Plumas National*, Feb. 19: I just saw a man here who had had money made in the new mines in the Miller district, 100 miles east of here, and 70 miles from Wadsworth. His reports that new discoveries have recently been made which promise to be very rich. There is little doubt but what there will be a big rush there in the spring. Ten or fifteen men are stopping there permanently, with many coming and going all the time. No feed for horses nearer than 25 miles, and the "houses" are burrows carried in the hills—covered with canvas. Lumber will have to be transported from Wadsworth. There is plenty of juniper, but no other timber.

### ARIZONA.

**SHUT DOWN.**—*Arizona Citizen*, Feb. 13: The Con. Arizona mill, at Arivaca, has been shut down, probably for a month or two, pending settlement of some company difficulties. The men were all paid off, and a number of them arrived in this city this morning. Supt. McCafferty is here, en route to New York.

A new mining company has been recently organized in New York to open a group of mines in the Sierritas.

Many fine prospects exist in those mountains, and the developments anticipated at the hands of this planter company are expected to give that region quite a mining boom.

**CALIFORNIA DISTRICT.**—The Texas mine is still being developed rapidly as much money can be accomplished. It is becoming more valuable daily. The main shaft is now down 140 ft, with drifts at 95 and 100 ft. There is also a tunnel in 110 ft, which requires but about 80 more to tap the ledge at a depth of 240 ft. The smelter to reduce the ore of this mine is now daily expected, the grading having been completed, timbers on the ground, coal burned, and everything in order to commence operations immediately upon its arrival.

Several other companies are being organized to work mines in the vicinity, 2 of which, the Chiricahua company and the Congressional mining company, the former of California and the latter an Eastern company, have already secured a number of fine prospects. The Roman Beauty mine, owned by the Congressional company, is considered as fine a prospect as there is in the camp. This company has also secured a number of others that are prospectively as valuable as any in the Territory, not excepting those of Tombstone. Besides the mines of these companies, there are from 500 to 1,000 locations, nearly all of which have more or less work done on them, and many of them showing as well as any that have been sold. In fact, there are mines enough here, where the prospects are sufficient to warrant extensive development, to keep busy 20 companies instead of 3, and we will have that many, too, within 3 months. The prospectors are nearly all at work on their claims, getting ready for the boom which is sure to come with warm weather and Eastern railroad connections. Galeville is fast assuming the proportions of a metropolis, there now being half a dozen stores, 3 lodging houses, a first-class hotel, and restaurants and saloons almost without number.

### COLORADO.

**KERBER CREEK.**—*Cor. Silver Cliff Prospect*, Feb. 11: The snow is fast disappearing at Bonanza, but information comes from Little Kerber that in that vicinity "the beautiful" is about 3 ft deep. In all probability no prospecting can be done until the first of April. The Columbia and Betty Boy claims in the vicinity of Little Kerber, are both showing very well in sulphurets. It is reported that the former was sold to Denver parties for \$10,000. The East Eastern, down 10 ft, a well-defined lead, carries rich silver, a picked assay from which gave a return of 2,600 ounces per ton. The Tiptop, Crosscut, and Superior lodes, in Rawley Gulch, near Bonanza, are being actively worked, and are all showing up finely. The latter has an 8-ft vein, of which has been struck in the Mount Joy, in the same locality, is down 50 ft, and shows a large vein of galena and gray copper, running on an average about 60 ounces. At 7 ft the highest assay was but 7 ounces. The Commonwealth company, of Ohio, represented here by Major I. N. Strong, has a fine group of 15 claims at the head of Alder creek.

**QUERINA.**—I have come to the conclusion, after considerable observation and study, that what is most needed here is a concentrating mill. That the mineral is here has been demonstrated beyond a doubt. If some one with capital would come here and erect a concentrator, it would pay handsomely on the investment, and prove a God-send for the camp. If the mill was located near what is known as Poison Springs, there would be a sufficient supply of water, and it would be surrounded on all sides by the numerous rich mines on Dutch Flats, which would all have the advantage of shipping the ore down hill. The Mountain Boy claim alone, the ore in which is low grade, would keep one mill running. We have mines enough here in which there are enormous quantities of low-grade ores, to keep several concentrators running night and day, and certainly we have men enough who need employment. The Whistle mine, owned by Melrose & Beta, has been sold to the Bell company for \$75,000. Briggs & Day have struck it rich in the Mid. light lode. The Belle of the Gulch and Copper Bottom lodes are attracting considerable attention, and all the ground in the vicinity has been taken up as far as Gould's reach.

### IDAHO.

**CUSTER.**—*Yankee Fork Herald*, Feb. 12: The bum and rattle of the General Custer mill stamps is the music that now salutes the Custerites' ears at all hours of the day and night. It is the right kind of music, for it is silvery tones. Col. Hyde is kept busy in keeping everything in running order at the mill, but he knows his business, and everything is working well.

**YANKEE FORK.**—Several Yankee Forkers are in the East for the purpose of selling mines, and some transfers are looked for soon. The clean-ups from the Custer mill will be an incentive to capitalists to invest in our midst, and will help the agents in making sales. Those who wish to sell mines should not get excited and ask visionary prices for their ledges. They should ask what they are really worth—dead just as they would in selling stock or merchandise. If such a course is pursued, several sales will undoubtedly be made, and we have a boom in a few months that is a boom.

**ORE.**—We understand that a vein of fine ore has been struck in the Silver King mine, owned by Samuel Holman, James Donnelly and Oliver Blawett. The location of the mine is northwest of the Custer City.

**WOOD RIVER.**—*Cor. Salt Lake Tribune*, Feb. 16: This town of Ketchum, from where I write, has more natural advantages than any town on the river. This place is destined to become the base of supplies for the mines above here. We have a good saw-mill, 3 miles above town on the river, and a few good sites for smelters; and plenty of timber for building purposes. There is also a smelter, to be run by Salt Lake parties. We have plenty of ore on hand, and expect to have enough to run 2 or 3 smelters. Our winter has been mild so far, very much like the winters in Utah, excepting a little more snow. Our camp is full of life, fun, and business. Miners are coming in daily for their supplies on snow shoes. One can carry from 40 to 60 lbs, and can travel from 15 to 20 miles per day.

**APRIL.**—*Idaho World*, Feb. 12: The shaft sunk last fall by the Elmira company, at Banner, was tapped 2 or 3 days ago by the tunnel that was started in for it about the middle of last November. The men at work in the tunnel were notified by the seepage of water that only a few feet would have to be run to make the connection. A

hole was drilled in a distance of 10 ft and 7 sticks of giant put in and fired off. This stopped the seepage, and one of the men commenced picking. A few licks tapped the shaft, and the water started, likewise the man with the pick and two who were filling up the car. It was a race of 350 ft. The water rushed through furiously, but the men made good time, and reached the mouth of the tunnel a little ahead. The force of the water started a lively current of air—so strong that the men could scarcely keep on their feet. The back set of timbers was carried away and the car smashed to pieces. There was 80 ft of water in the shaft, besides 110 ft of tunnel, leading from the bottom of the shaft to the ledge, being full.

### MONTANA.

**THE ORANITE MINE.**—*Helena Independent*, Feb. 12: In November last this property was bought by Mr. Charles McCullo, in the sum of \$40,000; since which time he has had from 12 to 15 men at work on it, with results said to be entirely satisfactory. Our informant says "the mine was first run a distance of 115 ft in a 4 ft lode of free milling ore, carrying from 60 to 100 ounces of silver to the ton. Then a shaft was sunk at the mouth of the tunnel 67 ft deep, and from the bottom a level was run 70 ft in the same grade of ore between walls 4 to 8 ft apart. The shaft will be continued 75 ft deeper, where it will meet another shaft, through which the ore will be taken." The work contemplated will open up 20 ft of ground in which the ore, besides being rich in silver, carries from \$8 to \$9 of gold per ton.

The Hope company, under the supervision of Mr. Chas. Clark, is working the Emma mine, recently purchased from Holland & Estill, on Hope Hill. The Hope mine is abandoned—no ore in sight. On the Cliff mine this Hope company is working from 10 to 12 men.

**ALGONQUIN CO.**—The Algonquin mill is running on Salmon and Trout ore. No ore at present is being raised from the Algonquin mine, owing to the change being made from horse to steam power. The hoisting works just being finished for the Algonquin mine are among the best and most powerful ever erected in Montana Territory. The machinery was made by Orinith & Wedge, of Zanesville, Ohio, and is of the latest and most improved pattern. It is proposed to open the 000 level during the present year.

The Speckled Trout is being worked as usual.

**STEVENS MINE.**—One of the most important mining transactions in Butte for the past 6 months is the purchase, by Messrs. Daly, Pardee & Davis, of the Stevens mine. This mine has been a constant producer of ore for the past 4 years, and in that time has netted its fortunate owner, Mr. John Sisson, many thousands of dollars. The purchase price was \$300,000 cash, the purchaser taking possession at once, and are now actively developing the mine below water level. They are sinking 3 shafts. Should the developments meet expectations, Butte will soon have another large quartz district.

**THE EMPIRE, OF SILVER CREEK DISTRICT.**—An extension of the famous Drum Lummond, on the east. A shaft, now 60 ft deep, will be extended to a depth of 80 ft, and if the prospect, as estimated, the same good ore is found, a tunnel will be run to tap the lode at a depth of 200 ft. At present working, the lode is 4 ft wide, with the hanging wall well defined, and half the width of the vein matter is high-grade silver ore, and the entire distance carries gold enough to pay well.

The Alta Montana ores keep on improving in lead percentage, as well as in silver value. The mine is so dry as to admit of their keeping their ore in the open air, and the sediment which covers the product extracted from wet mines.

### NEW MEXICO.

**SOCORRO.**—*Las Vegas World*, Feb. 13: Col. T. B. Mills returned from Socorro yesterday. The Colonel reports the prospects in the "Wheel of Fortunes" are fully better than when the first strikes were made. The shaft is now down 84 ft and work is being rushed. The tunnel is being run into the side of the mountain, and has now reached a point 305 ft from its face, and if the dip of the "Wheel" shaft is as good as estimated, the shaft will be completed in about 100 ft further on. This will be reached in about 30 months, although the rock is growing harder and harder. An 8-inch vein of chlorides has just been struck in the tunnel, of the same grade as that found in the shaft of the Wheel of Fortune.

**SANTARITA MINE.**—North of the Aucon tunnel is located the above mine, and is owned by Antonio Aboytia and F. A. Manzanarez, of the firm of Brown & Manzanarez, at a depth of about 30 ft. A vein of ore 2 ft in thickness was struck of argenticiferous galena, assaying \$30 in silver and 60% lead per ton; they have considerable ore on the dump, and the prospects are very flattering that this may become a very valuable mine.

**SOCORRO TUNNEL.**—This tunnel crosses the mines known as the Strong, Wheel of Fortune and Chief Victoria. There are 13 men at work on both day and night shifts. The tunnel has reached a depth of 220 ft, and 136 ft of this work has been accomplished within the last month. At a distance from the face of 265 ft a lode of 1 ft in thickness, carrying chlorides of silver, was reached. The Chief Victoria mine has reached a depth of 50 ft in cap rock, the lode has not yet been reached. In going the above distance a vein 1 ft thick, carrying sulphurets of iron, was passed through, and the rest of the district was quartzite and lime-stone, filled with argenticiferous galena and iron pyrites.

The Socorro and Rufina mines are located north of the Socorro tunnel and are the property of the Manzanarez Mining and Industrial Co. Work will be renewed at once upon these mines.

The Franklin tunnel is north of last named mines, and the tunnel has reached a depth of 70 ft during the past month. A vein of low grade ore has been struck, but the vein looked for will not be reached under 100 ft from the present work. With the development of all the above mines and their close proximity to the railroad, being only 3 miles, no doubt the Socorro mountains will show the best paying mining district in the Territory.

**BLACK RANGER.**—No prospecting has been done since the first Indian alarm, the miners all remaining grouped together for common protection. Quite a number of miners are now making arrangements to send in men, who will undoubtedly be safe enough, as they will give the reds a high fight if they are tackled.

**THE MOGOLONS.**—The mines in the Mogollon mountains are showing up high, and rich strikes are being continually made. There are many old miners from Arizona and the Pacific slopes going in, and everything looks bright and hopeful. No Indians have, as yet, been seen in the range. The shaft of the celebrated Conney mine has been sunk to a depth of 220 ft. It is reported that a vein of wire silver 3 ft wide has been found in the mine.

**ROCK ISLAND DISTRICT.**—*Herald and Southwest*, Feb. 10: Lem. Andrews, who came in from Rock Island district last Wednesday, reports numerous locations and some developments in that vicinity. The ledge is well defined, and generally found covered with iron. The eastern slope of Cook's range is pretty well taken up. The ore is principally galena, with indications of running into sand carbonates. Assays of surface rock range from 30 to 40 ounces.

**TRES HERMANOS.**—Wm. H. Wray, who has just finished smelting and refining 2 tons of ore from the Cincinnati mine, Tres Hermanos, reports that he has struck a number of good veins, and that 100 ounces of silver to the ton. During the week he has received 2½ tons additional from the same mine. This last lot is better looking ore than the first and is literally full of horn silver. All the mines are looking well. The veins are opening out and showing a better class of metal as work progresses. The owners of the Hancock are making arrangements to ship a considerable quantity of ore to San Francisco. Numerous wells are going down and water is being struck in all the mines. There is a fair prospect that a smelter will soon be erected.

It is the intention of the Southern Pacific Railroad to build a suspension bridge across the Salinas river in the spring.

## Physical Studies of Lake Tahoe.—No. 9

[Written for the Press by Prof. John Le Conte.]

## Formula for Time of Oscillation of Seiches.

The researches of Forel seem to prove that "seiches" belong to that class of water-waves in which the wave length bears a large ratio to the mean depth of the water.

This mathematical investigations of Sir G. B. Airy, and other physicists, show that, under these conditions, the time of one semi-oscillation of such a wave is given by the formula— $t = l \div v \times g$ : In which

( $t$ )=Time of semi-oscillation of the "Seiche."

( $l$ )=Length or breadth of lake according as the "seiche" is longitudinal or transverse.

( $d$ )=Mean depth of lake, along direction of oscillation.

( $g$ )=Acceleration due to force of gravity.

The preceding formula shows that the duration of "seiches" is directly proportional to the length of the lake, and inversely proportional to the square root of its mean depth. Forel has shown that the results obtained by this formula accord approximately with the observations of "seiches" in Swiss lakes.\*

## Lake Tahoe.

From inquiries made of the inhabitants of the shores of Lake Tahoe, I was not able to discover that any rhythmic oscillations of the level of its waters have been noticed. Some residents declared that they had observed sudden fluctuations of level, which, from their suddenness, they were disposed to ascribe to disturbances of the bottom of the lake due to volcanic agencies; although they were unable to co-ordinate such oscillations with any earthquake manifestations on the adjacent shores. It is evident, however, that until arrangements are consummated for recording systematic observations on the variations of the level of this lake, we cannot expect that its "seiches" will be detected. Of course, self-registering gauges would give the most satisfactory results; but any graduated gauge systematically observed would soon furnish evidence of the phenomenon. For the longitudinal "seiches," "Hot Springs," at the northern extremity of the lake, or "Lake House," at the southern end, would be eligible stations for gauges; and for the transverse "seiches," Glenbrook, on the eastern shore, or Capt. McKinney's on the western margin, would afford good stations. As far as I am aware, "seiches" have never been observed in any of the American lakes. This fact is the more remarkable from the circumstance, that long-continued and careful observations have been made on the fluctuations of the level of several of the large Canadian lakes, with a view of testing the possible existence of lunar tides. Perhaps these lakes may be too large to manifest the unimodal rhythmic oscillations which have been so successfully studied by Forel in the smaller lakes of Switzerland. Be this as it may, there can be no doubt that Lake Tahoe is a body of water, in all respects, adapted for the manifestation of this species of oscillation, and that, like the Swiss lakes, it is subject to "seiches." Indeed, the far greater simplicity in the configuration of the basin of Lake Tahoe than that of the Lake of Geneva must render the phenomena much less complicated in the former than in the latter.

In advance of any observations it may be interesting to put on record the probable duration or period of oscillation of the "seiches" of Lake Tahoe. Such theoretical provisions or anticipations, may be verified or disproved by future observations, and in order to apply such tests, it is convenient to have numerical results presented to the observer. In the formula, previously given, expressing the time of one semi-oscillation of the "seiche," all the factors can be readily determined, in relation to Lake Tahoe, excepting the mean depth or ( $d$ ). For this lake we have the quantities indicated in the formula, as below:

( $l$ ) Longitudinal=21.5 English miles=34,600 meters.

( $l$ ) Transverse=12 English miles=19,313 meters.

( $g$ ) At latitude 39° and 1,904 meters above sea-level=9.794,808 meters per second.

The following table has been calculated by means of the formula, by assuming the several mean depths indicated in the table. The duration of one complete oscillation ( $2t$ ) is given in the table instead of the value of one semi-oscillation ( $t$ ), for both longitudinal and transverse "seiches" in Lake Tahoe.

LONGITUDINAL SEICHES.			TRANSVERSE SEICHES.		
D. in Meters.	2 T. in Seconds.	2 T. in Minutes.	D. in Meters.	2 T. in Seconds.	2 T. in Minutes.
450	1042	17.4	450	582	9.7
425	1073	17.9	425	599	10.0
400	1106	18.4	400	617	10.3
375	1142	19.0	375	637	10.6
350	1182	19.7	350	660	11.0
325	1226	20.4	325	685	11.4
300	1277	21.3	300	713	11.9
275	1333	22.2	275	744	12.4
250	1393	23.3	250	781	13.0
225	1474	24.6	225	823	13.7
200	1563	26.1	200	873	14.5
175	1671	27.9	175	933	15.5
150	1805	30.1	150	1006	16.8
125	1973	33.0	125	1104	18.4
100	2211	36.8	100	1234	20.6

From the soundings executed by me along the greatest axis of this lake (nearly north and south), the mean depth of water along this dimension cannot be much less than 400 meters;

this would make the time of one complete longitudinal "seiche" about 18 or 19 minutes. The mean depth along the transverse dimension is, probably, considerably smaller, perhaps about 250 meters; this would make the time of one complete transverse "seiche" about 13 minutes. As soon as the duration of these rhythmic oscillations has been accurately determined by observations, the problem may be reversed; for the time being known the same formula may be used for finding the mean depth of the lake along its two principal diameters.

\*Forel's monographs on "seiches" of the Swiss lakes may be found in the several volumes of the "Archives des Sci. Phys. et Nat." from 1874 to 1880. We cite the following: Tome 49, p. 24, et seq; Tome 53, p. 281, et seq; Tome 57, p. 278, et seq; Tome 59, p. 60 et seq; Tome 63, pp. 113 et 189, et seq.

(CONCLUDED.)

## Miners' Wages and Low-Grade Ores.

## The Situation on the Comstock.

The question of the reduction of wages of miners in camps where \$4 a day is paid, is one which is being widely discussed. The men and their unions naturally oppose the reduction, while the mine owners urge it. At Silver Reef, Utah, and at Lewis district, Nevada, wages have been reduced and some of the mines closed down because the men would not work for less than \$4 per day.

Probably at no other place is the question so absorbing as one at Virginia City. The majority of the Comstock mines are not paying at present, and if a bonanza is not struck pretty soon—and even if it is—the camp will, before long, have to fall back on its low-grade ores. In this connection the San Francisco Report recently, under the head of "Information Wanted," said: Suppose the miners' wages were to be reduced from \$4 a day to \$3, would work representing more than the \$1 a day to each man be done in consequence, and would a reduction benefit or injure the mining district in which it might take place? That, it seems to us, is the question. It is one which ought to be capable of discussion without the introduction of personalities or demagoguery. Which would be best for Virginia City, 2,000 men working at \$3 per day or 1,500 working at \$4 per day, and the other 500 idling or working on a railroad elsewhere at from \$2 to \$1.50 per day? Is there ore in the mines which can be taken out at \$3 a day which must be let alone at \$4 a day? Would the mines be developed more quickly and the chance of finding ore be increased by lowering the wages? These are queries we should like to see answered, just for the sake of information and to know upon which side common sense and ordinary business considerations lie. We do not want politics, personal prejudices or sentiment to come in at all.

The Virginia Enterprise of last week, in answer to the above, has the following interesting article:

In reply to the above we will say that it is not intended to reduce the wages of all miners and all men working in and at mines from \$4 to \$3 per day. However, taking the first question as asked, we will say that there certainly would be a vast deal more work done, and such a reduction would therefore benefit the district and the business men in it, because there would not only be more work done in the mines, but there would also be more men employed and more men, women and children to feed, clothe and supply with all kinds of necessities; yet it is not in contemplation to reduce the wages of all, even though it would be beneficial to have more work done and more men employed, as it is conceded that it is worth \$4 per day, and more than \$4 per day, for men to risk their lives and injure their health by working in very deep, hot or dangerous places. The question: "Which would be best for Virginia City, 2,000 men working at \$3 per day or 1,500 at \$4 per day?" we believe to be answered by merchants and business men of all classes who are standing idle at the doors of their shops half of the time, and who are depriving themselves and families of things actually needed in order to pay their rents and keep their heads above water, if it has not already been sufficiently answered above.

## Ore and Wages.

"Is there ore in the mines that can be taken out at \$3 per day that must be let alone at \$4 per day?" Undoubtedly. The management of the leading mines too well understand their business to not know to a cent when they are taking out ore that is running them in debt. For a long time the ore taken out of the California and Con. Virginia mines has barely paid expenses. It was taken out merely to give men employment and to give that much more gold and silver to the world. The men who worked in these mines very well know this. Scores of assays were constantly made, and the greatest care used in every way in order not to do injustice to stockholders by bringing the mines in debt. All the ore that would pay for extraction and reduction, and pay the men \$4 per day, was taken out, or so nearly so that it finally became necessary to discharge 80 men from the two mines. Undoubtedly more ore could have been taken out had the men employed been working at \$3 per day. As it was, at \$4 per day, whatever rich ore was found was made to extract a great deal of poor ore by judicious mixing. If men were working for \$3 per day would it not have been an easy matter to take out and add a corresponding amount of poor ore with the rich?

It is not in the old bonanza mines alone that low-grade ores are to be found that would pay for working were men now idle, and hopelessly

so, allowed to go into them and earn the wherewithal to feed and clothe themselves and families. In every mine in which there has ever been found a bonanza that paid to work with men at \$4 per day, there are now bodies of ore left behind that would pay to work with men at \$3 per day.

"Would the mines be developed more quickly and the

Chance of Finding Ore be Increased by lowering the wages?" In answer to this we will say that in accordance with the plan proposed by those who have considered all sides of the subject, that part of the work on the lode would go on just the same as at present. About the same number of men would be employed in shafts and at prospecting in the deep levels as now, and the chances of finding ore at great depths would be the same as now. There would, however, of course be a chance of men working in low-grade ore bodies on the old upper levels striking into deposits of rich ore occasionally, and some of these might prove to be of a good deal of importance. Large or small, all would help to bring up to a workable average a considerable amount of inferior ore.

As we cannot always have bonanzas to work, it is about time for something to be done toward working the low-grade ores left behind. Hundreds of men are now idle who would be glad to work in the old upper levels for \$3, or even less than \$3, per day. That they are not allowed to do so is not only a wrong and a hardship to them, but also a wrong and a hardship to all those of whom these men and their families would purchase supplies. It is not the miners alone who have interests at stake and rights worthy of consideration in a mining camp. The butcher and the baker, barely existing and hanging on in the hope of something better, are quite as worthy of consideration as any other class of laboring men.

## What Should be Done.

In order to bring about the desired change and give renewed life to the Comstock, there is not the slightest necessity for creating any trouble or ill-feeling. All that is required could be amicably and satisfactorily arranged. Therefore, we do insist that in view of the dull times, general stagnation of all kinds of business and many hundreds of idle miners on the Comstock, it is about time for the leading mine management and the head men of the Miners' Union to get together and come to an understanding, by means of which employment may be given to those who are now asking for it, whose wives beg for it almost on their knees, and whose children cry for bread because work is not to be obtained.

It should not be a difficult matter to so arrange as to let men go to work in those places along the lode where at present a miner is not seen, or ever will be, if things go on as now.

It is not in contemplation to ask a reduction of the wages of men who are working in the deepest levels, in shafts, and in other hot and dangerous places. Plenty of men are now getting more than the \$4 per day demanded by the Miners' Union. At least 70 men in the employ of the bonanza firm are getting \$4.75 per day, and at all the big shafts and works on the lode are a proportionate number of men who are receiving the same pay.

It is not intended to reduce the present

## Wages of Men Working in Shafts

Of any depth. About a mine there are many kinds of work to be done. Some kinds of work require to be done by experienced miners, and other kinds can be done by any one capable of handling a shovel, pushing a car or trudging a wheelbarrow.

There are in this city hundreds of boys who are growing up as hoodlums, or in danger of so doing, who should be allowed a place in which to learn something of the business of mining, and to earn something toward the maintenance of the families to which they belong. How many miners are there toiling in the sweltering lower levels, a portion of whose wages goes to feed, clothe and support sons who are growing up in idleness, and worse than mere idleness! A place should be found for these and for men who are unable to endure the heat of great depths at some place on or near the surface. This being the case, it would be well for the miners to allow the first 500 ft. below the surface to be worked by men and boys at less than \$3 per day. A son earning \$2 or \$2.50 per day—\$60 to \$90 per month—would add greatly to the monthly income of his father's family. In this first cool, dry space of 500 ft. would be found room in which many a stout lad could exercise his muscle, learn habits of industry and earn money.

From the 500 level down to the level of the Suto tunnel it is proposed to pay \$3 per day, from that to the 2500 level \$3.50 and to all below the 2500 level \$4, as at present. Men working in shafts, no matter how shallow, the same as at present.

In case an arrangement something as sketched above can be made we can promise that lively times will be seen again on the Comstock almost at once. Where we now see buildings pulled down we shall then see buildings going up. As things now stand capitalists can do nothing. It would be useless for them to put up mills for the reduction of the low-grade ores unless they can first make arrangements for mining them. Some have started the story that there is no

## Low-Grade Ore in the Mines

That can be made to pay at the present wages.

This is sheer nonsense. If the ore will not pay, on trial, that at once ends the matter, and there is no harm done.

All miners who know anything about the Comstock know very well that there are vast areas of ore that can be made to pay. Even now spots in the old upper levels are being made to pay with men at \$4 per day. If there are spots in these old levels that it will pay to mine with men at \$4 per day, the spots can be very much enlarged and a proportionately large number of men and boys employed if but \$2.50 or \$3 per day be paid. Some 20 men have for sometime past been at work in the old upper levels of the Crown Point, and through recent additions the forces now numbers 40. These men are taking out ore which it pays to send to the Carson river for reduction. Hon.

C. C. Stevenson has long had men at work in the old upper levels of the Kentucky, old Imperial and old Jacket. If there is ore in these mines that will pay Mr. Stevenson a profit with men at \$4 per day, then there must be a far greater amount that will pay for working at lower prices for wages, and more mouths can be fed and more money given to the world than now.

In this city there are vast areas of low-grade ore in the Ophir, Mexican, Gould & Curry, Savage, Chollar and all the mines that have ever had bonanzas that may be worked, provided an arrangement can be made by which employment may be given to men and boys at less than \$4 per day. The ore which would pay a profit at higher rates for wages has been taken out by \$4 men, or at least was supposed to have been, for then as now all ores reduced were carefully sampled and assayed, and class calculations were made to avoid running a mine in debt.

In the Gould & Curry alone from the cropping down to the Suto tunnel level there is sufficient low grade ore to give employment to a great number of men and keep a mill running for several years. Should an arrangement be made for working this ore a mill would at once be put up, thus immediately giving employment to millwrights, engineers and laboring men of all kinds. This mill would be erected near the mouth of the tunnel run sometime since by the bonanza firm and the Virginia and Gold Hill Water Company from a point near the old or lower Gould & Curry tunnel. This tunnel is already completed and in good order. It goes through to the west wall of lode, and from the west end a shaft has been raised to the surface, which shaft is well timbered and in good condition.

## To Cheaply Work the Low-Grade Ores.

In order to cheaply work the low grade ores in this part of the mine it is proposed to send down the shaft a sufficient stream of water to elude everything down to the mill through a flume of proper size. All that came through would pass into and through the batteries, in which the gold in the loose dirt would be amalgamated, while the pulp would pass through proper concentrating and amalgamating apparatus. The tunnel was given a very steep grade on purpose for this.

At the C. & C. shaft a mill is already erected that could be used with some little alteration; at other mines proper mills would be erected at the most convenient points, while in others it would be found best to send the ore through the Suto tunnel to mills on the Carson river. But this could not be done at once, as mills must first be built there of such great capacity as to speedily reduce great quantities of ore of the lowest grade. A thing to be borne in mind, however, in all these calculations, is that a royalty of \$1 per ton must be paid the Suto tunnel company, let the ore come from where it may, from the top down to the lowest level.

Bonanzas are all very fine when we can have them, but some provision should be made through which a reasonable level of prosperity may be maintained at all times. Men are foolish to refuse beef and potatoes and go hungry because they cannot feast on turtle soup. If there is a place for one man to earn \$4 per day, there surely should be a place where his needy neighbor may be allowed to go and earn \$3, or in proportion to his strength and skill, without his \$4 neighbor having power to command him to sit at home in idleness in the midst of his ragged and hungry family.

## THE ORIGINAL PROSPECTOR.—The Mining

News, of Ruby Hill, remarks that the original prospector who sallies forth into untrodden districts, with a pick upon his shoulder, is fast disappearing. "It is somewhat strange," says the News "that the most complete lexicon of the English language ignores the existence and occupation of one of the most salient types of humanity to be found in the world. This oversight is, perhaps, pardonable, on the ground that his advent is comparatively recent—dating back to no further than two or three decades. The prospector, as Lawrence Stern said of the homunculus, is 'a being guarded and circumscribed with rights, and is as much and as truly our fellow-creature as my Lord Chancellor of England.' As such he is certainly entitled to a definition in the family dictionary. The prospector is a strange being. The genuine variety is exceedingly nomadic, and the oft-quoted line, 'Hope springs eternal in the human breast,' applies with triple force to the prospector; indeed, the possession of unlimited faith is very essential to his profession. The sole object of his life is the discovery of mineral treasures, in whatever form they may exist."

## The Flouring Industry of the Pacific Coast.

We trust our friends will find the following items of information not only worthy of careful perusal, but preservation for future reference. Much pains have been taken to arrange them in a clear, concise, and connected manner. Our readers will find them historical, in many respects, as well as statistical. Many facts are brought to light not generally understood by the people at large, while we doubt not that manufacturers and dealers themselves may read the whole statement with profit and pleasure. For the fund of information contained in the article, we are indebted to Horace Davis & Co., of the Golden Gate Mills, of San Francisco. These gentlemen stand in the foremost rank among the flour manufacturers of the Pacific coast, and are doing much to add strength to the great thews of our rapidly growing commerce.

During the past four years there has been a marked revolution in the flour manufacture of the East. It was formerly supposed that the most economical and satisfactory way of reducing wheat to flour was to crush the grain between the stones, remove the bran, and pulverize the middlings at the same time. By this simultaneous operation, all the dirt upon the wheat, all the brash and the germs, pulverized by the stones, were necessarily incorporated in the flour. It was found that the wheat grown about Minneapolis, when treated by this method, could furnish but a second grade article of flour, although it was capable of being made into the best of flour when differently handled. The old treatment is known as the "low grinding" method. It was only when "high grinding" was introduced that Minneapolis began to recognize the value of her wheat and her water-power.

The phrases "patent flour," "middling purifiers," and "gradual reduction," now so familiar to millers, were there brought to public notice through elaborate experiments at Minneapolis. Their flour at once monopolized the markets at fancy prices. Those who utilized winter wheat, realizing that this system could not redound to their advantage as it had done to their Minneapolis friends, were slow to adopt the plan in their own mills. In the end it prevailed, however, and now but few mills at the East pursue the old style of manufacture. Doubts similar to those entertained by the winter wheat men prevailed here in California. Our millers, although they eagerly watched the contest between the two systems at the East, were doubtful as to whether the strife would ever reach this coast.

There are certain differences in the characteristics of wheat, which prevent the advantages accruing to the patent plan at the East from ever being realized here. And yet, there has been a steady progress in our own systems, and in the same general direction as those in the East. Such mills in this State as make high grade flour, have introduced purifiers, and very much improved their manufacture. These changes have not been in the direction of economy, and it has required faith on the part of our millers that good work would eventually justify them in risking heavy expenditures.

The white skin of California wheat, when pulverized in the flour, is not so conspicuous, nor does it injure the flour like the skin of the Eastern wheat. Hence, the differences between poorly and well made flour are not clearly marked here as there; nor do the prices obtained for a choice article here rule so high, relatively, as at the East. The encouragements for good milling is, therefore, materially lessened. Nevertheless, our people have not remained inactive. On the contrary, many of the better mills have been substantially modified within a few years past, resulting in a great improvement of their high grade flour. The number of patented machines, methods and processes which have sprung up during this activity enables the miller to exercise his judgment as to what best subserves his purpose.

Besides the common millstones, Eastern manufacturers are using "roller mills," in which the grain is crushed between chilled iron or porcelain rollers, either corrugated or smooth. Chilled iron disks are also operated like mill stones, for which inventors claim great advantages. Whichever method is used, economical milling demands middlings purifiers for removing the dust from that portion of the middling which escapes the crushing process, and the patents on these devices are legion. It will readily be seen that it is no easy task for a miller to substitute a new method for one which he has used for a term of years. No one change can be made without entailing others; and yet, these machines have steadily crept into our mills in the face of a general disbelief in their being adapted to California wheat. Middlings purifiers of the most approved patterns are to be found in all our best mills, while rollers have been used in a few instances for some years. Money has been freely spent in striving to determine how far Eastern experience has been of value to us, surrounded as we are by so many essentially different circumstances. These experiments are not as yet conclusive, but their effect will tend to the improvement of our brands.

While this struggle has been going on within the walls of our mills, a change has manifested itself in one of two great markets for California flour. Heretofore, Hongkong has been a sort of reservoir into which all our offal and low-grade flour has been poured, and highly advantageous prices have been realized. But greater familiarity with the use of flour, on the part of the Chinese, has resulted in a nicer discrimination, and that market now readily absorbs

higher grades at remunerative prices, while low grades assume a similar position to that which they occupy in our own markets. The good prices paid for high grades in China is a standing encouragement to our millers to improve their brands; and it may safely be asserted that Hongkong, so far as its capacity goes, will continue to absorb the brand of any mill which may choose to maintain its uniformity of excellence.

There were exported from New York, in 1880, 4,176,839 barrels of flour, and 560,770 barrels from San Francisco. Liverpool absorbed the greater portion shipped from New York, and 166,201 barrels from San Francisco. Were it not for the uncertainty introduced into the calculation by ships' charters, which, during a scarcity of vessels, uses up all the margin of profit between San Francisco and Liverpool prices, there might be some hope for this trade. But it must remain speculative until the day when regular packet lines, with regular freight rates, shall be permanently established.

The nomenclature of the grades of flour have been somewhat modified by the new methods of manufacture in the East. Patent flour, in the sense in which that term is used, is made exclusively from the best purified middlings; and in its manufacture, the primary effect is to convert the wheat into middlings, and not flour, the process of pulverizing into flour being reserved for a second treatment after the dust shall have been removed from the middlings. "New process" flour is another term sometimes used. This refers to the process by which the flour is made, and the intention is to convey the idea that the article thus produced is really a "Patent" flour. "Granulated" is another term. "Patent" flour is generally granulated. The better flours of the "Washburn Mill" and the "Crown Roller Mill" are very coarse and sandy. Hence, the general impression would be that a granulated flour would be a "patent" flour. There is little justification for the use of these terms or brands from manufacturers now or heretofore on this coast. There are many brands in which the proprietors take pride, and which, measured by the grade, may answer to the quality designated by the above phrases; but our millers have not as yet been converted to the new process, and they hesitate to revolutionize their machinery to the extent demanded by the new process. Hence, one who is disposed to carp at trifles might ask if they mean the same by these terms that an Eastern miller would imply by their use. If so, their use is not fairly justified in brands on this coast.

—Pacific Rural Press.

## USEFUL INFORMATION.

**BLACK STAIN FOR WHITE WOOD.**—A dull deep black stain may be imparted to white woods by the following process: Procure some logwood chips and boil them in water until a strong decoction of logwood is made; brush this over the wood with a soft brush, and allow the wood to dry. Treat it two or three times in this way, and then let it get thoroughly dry. While it is drying, prepare a solution of acetate of iron by soaking some flakes of iron rust or old rusty nails in best white vinegar. It may even be best to prepare this solution first. This may be brushed over the wood in a similar manner to that for the logwood dye, when it will be found to turn the wood a deep dull black. It has been said that a small quantity of nut-galls, ground to powder and boiled with the logwood, improved the decoction. A solution of protosulphate of iron (green coppers) may also be used instead of the acetate of iron. When the stained surface is dry, it may be varnished or polished with a rag smeared with a mixture of beeswax and turpentine, or polished with French polish darkened with a little indigo. The decoction of logwood should be used hot; the other solution may be used cold.

**BURNED CLAY FOR RAILROAD BALLASTING.**—The Chicago, Burlington, and Quincy Railroad Company are burning clay for ballasting their road. A small fire of bituminous Iowa coal is started on the surface of the ground, and, when burning freely, the fire is covered with a lump of clay, then alternately coal and clay, the coal decreasing in quantity until at the top it is as one to fifteen. The mass is formed like a cone. Three united cones, each 18 ft. high and containing in all about 1,000 cubic yards of material, have been started near Red Oak. They will burn for months. Six hundred miles of road are to be ballasted with this crude pottery broken up. It resembles coal cinder, but is harder.

**BLEACHING STRAW.**—Plunge the straw tissue into boiling water, and let it remain in about ten hours. After that treat the straw during three hours with a solution of common black soap, with such force that when taken between the fingers it gives a greasy feel to the fingers. The temperature of this bath is maintained at 75° C. Take the straw out of the bath, squeeze, and then submit it to the brimstone chamber.

**METALLIC BELTS.**—A patent recently granted in Vienna and Berlin uses bands of steel, tempered and hardened, to transmit motion from one pulley to the other, the faces of the pulleys being turned perfectly flat and then faced with a varnish of resin, shellac and asphalt. The fastening of these belts are of a peculiar structure and can not properly be described without engravings.

**NEW WORLD PRODUCTS AND THEIR EFFECTS.**—Mr. Goodyear, in his work on gum elastic, significantly remarked: "It is a very curious reflection that the articles which have most affected the commercial and financial resources and conditions of the nations of Europe have been chiefly derived from the New World. We allude to the potato, to tobacco, the precious metals and cotton, and another article has sprung up which bids fair to be as important—caoutchouc." Mr. Goodyear's anticipations have already been verified in a remarkable manner, but the future has far more in store for the world as the results of its introduction and economical application.

**LIQUID FUEL.**—The *Nautical Gazette* states: We shall soon be able to announce a wonderful stride in the mechanical appliance for using liquid fuel for generating steam in both marine and land boilers. The matter is in the hands of practical men, who will soon demonstrate that they can make from 28 to 30 gallons of crude petroleum, costing from 80 to 90 cents, do the work of a ton of coal, costing from \$4 to \$4.25, and without dirt or smoke, and when, as in the case of a large steamer carrying from 40 to 45 men in the fire-room, one man each will be abundantly able to keep up a uniform pressure of steam at all times.

**A NEW STYLE OF CARD FOR WOOLLEN MILLS.**—A new invention makes the teeth of cards a little more than one-half the ordinary length. It is claimed by this that so much stripping is avoided, and that the wire does not retain the dirt and fibers as any other teeth do; that the ordinary card teeth are longer than is actually necessary to the carding operation, which is effected by the extreme end of the teeth. The new process uses steel wire, tempered and hardened and flattened, or needle pointed wire; the cards seldom requiring grinding, are very durable, etc. The invention is of English origin.

**PROCESS FOR IMPARTING A METALLIC GLAZE TO FILAMENTS.**—This process consists in coating the textile with a sulphurous substance containing a metallic salt. The fiber is impregnated with a liquor containing in solution metallic salts; immersion imparts the shade and glaze of the metals. After this immersion, the fabric is exposed to an atmosphere containing sulphuretted hydrogen, to fix the coating and develop the metallic color.

## GOOD HEALTH.

## When to Eat.

Felix L. Oswald is contributing to *Popular Science Monthly* a series of very interesting articles on diet, in which he furnishes some pretty strong arguments against many of the very generally received opinions which have heretofore been entertained in regard to this important subject, by even the most advanced of the medical profession. From the last issue we clip the following:

"Never eat till you have leisure to digest, for digestion requires leisure; we cannot assimilate our food while the functional energy of our system is engrossed by other occupations. After a hearty feed, animals retire to a quiet hiding-place; and the 'after-dinner laziness,' the plea of our system for rest, should admonish us to imitate their example. The idea that exercise after dinner promotes digestion is a mischievous fallacy; Jules Virey settled that question by a cruel but conclusive experiment. He selected two curs of the same size, age, and general physique, made them keep a fast-day and treated them the next morning to a square meal of potato chips and cubes of fat mutton, but, as soon as one of them had eaten his fill, he made the other stop too, to make sure that they had both consumed the same quantity. Dog No. 1 was then confined in a comfortable kennel, while No. 2 had to run after the doctor's coach, not at a breathless rate of speed, but at a fair, brisk trot, for two hours and a half. As soon as they got home, the coach-dog and his comrade were slain and dissected; the kennel-dog had completely digested his meal, while the chips and cubes in the coach-dog's stomach had not changed their form at all; the process of assimilation had not even begun! Railroad laborers, who bolt their dinner during a short interval of hard work, might as well pass their recess in a hammock; instead of strengthening them, their dinner will only oppress them, till it is digested, together with their supper, in the cool of the evening. In a manner essentially similar, mental activity tends to hinder the digestive process for a considerable time; and I believe, more especially, the digestion of the very substances that are often selected as brain-food *par excellence*. Even after a fashionable dinner of six or seven courses (*courses*, Dr. Abernethy used to call them), two hours of absolute rest will set our wits a-work again; but if that time be passed behind a double-entry ledger, a feeling of lassitude, often combined with an almost resistless somnolence, will advise the brain-worker that his vital energy is needed for other purposes. 'I could eat with more comfort if it wasn't for the consciousness of having to hurry back to my drudgery,' I heard a poor class-teacher say, and the same consciousness embittered the noonday-meal of millions of school children and overworked clerks."

The writer holds that the principal meal should be the last, and that it should be taken from 4 to 5 o'clock P. M., after the day's work is done. We might then have "pleasant conversation, and four blessed hours for digestion," before retiring for the night.

"It is an important rule that we should digest our food thoroughly before we replenish the stomach." He thinks that two meals a day are better than three. We can accustom ourselves to swallow three, or even six; but we cannot compel nature to digest them between meals taken so frequently.

The Greeks and Romans, during their prime as nations, contented themselves with one meal a day. The Gonaque Hottentots are in no way accommodated by a five days' fast, and live to old age on an average of four meals a week. Two meals, or one full one and two half ones, should be enough for any man; the last at night. Such a custom will best enable nature to do her work most perfectly. Eating, like everything else, depends on training—habit—and in no other respect is the human system so plastic as to the influence of habit.

**NEW TREATMENT FOR VARICOSE VEINS.**—According to the *London Lancet*, Dr. Linon, of Verviers, has used per-chloride of iron locally with great success during the last three years in the treatment of varices. The strength of the solution is about two and a half drams to eight ounces of water. Compresses of flannel are steeped in the water, then wrung out, and applied by means of a flannel bandage, which is only moderately tightened. This application is to be kept on 24 hours, and on removing it the surgeon is much surprised to find that the venous dilations have almost entirely disappeared. The applications are to be renewed for seven or eight days successively, after which time the bandage is to be kept on, without any further wetting, until it gets loose. It is then to be wetted again with the solution, and applied until the varices have disappeared, which generally takes place after eight days or a fortnight, according to the size of the swelling. This simple method has removed, in a few days, enormous varices, which were accompanied by violent pain, with black spots on the surface, and have restored the use of the limbs. By the unsuccessful application of dry bandages only, Dr. Linon has been able to show that it is not compression, but really the local action of the iron which is efficacious.

**NEURALGIA AS A "WARNING."**—The great prevalence of "neuralgia"—or what commonly goes by that name—should be regarded as a warning indicative of a low condition of health, which must necessarily render those who are affected with this painful malady especially susceptible to the invasion of diseases of an aggressive type. It is always essential that the vital forces should be vigorous, and the nerve power, especially, in full development. Neuralgia indicates a low or depressed state of vitality, and nothing so rapidly exhausts the system as the pain that prevents sleep and agonizes both body and mind. It is, therefore, of the first moment that attacks of this affection, incidental to and indicative of a poor and weak state, should be promptly placed under treatment, and as rapidly as may be controlled. It is worth while to note this fact, because, while the spirit of manliness incites the "strong-minded" to patient endurance of suffering, it is not wise to suffer the distress caused by this malady, as many are now suffering it, without seeking relief, forgetful of the condition it begets, and the constitutional danger of which it is a warning sign.—*Lancet*.

**RESTORING THE DEAD.**—Prof. Fort has presented the question of premature interments to the French Academy in a paper on artificial respiration. One fact he mentions is, that he was enabled to restore life to a child three years old, by practicing artificial respiration on it some four hours, commencing three hours and a half after apparent death. A similar case is reported by Dr. Fournol, of Billancourt, who reanimated a nearly drowned person after four hours of artificial respiration. This person had been in the water ten minutes, and the doctor arrived one hour after asphyxia. Prof. Fort advocates also the utility of artificial respiration in order to eliminate the poison from the lungs and glands. The length of time it is desirable to practice artificial respiration in any case of apparent death from asphyxia may be said to be several hours.

**KEROSENE AND SALT FOR DIPHTHERIA.**—A correspondent of the New York *Sun* says: "In 1862, on a plantation in south Alabama, where there was great difficulty in securing good medical advice, I saw a whole plantation of blacks, as well as the white members of a large family, successfully treated for diphtheria with kerosene oil and salt, used thus: Every patient was given a lump of rock salt about the size of a boy's marble, and instructed to keep it in his or her mouth, allowing the salty saliva. At the same time the throat was rubbed with kerosene oil, and a flannel saturated with kerosene kept around the neck until the symptoms were abated or entirely gone. If necessary, mild cathartics were given. Not a case was lost, and there were fully 150 in all on the plantation."

## TABLE OF CONTENTS.

GENERAL EDITORIALS.—Roasting Ores for Leaching Process; Lead; A Metallurgical Center, 129. The Week; Desulphurizing Ores; Hydraulic Mining in Canada; Academy of Sciences, 136. Legislative; Trouble in Eureka District; Fungi Injurious to Grain, 137. Notices of Recent Patents, 140.

ILLUSTRATIONS.—Improved Roasting Furnace with Double Fire Places, 129. Tilletia Caries, 137. MECHANICAL PROGRESS.—Malleable Cast Iron; Changes in the Earth's Orbit; Radiant Matter; Improved Construction of Buildings; Steel; An Electric Hammer; To Harden Steel; New Friction Pulley; Protecting Iron from Oxidation, 131.

SCIENTIFIC PROGRESS.—Stones Clinging to Under Side of Ice; Influence of Dust and Smoke on Fog and Rain; Singular Discovery in Connection with Phosphorescence; Effect of Oil on Evaporation; Prof. Bell's Musical Disk; Separation of Cobalt and Nickel; A New Coloring Matter, 131.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 132.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Idaho, Montana, Colorado and New Mexico, 132-33.

USEFUL INFORMATION.—Black Stain for White Wood; Burnt Clay for Railroad Ballasting; Bleaching Straw; Metallic Bells; New World Products and Their Effects; Liquid Fuel; A New Style of Card for Woolen Mills; Process of Imparting a Metallic Glaze to Filaments, 135.

GOOD HEALTH.—When to Eat; New Treatment for Varicose Veins; Neuralgia as a "Warning"; Restoring the Dead; Kerosene and Salt for Diphtheria, 135.

MISCELLANEOUS.—Montana Mines; Silver Hill District, Arizona; Railroad Fares in California; Silver Reef Items, 130. Physical Studies of Lake Tahoe; Miners' Wages and Low Grade Ores; The Original Prospector, 134. The Flouring Industry of the Pacific Coast, 135. A Chloride Lamp; Copper Ore, 138. NEWS IN BRIEF on page 140 and other pages.

## Business Announcements.

Tanite Company—Stroudsburg, Monroe County, Pa. Seeds and Plants—Peter Henderson & Co., N. Y. Delinquent Notice—Blue Bird Mill and Mining Co.

## The Week.

The week has been one of sunshine and pleasant weather, and, as we write, it looks as if this would continue for some time. Spring will soon be upon us, and mining operations will then be proceeded with vigorously. Attention still continues to be drawn to the Territories south and east of us, and many miners are going in that direction. It is to be feared that many of them will be disappointed, as there are more miners in many of the camps than can find employment.

The miners' wages question still agitates several of our communities. In Virginia City it is a topic of the greatest interest, and is being thoroughly discussed. The *Enterprise* says it is a thing becoming more daily apparent, that the property-holders, business men and mass of the people of the Comstock earnestly desire to see the miners and managers of mines to get together and make some arrangement by which the idle in our midst may have an opportunity of supporting themselves and families. There is no earthly reason why this business may not be talked over as calmly and quietly by sensible men as any other matter affecting the welfare of this community. On both sides that should be done, and those concessions made, which seem best for the whole mass of miners and business and working people.

The difficulty between the Albion and Richmond companies, at Eureka, has attracted considerable attention from mining men, and when the companies took such steps as seemed liable to endanger the lives of the workmen, the Miners' Union stepped in and insisted that such proceedings should stop. As the matter now stands, committees from the Union are into the mines to see that neither company infringes the other's rights, until the affair can be settled by the courts.

THERE are 7,000 men at work on one section of railroad from the city of Mexico to Yoluca, and the section will be inaugurated in May. The Central railroad employed 110,308 laborers the last week in January.

## Desulphurizing Ores.

Probably there is no more important metallurgical improvement needed than a cheap, practical and satisfactory method of eliminating sulphur, arsenic, antimony, etc., from the ores of precious metals. Given such a process, and thousands upon thousands of tons of ore would be worked here and elsewhere every year, which are at present utterly valueless. To attain this object inventors are continually striving, and scarcely a month passes that we do not hear of some process for desulphurizing ores which is to do the work, sure.

Among the recent candidates for favor in this direction is a process having some peculiar features. The ore is ground up and mixed with crude petrolum or other hydro-carbons, this mass being then subjected to heat and flame in any suitable contrivance which will hold this material in position, and allow a sufficient supply of air to feed combustion of the hydro-carbon and of the gases generated by such combustion. That is, the heat and flame which is used is that which springs from the material itself and the air which feeds the combustion.

The mingling of the hydro-carbons with the ore in a finely divided state may be done by reducing the hydro-carbons to powder, or by employing them in a liquid form, all thoroughly mixed.

The inventor of the process finds a convenient mode of using it to be, to put the fine ore, intimately mingled with fluid asphaltum, upon some wood shavings or paper, in a furnace having a flame chamber, with a bottom having numerous small openings for air currents, and under this a chamber adapted to hold air under pressure, to be forced into the chamber above. Fire being communicated to the shavings or paper, and fine currents of air under pressure being admitted to the flame chamber, the hydro-carbons, mingled with the fine ore, speedily takes fire, in turn setting fire to the sulphur, which is immediately released, and to the gases generated by the act of combustion. The whole mass is expected to burn up with a brisk flame, and the operation of eliminating the sulphur be accomplished in a few moments. The material left after such treatment is in a light, porous condition, something like pumice stone, and is readily crushed and fit for amalgamation.

With fluid asphaltum, one part, by weight, is mixed with nine parts of ore. The process is said to be effective with concentrates, fine dust, high or low-grade sulphurets, ores containing arsenic, tellurium, antimony, etc.

The peculiarity of this process does not consist in mixing the ore with hydro-carbons, for that has been done before; that is, the ore has been mixed with hydro-carbons and smelted. But it consists: "First, in reducing the ore to fine particles; second, in intimately mingling the ore with hydro-carbons; third, in subjecting such particles while under exposure to air drafts, to heat and flame produced entirely by the combustion of the hydro-carbons and the inflammable gases generated in combustion." If supplemental fires are used, it would be another thing. In this, it is hoped to do without all fuel except the hydro-carbons mixed with the ore. The process may be practicable, but the ore is not under control as to management of heat, as in a roasting furnace. With highly sulphureted ore, there would have to be a large quantity of hydro-carbon used to thoroughly desulphurize it.

POCKET MINING.—Pocket mining around Sonora, Tuolumne county, is in the height of excitement. The *Independent* says that around Bald mountain a great deal of fresh ground has been broken, and old locations are being vigorously worked. It says: Three Mexican boys, one formerly a boot-black in Sonora, finding there was nothing in it during the rainy season, left the business to try his luck at mining. They prospected near Nat Arnold's claim in Clark's gulch, above Yankee hill. They found some very rich float rock, but a stream of water on the ground, and after eluding and a short run they cleaned up between \$300 and \$500 in quartz gold, and succeeded in uncovering a fine and promising quartz vein which prospects well. Prepare to hear of another rich strike.

PROPOSED TUNNEL.—We see by the *Placer Herald* that a move is on foot, headed by Wm. Roberts, to run a tunnel north and south through Duncan hill. Such a tunnel would cut through all the many ledges in that hill at the depth of several hundred feet from the surface, and afford cheap and convenient means for working them; and the *Herald* sees no reason why it would not prove a paying enterprise. With such a tunnel and a mill at the mouth of it, there would be lively times in that locality.

STAY AT HOME.—The *Georgetown Gazette* (El Dorado county), which, by the way, is one of our most readable exchanges, paying strict attention as it does to local topics, in speaking of miners leaving here for the new mining districts of the Tombstone, says: "After being well healed, most of them will find their way back to old California, and content themselves in prospecting in this the most encouraging field we know of."

## Hydraulic Mining in Canada.

It seems that they are about to get to work mining for gravel in Canada, and doing it on the hydraulic mining principles. An association has been formed in London to purchase some ground on the Riviere du Loup, in the county of Beauce, Province of Quebec, Canada. The property consists of 1,245 acres, held in fee simple, and of mining rights over about 1,927 acres in addition thereto. Both sides of the Riviere du Loup are included in the property to the extent of two and one-half miles on one bank, and three miles on the opposite bank.

The formation is of conglomerates and talcose slate and sandstone, with numerous small veins of quartz. There are also several large bedded veins of quartz from which samples have been taken, showing fine gold visible in the rocks. An analysis of a sample of this rock gives a result equal to \$300 to the ton. There are enormous deposits of auriferous gravel high up on the banks of the river, and it is proposed to commence operations by washing this gravel by the hydraulic method. Mr. W. J. Smart, M. E., who is spoken of as a "gentleman of great experience in gold mining in California," has made a report on the property, in which he says: "The result of our prospecting on the bed rock in the bed of this river was from 5 cents to \$1.50 to the pan of 25 lbs. of gravel, which should pay very largely if economically and advantageously worked. The banks of the river also prospected well. The main lead being exposed at two different points, one at the upper eastern boundary, and the other at a distance of about three-quarters of a mile below on the same side of the river, with indications of its crossing to the opposite bank of the river at a point below on the property."

"The depth of gravel in this lead will range from 30 to 50 ft., the exact depth being impossible to positively determine without drifting on the bed rock to its lowest point; our prospecting of this lead yielded from 1 to 20 cents to the pan of 25 lbs. of gravel, which would pay you well to sluice largely to hydraulic, which I would recommend as the best way to work it. There is abundant water in the river for all purposes, and sufficient for all to work by either method. The natural advantages are very favorable. You have good timber in abundance in the immediate vicinity, a railroad within 20 miles of the property. The price of a good class of labor at this point is from 80 cents to \$1. per day."

"There are two small streams running into the Du Loup river on the property that I understand from the people here have yielded well, but I did not prospect them to any extent."

Two seasons have been devoted to the exploration and opening up of these deposits, and Mr. A. A. Humphrey, who has conducted this work, estimates that there are 30,000,000 cubic yards of gravel in sight, carrying gold at the rate of 30 cents per cubic yard, equal to \$9,000,000. The cost of washing this gravel will be two and one-half cents per yard, equal to \$750,000—leaving a net profit of \$8,250,000, or \$1.650,000, from this part of the property alone.

In the report on this property by Mr. W. J. Smart, M. E. (Morey, Smart & Co.), a gentleman of great experience in gold mining in California, it is stated they have got 5,000 inches of water, and the prospectus says: "A head of 150 ft. can be obtained for one-twentieth the cost for the same amount of power in California."

It seems the association is to pay \$80,000 in fully paid up shares, and \$15,000 in cash for the property. It is intended to start work at once on the gravel, and afterwards on the quartz. We shall watch this hydraulic mining experiment in Canada with interest, but think they could have got good ground a great deal cheaper out here by buying at first hands.

WASHED THROUGH A FLUME.—Some two weeks ago, during the heavy rain storm and high water, a man by the name of Taylor, who was at work in Col. Moody's claim, at Gold Run, was washed through one of the double flumes under the following circumstances: Mr. Taylor in attempting to place a board across the flume slipped and fell into the water. This flume is double and the sides some 8 ft. high, and was at that time more than half full of water, which was running at a rapid rate. Taylor managed to float himself on the surface of the water and washed through the flume, some 300 ft. long, and over the dump at the end, 8 ft. high. The quantity of water was so great he could not stop himself here but was washed down the canyon about 500 ft. further before the water spread out sufficiently as to stop its force so he could manage to get out. Strange as it may seem Taylor escaped injury with the exception of several bad bruises on different parts of his body.

OLD TAILING PILES.—Last week Mr. Neelon brought into Oroville, Butte Co., a slug which weighed \$67.50. He picked it up on a pile of tailings near Hancock City. The tailings, from which the piece was taken, were the refuse thrown out from mines that had been worked in '49. A large number of men are at present at work washing over all the old tailing piles near that place.

CALIFORNIA DISTRICT, Arizona, has three "companies" operating there, and it has from 800 to 1,000 locations, which are being prepared for sale to the Eastern sharps who are expected with the spring.

## Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening, Vice-President Bebr presiding.

Donations to Museum: From W. A. Lawson, a human skull, supposed to be that of a Washoe Indian found at Reno, Nev.; from Julius G. Grundell, a horse shoe crab; from N. N. Lockington, a specimen *Urolophus torpedinus* (sting-ray); from Mrs. A. E. Bush, of San Jose, specimens of serpentine, talc and marmolites, from Santa Clara county; from Mrs. E. V. Robinson, of Santa Barbara, box of carnelians, agate, etc., from Crescent City, Del Norte county; from Julius G. Grundell, fragment of a geode; from Henry Chapman, specimen of infusorial earth from Hamburg, Germany, used here in making giant powder.

Professor E. T. Cox and L. Oesterrischer were elected resident members of the Academy.

## Alaska.

Among the exchanges and donations to the library, received since the last meeting, was a preliminary report upon the population, industry and resources of Alaska, by Ivan Petroff, special agent of the United States Census of 1880, transmitted to Congress January 13, 1881, by Secretary Schurz. He speaks of Alaska as a Territory without a civil organization, where cereal crops cannot be grown, and treats of its spruce forests, fur trade and fisheries, or other natural resources; also of the Ingalix, or people of the great interior, or large extent of country situated away from the coast.

The Russian Church claims as on its registers 10,950 Greek Christians, from among a total population divided as follows: Whites, 392; Creoles, 1,683; Aleuts, 2,214; Innuits, 17,488; Indians, 8,401; making a total of 30,178 souls as the entire population of Alaska, enumerated for the recent census.

The past year there were caught 100,000 seals, 5,700 sea-otters, 10,000 martens, 8,000 foxes, 1,000 bears, 4,000 beavers, and 20,000 mink. Also, from the neighborhood of Shumagin Islands, 600,000 codfish and 2,000 hls. salmon.

## Currents at Behrings Strait.

Among other documents received was an abstract of a report to C. P. Patterson, Superintendent U. S. Coast and Geodetic Survey, by W. H. Dall, Assistant in charge of the schooner *Yukon*, employed last summer on the coast of Alaska, with a diagram of Behring Strait and hydro-thermal sections, showing its surface, temperatures and depths. The general conclusions reached from these, with previous and subsequent observations in the strait, was as follows: The water is warmest toward the American side. The highest temperature is 48° F., and the lowest about 36° F. The uniform succession of the vertical curves, representing degrees of temperature, are generally very regular, but sometimes interfered with by an eddy around the diomed islands, rising abruptly as granite domes, with bold perpendicular sides, wholly without any beaches, in the middle of Behring Strait. The uniformity of the temperatures from top to bottom, does away with the idea of any sub-surface current from the Arctic Ocean, carrying cold water southward. His current observations showed another conclusion to be probable, although a more thorough investigation will be required to place it beyond question, namely, that the northerly current, through the straight and along the Arctic Ocean, is chiefly dependent on the tide for its force and direction and on the warming of the shallow waters of Norton Sound and the Yukon and vicinity for its high temperature, which is greater than any of the Behring sea water south of St. Lawrence island. This would agree with observations of explorers along the Siberian coast and elsewhere, where large bodies of comparatively warm water derived from large rivers are poured out over shallow areas of a cold sea-basin.

The direction of the current in Behring Strait, when the *Yukon* was lying near the Diomedes, was reversed by the tide, and the vessel tailed in opposite directions during flood and ebb. The rate varied with the strength of the tide, and during their stay did not exceed three knots. The directions agreed with the trend of the land on either side of Cape Prince of Wales, along which the tide runs, and where it would naturally gather its greatest velocity, and, as a consequence, diagonally cross the strait.

On the reading of these notes a discussion ensued concerning the probable position of the *Jeannette* and the influence of Arctic currents on her progress. This gradually led the discussion with the question of the change of climate in the Arctic, and the reason why the remains of tropically reared animals were found in those northern regions.

It was stated that a letter had been received by one of the members from Mrs. De Long, in which she expressed to the Academy her acknowledgements and thanks for their kind interest manifested toward her husband, both before his departure and, as shown at their recent proceedings, inquiring into the probable present position of the *Jeannette* and missing whalers. She said the opinion arrived at in the proceedings of this academy more nearly coincided with her own preconceived opinion than any she had yet seen. She feels confident that he wintered the first winter as far north as he was able to go, on the east coast of Wrangel Land.

Professor Davidson gave notice that at the next meeting he would read a paper prepared by Ivan Petroff, on the "Internal Water Communication in Alaska."

## Legislative.

The Legislature, though it has not many days more to exist, is doing its work slowly, and a great deal will be left undone that should have been attended to. The debris and appropriation bills are, of course, the most important to be considered.

Enos' bill, providing that all public work be done by day labor, was referred to the Committee on Labor and Capital. It was reported favorably by this committee, and was passed in the Assembly.

Senate bill, No. 36, relative to mining corporations, and which we have before given, was reported for rejection.

Assembly bill, No. 163, to transfer the cabinet of minerals in the State library, and all the instruments belonging to the Geological Survey at the University, not needed by the University, to the State Mineralogist, was finally passed.

Mr. Mason introduced a concurrent resolution asking for an appropriation of \$20,000 from the Federal Congress to remove obstructions to navigation at the mouth of Smith river, in Del Norte county.

Assembly bill, No. 431, by Whipple, gives \$5,000 to provide for a proper representation of the products of California at the next World's Exhibition, to be held in New York in 1883. The commissioners receive no pay.

Assembly concurrent resolution, No. 23, by Mr. Murphy, is as follows: Whereas, from various causes, natural and otherwise, the Sacramento river, the harbor of Vallejo, the bay of San Francisco, is becoming fast filled up and shoaled by debris and detritus, thus not only endangering the harbor of San Francisco, the navigation of the Sacramento, but also the Navy Yard at Mare Island; therefore, be it

Resolved by the Assembly, the Senate concurring, That our Senators in Congress be instructed, and our Representatives requested, to use all honorable means to secure an immediate appropriation of at least \$500,000, to be expended under the direction of engineers appointed by the President of the United States, to secure our rivers and harbors against this threatened danger.

Resolved, That the Governor be requested to immediately transmit a copy of these resolutions to each of our Senators and Representatives in Congress.

Mr. Chase has introduced a bill to permit the voters of every county, city, town or township, in this State, to vote on, and thereby to determine the question of granting license to sell intoxicating liquors within its limits.

Mr. Baker, of Sacramento, by consent, introduced a bill to amend Section 25 of an act to promote drainage. The bill provides that the money derived from the State tax shall be used only on cuts and outlets of rivers. Referred to Committee on Water Rights and Drainage.

The Committee on Labor and Capital have reported back Senate bill, No. 5, for the establishment and maintenance of a Bureau of Labor and Land Statistics, recommending that it do pass; A. B. 492, to establish a Bureau of Labor Statistics, without recommendation; S. B. 21, to regulate the hours of labor on work for the State, recommending that it do not pass.

Mr. Griffith moved a reconsideration of the vote by which A. B. 202, to establish a State Hospital and Asylum for Miners, was passed yesterday, and stated his objections to the passage of the bill, saying that it was vague and ambiguous in its character. Mr. Lewis liked the ideas in the bill, and hoped it would not be reconsidered. Mr. Hoitt moved to lay the motion to reconsider on the table. Carried.

Mr. Yung introduced a bill to prevent the filling of the streams, rivers and bays in California with the tailings and debris from hydraulic mines. The bill provides that every person, as well as every person who in behalf of any other person, or as the agent or employee of any person or corporation, who runs or deposits, or who procures or suffers to be run or deposited into the bed or channel of any river in this State, or any branch thereof, any of the tailings or debris from any mine in this State, worked by what is known as the hydraulic process, is hereby declared guilty of a felony, and upon conviction shall be confined in the State prison for a period of time not exceeding ten years; provided nothing in this act shall be construed to prohibit the owners of such mines from acquiring gulches and flats, or either thereof, adjacent to any of such rivers or streams, or at any other convenient or suitable places, and therein depositing such tailings and debris; provided, further, that by means of dams, or other obstructions, they confine such tailings and debris therein, and do not suffer or allow the same, or any part thereof, to run, to be carried into or eventually flow into any such river channels or their

branches, or into any bay or harbor of this State; and provided, further, that every person or corporation injured in any manner by the flow of any such tailings or debris from any such mines, may maintain an action jointly or severally, for all such damages sustained by any or all of them, and when the question is one of common or general interest of many persons, or when the parties are numerous and it is impracticable to bring them all before the court, one or more may sue or defend for the benefit of all. And in such action all persons or corporations, or either thereof, contributing to such damage complained of, may be joined as defendants, and all such persons or corporations who shall suffer or allow any such tailings or debris to escape into any such river channels or the tributaries thereof shall be deemed to have contributed to such damage complained of, and upon a recovery being had, the plaintiff shall be entitled to a judgment for triple damages.

The bill was read for information of the House, and after debate was finally referred to the Committee of Irrigation.

Senator Wm. Johnston, of Sacramento, has introduced a bill authorizing the Board of State Capitol Commissioners to set aside not less than 400 ft. squares of land in the State Capitol grounds, east of the State Capitol building, for the erection of a Sutter Memorial and Industrial Exhibition building in honor of the late Gen. John A. Sutter. The California Pioneers and Territorial Pioneers of California, and the State Board of Agriculture, are authorized to erect the said building on the land set aside. The

## Trouble in Eureka District.

There has been for some time a dispute between the Albion and the Richmond mining companies, at Eureka, Nevada, about the boundaries of the respective claims, but more particularly about a certain ore body. For the past two weeks the companies have been annoying each other in many ways, using cayenne pepper, smoking each other out, etc. A dispatch sent from Eureka on the 20th, says: A fire was discovered in the south chamber, No. 13, of the Richmond mine on Thursday, which was only extinguished after considerable trouble. Attempts were made to create this impression that the fire was incendiary, and was occasioned because of the difficulties with the Albion. While the question was being discussed yesterday came the report of the Albion's narrow escape from entire destruction and the news of the injury to several miners by an explosion. Excitement and indignation are rife, but among the many reports circulated the following are alleged to be the facts: For the past week the Albion people, to protect their ground, have resorted to the smoking-out process—the draft being through the Richmond, both mines being connected by drifts. The Richmond people not being able to endure the smoke drifted under the Albion ground. At 2 a. m. Saturday there were fired off four boxes of giant powder of 50 lbs. each, and two kegs of black powder

## Fungi Injurious to Grain.

One of the most interesting studies for the microscope is found in the life history of the fungi injurious to growing grain. There are several of these known under the different names, "rust," "mildew" and "smut." There are also several kinds of smut, one appearing upon what are styled the grasses as distinguished from the cereal grains, another infesting the ears of Indian corn. And there is still another, the smut of wheat, *Tilletia caries*, the full life history of which is illustrated in Figs. 1 and 2. The two engravings cover parts of the same ground, but each has points which lead to their use in this connection. The appearance of a smutty head of wheat may be seen at Fig. 3. The center of attack is the floral organ of the plant, and aside from the repelling characteristics of this fungus itself, it produces a sorry and disheveled appearance of the wheat head. The spores of the smut fungus are sown with the grain. This fact is shown by the good results which attend soaking the seed grain in a solution of bluestone. This substance is fatal to the life of fungus spores, and by its use seed grain is measurably freed from the parasite. Such spores as escape with their lives, or are introduced to the wheat field from outside sources, gain access to the plant, and proceed to multiply rapidly. After attaining a growth inside the young grain, and giving it a swollen and distorted appearance, they burst through the epidermis, and send forth myriads of black dust or spores, which cover the grain head, and attach themselves to everything which touches it. The grain of wheat from a smut-stricken head appears at a natural size. The cutting open of the grain shows the interior to be fully possessed by the fungus; *b* in Fig. 1, and *b* in Fig. 2 show the section of a smutty kernel; the latter so much magnified that some traces of the fungoid growth are shown. The black dust, if highly magnified, is seen to be composed of globular bodies with a covering marked off into hexagonal divisions. This appearance is still plainer at *d*, where the true diameter is magnified 1,000 times. The smut fungus has an obscure mycelium; that is, its thread-like parts, which, somewhat compared to the roots of higher plants, are not so abundant as in other fungi, as for example, in the "rust" fungus shown above. This mycelium is not furnished with suckers as are mycelia of some other fungi. For these reasons, perhaps, the smut fungus does not spread through the plant, but is apparently satisfied to remain in the head, as though it knew it had the best part of the structure, and there it devoted its energy to the production of the dust, or spore masses.

In this reproduction of its kind, the smut is also peculiar. The spores spring directly from the mycelium, with no intervention of sexual organs as are detected in other order of fungi. The steps in the reproduction are shown in the engravings. In describing these steps, we shall draw mainly upon the writings of M. C. Cooke and of Prof. Farlow, the well-known mycologist, of the Bussey Institute. After a short period of rest, the spore throws out a germinal tube (Fig. 3, *d*). This is short, and is crowned at the top by a whorl of cells, which unite with one another in pairs by a cross-partition, thus forming a sort of conjugation (Fig. 3, *f*). After this lateral union has taken place, certain of the cells begin to elongate, as shown in the engraving, above the point of contact. The reproduction is continued. The elongations, or sporules, as they are called, are shown in still larger form at Fig. 2, *g*. These forms are also known as secondary spores. Soon they give out a third form, the club-shaped body shown in Fig. 2, *h*, which is called a tertiary spore. The tertiary spores have another generation of their own kind, shown at Fig. 2. Thus the foe of the wheat grower, known as smut, proceeds in its evil way.

New Mexico.—Very rich silver specimens are brought from the Florida and Black Range mountains, and the Los Vegas Mining World says, the general impression prevails among old miners that the Chihuahua of New Mexico will be found in these new districts, which have been held by the Apache Indians until recently. The small bands of hostiles that still exist in the southern part of the Territory will soon be exterminated and the entire Territory will be open to progress.

True.—The best paper a miner can subscribe for is the MINING AND SCIENTIFIC PRESS. It will keep you posted in the mining news of the Pacific States and Territories. It will enlighten you upon the improvements in machinery and working of ores.—*Georgetown Gazette*.

The members of the Union, desirous of protecting their own lives, held a meeting and discussed the situation. It was finally decided to adopt the suggestion of one of the contending parties and put men enough in each mine to prevent either company from encroaching on the other, until the difficulty is settled by the courts.

The British Columbia authorities offer a bonus for a woolen mill to be erected in that province.

FIG. 1—TILLETIA CARIES.

building may be occupied jointly by the State Board of Agriculture, for the State exhibitions of the industries and industrial products of the State, and by the California and Territorial Pioneers, for the safe keeping and preservation of relics of the early history of California. The form and plan of said building shall be submitted to and approved by the State Board of Capitol Commissioners, and when erected shall be deemed the property of the State.

TANITE.—The Tanite company of Stroudsburg, Monroe Co., Pennsylvania, have carried on the manufacture of their peculiar product to such perfection that emery wheels and emery grinding machinery is now found in use all over the country. It is so much in demand that in addition to the usual agencies they keep large stocks at various central points, as will be seen by card in another column. There are five classes of wheels, each adapted for a special purpose. In addition to the wheels they manufacture various grinding tools or machines for various purposes, specially adapted to the class of work they are to do. Among others is their saw gummer, which is in extensive use. They make special sizes of wheels with round, flat or beveled faces. Newman's emery planer, which this company make, has taken a cut one-sixteenth of an inch over a surface of 100 square inches in six minutes and nine seconds. They have a car-box grinder, shaper and sharpener, table grinder and surfacing machine, emery grinders of various sizes, etc., etc. The company now does a very large business in manufacturing its special class of goods, which have an enviable reputation at home and abroad.

ANTIMONY is quoted in Liverpool at £62 to £64 per ton for French star regulus.

FIG. 2—THE SAME STILL MORE ENLARGED.

## A Chloride Camp.

## Taylor District.

Taylor district, situated about 12 miles in an easterly direction from Ward, has been attracting no little attention within the past few months. The ores shipped from it by the new locators of late have invariably given good returns. That the district has not attracted attention before is what puzzles not a few. Having heard so much about Taylor district lately, we accepted an invitation from George C. Hamilton and visited the district Sunday last. After examining the Monitor, owned by McGill, Briggs & Lyons, the Sunrise, owned by Carothers & Garaghan, and the Self-Cocker, owned by the last named parties, it was not difficult to arrive at the conclusion that Taylor had been overlooked by the first locators. The mineral belt is fully three miles long by a mile wide. In the Monitor there is more ore in sight of a grade that will pay to mill than can be found anywhere in the State so near the surface. Much of the ore is high grade, in proof of which we have but to cite the fact that several years ago between 8 and 10 tons of ore were shipped to San Francisco, and, after paying all expenses, a profit of \$2,200 was left. The owners are at present engaged in running an open cut lower down on the east side of the ravine, a short distance from a cut that has penetrated the ore about 15 ft. The old cut is entirely in ore, all of which will pay to mill, and a portion will go as high as \$400. Mr. Lyons, one of the owners, who showed us all there was to see, is free to admit that he was never interested in a better prospect than they have in the Monitor.

We next visited the Sunrise, which is being opened in two places—in one place by tribute work and in the middle of the claim by men in the employ of the owners. In both openings the prospects are not only good, but very good. In the opening in the middle of the claim, where the work is being done by the owners, a number of sacks of ore that will pay to ship were on the dump. From our standpoint it appeared that they had only commenced getting into the ore, which is rich beyond question. This particular spot is claimed by the knowing ones to be the richest along the mineral belt. On the same claim, a short distance from the southern end, James Hixon and Charles Peck are doing tribute work. If they were playing the end against the middle, they might lose, but we don't think they will. After going through a limestone cap of eight or nine ft., they have cut a body of ore that promises to widen out. They have fully as good prospects as any in the district.

We next visited the Self-Cocker mine, also owned by Carothers & Garaghan. James McComie and John Murphy are doing tribute work on this claim, and have out about eight tons of first-class ore that will go from \$500 to \$600, and about 30 tons of second-class ore that will go from \$100 to \$150. Some of the first-class ore goes as high as \$2,000. They are making no effort to develop the mine further than following the ore and taking out all that is in sight. Wherever they find the cap rock cropping out, which is a mixture of quartzite and lime, they are sure to find ore by cutting through it. Many an old prospector can learn something about prospecting by visiting the district. His first remark would be: "I have walked over just such looking stuff as that for the last 20 years." Taylor promises to be the best chloride camp in the State if nothing else. —Ward Relex.

**COPPER ORES.**—The furnace at the Ludwig copper mine, Mason valley, will be ready to start up in a day or two. There are 3,000 tons of ore already extracted and on the dump awaiting reduction. The furnace will be capable of reducing 30 tons of ore per 24 hours. The company have sunk a well and have any amount of water. The work of fitting up the furnace and superintending affairs generally is being done by Chris. James, of Gold Hill. —Gold Hill News.

## Business Directory.

## MOREY &amp; SPERRY,

MANUFACTURERS OF

## Gold and Silver Grinding and Amalgamating Machinery

**HOWLAND'S PULVERIZER** Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one per hour of hard quartz that will pass through a 40-mesh screen. The wear is less in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supply Iron Work complete for Wood Frames, also

**SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

**MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.**

9 Geary Street, Junction of  
Market and Kearny, S. F.

## California Inventors

Should consult DEWEY & CO., AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as patent attorneys enables them to offer Pacific Coast inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS AND PACIFIC RURAL PRESS, No. 202 Sanson St., San Francisco.

## THE IMPROVED INGERSOLL

## Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

**GEO. R. FOARD, GEN'L AGENT,**  
No. 18, First St., S. F.

## CAUTION.

To the Public Generally.  
Notice is hereby given that George R. Foard, of No. 18 First Street, San Francisco, is the sole authorized agent for the sale of our manufactures, consisting of Rock Drills, Air Compressors, and duplicate parts of either in the territory known as the Pacific Slope, and that no other person or persons have any right or authority to represent themselves as the agents of this Company within the above mentioned territory.

Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.

INGERSOLL ROCK DRILL CO.

New York, November 30, 1880.

Scientific and Practical Books  
on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, uplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00, cloth, postage free.

## LEACHING

## Gold and Silver Ores,

By C. H. AARON.

The most complete Hand-book on the subject extant, 164 pages octavo.  
Illustrated by 12 Lithographic Engravings and Four Woodcuts.

Fully indexed. Plainly written for practical men. In cloth, \$3.00. Sold by

**A. J. LEARY, Stationer,**  
402 & 404 Sansome Street, San Francisco.  
Send for Circular.

**Books for Miners and Millmen.**

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequalled by any other published embracing the subjects treated. Post-paid, \$7.50. Printed and sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated. 114 pages. 1878. A useful and practical work, free from technicalities and extremely serviceable for miners use. Post-paid, \$2. Published and sold by Dewey & Co., S. F.

OPP'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, \$1.00. Sold by Dewey & Co., S. F.

A New Edition.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 166 pages. 1880. A valuable and carefully written work. Postpaid, \$3.00. Sold by Dewey & Co., S. F.

**M. B. DODGE,**

**First Premium.**

**STONE BREAKER AND ORE CRUSHER.**

The Dodge Rock Breaker CHALLENGES THE WORLD to produce as good and cheap a machine. Rock Breaker and Cornish Rolls Combined in one Machine. Pulverizers to granulate Ores for Roasting, chloriding, leaching & concentrating.

M. B. DODGE, 481 Fremont Street, S. F.

**PACIFIC POWER CO.**

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.]

- FOR WEEK ENDING FEBRUARY 1ST, 1881.
- 227,171.—TAP AND FAUCET.—E. H. Crow, S. F.
- 227,093.—FRUIT DRIER.—Charles Dickinson, Portland, Oregon.
- 227,179.—PLOW.—C. Gratten, Stockton, Cal.
- 227,238.—GRINDING MILL.—Geo. Johnson, Sacramento, Cal.
- FOR WEEK ENDING FEBRUARY 8TH, 1880.
- 227,358.—BOX.—G. P. Adams and J. Miller, S. F.
- 9,556.—LAMP.—reissue.—E. Boesch, S. F.
- 227,324.—SEPARATING FIBER.—E. A. Leigh, S. F.
- 227,665.—HORSE-HOLDING ATTACHMENT.—R. E. Shannon, S. F.
- 337,645.—STOCK INDICATOR.—J. C. Uhler, S. F.
- NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

**HORSE-HOLDING ATTACHMENT FOR VEHICLES.** Roht E. Shannon, S. F. This invention particularly appertains to that class of horse-checking devices operated by gear wheels attached to the hub of the vehicle. The usual running gear of a vehicle is employed. Under this body and running its length between the axles is a shaft terminating in its rear end in a bevel-pinion which meshes with another bevel-pinion on a rod. The rod is fastened in appropriate braces, which permit of its turning to the rear axle. Its outer end is provided with a bevel-pinion which meshes with cogs on the inner side of the hub of the wheel. When the vehicle stops the lines are thrown into a slot in the top of the upright standard. The stirrup is pressed forward, which action pushes the rear hoxing sufficiently to throw the bevel-pinion and cogs upon the wheel in gear. If the horse moves forward, the rod turns, which turns the shaft, pushing the feathers or ratchets in the shaft into operation with a loosely running gear wheel, thereby winding up the line and checking the horse.

**SIDE-HILL HEADER WAGON.**—W. Taynton & W. J. Derickson, Clayton, Cal. This header wagon consists in certain connections and attachments by which they are adapted for use on side-hills, and are so arranged by means of peculiarly constructed gearing under the head of the wagon, and operating on curved holsters, that the head of the wagon may always be kept on a level without reference to the angle which the wheels may take on side-hills, the center of gravity being always kept in such a position as to prevent danger of overturning, even with top-heavy loads.

**WINDMILL.**—E. Foskett, San Jose, Cal. This windmill consists in the employment of a vertically oscillating beam, which is balanced upon the upper end of a vertical rotating post or standard, and is provided at one end with a rudder which holds it in line with the wind, while the other end supports a frame containing a series of vanes. In combination with this apparatus is a novel device by which the vanes have their angle changed at the end of each stroke, so as to produce a return stroke, and a regulating device by which the angle of the vanes may be adjusted to suit the strength of the wind.

**DRAW BAR FOR CARS.**—A. H. Weir, Los Angeles, Cal. This invention relates to certain improvements in railroad-car draw-heads and couplers, and it consists in a novel construction of the fastenings whereby the draw-head is secured to the car. To fasten this draw-head to the cars the stem is provided with a key on each side, beveled so that a wrought-iron clasp driven over them will hold them tight to the stem, and a small bolt runs transversely through the stem and keeps the hand in place.

**GRINDING PAN.**—Steiger & Kerr, S. F. This invention relates to certain improvements in the reduction of ores, and in the apparatus employed for that purpose; and it consists in the combination with what is known as the "Miller," or "Hepburn" pan, of a screen or screens, which are fitted into the side of the pan and provided with controlling gates, so that the pan may be operated continuously, as may be desired.

**GUN FOR KILLING VERMIN.**—J. S. Woolsey, Gilroy, Cal. The tube or barrel of this gun is provided with a leg whereby the gun is set upright in the ground at the mouth of the squirrel hole. When the gun is placed at the entrance of a hole, the animal, in coming toward it, will cause the gun to be discharged by touching a rod which is connected with the trigger.

The Sierra Madre Villa.

The accompanying engraving, although made from recent photographs, but meagerly represents the natural view of probably the most celebrated "winter home" in southern California. It is no doubt justly entitled to the good reputation given to it as the most desirable villa residence known by many of its European and Eastern visitors—some of whom have wandered around the world in search of the most pleasant and recuperative climate.

At times the guests are so numerous at the villa that at present the proprietor, Mr. W. P. Rhoades, is troubled to find room for all who are urgent for accommodations. On the register here are to be found prominent representatives from the leading cities of the Union and many foreign countries.

It is situated on the "mesa" (table land) adjoining the Sierra Madre mountains, 13 miles from Los Angeles and 10 from the railroad station near the old Mission at San Gabriel. This mesa is in the warm or thermal belt, at an altitude of 1,800 ft. Havana tobacco plants are still growing here untouched by frost, and tomatoes are continually ripening for the table in the open air. The honey bee, true to its instinct, "improves each shining hour," even in mid-winter, by gathering a part of its living from the bloom of trees, shrubs and occasional wild flowers.

Surrounding the villa and along its pleasant walk are a variety of ornamental plants and trees. Its large orange, lemon and lime orchard annually produces the finest and earliest fruit in Los Angeles county. A large apiary, a vineyard and an orchard of common fruits and nuts belong to the homestead.

The principal rooms of the villa are of good size, lighted by gas and well arranged for the comfort of guests. The wide piazza extends along the whole front of the parlor, music and billiard room and the main building villa. Being enclosed with a glass front it furnishes a good promenade, with a magnificent view extending over San Gabriel valley, Pasadena and gradually sloping plains (extending some 30 miles or more to the ocean beach at Santa Monica), Wilmington harbor and beyond to Catalina island, distant in this act, a return to that effect shall be made upon the invoice, and articles so noted shall not be permitted to pass the custom-house or be delivered to the consignees, unless on re-examination, as provided for in this act, it shall be found that the said articles are not adulterated.

SEC. 4. The owner or consignee shall have the privileges of calling, at his own expense, for a re-examination, and on depositing with this collector of customs such sum as he may deem sufficient to defray such expenses, it shall be the duty of this collector of customs to procure a certificate, under oath from a public analyst, of a careful analysis of the articles in question; and in case the report by certificates of the analyst shall declare the report of the officer who examined the goods to be erroneous, and the said articles to be unadulterated, the said articles shall be returned to the owner or consignee, and passed without reservation on payment of the duties, if any. But in case the officer's return shall be sustained by the analyst, the said articles shall remain in charge of the collector of customs, to be disposed of in accordance with regulations to be prepared by the National Board of Health and approved by the Secretary of the Treasury: *Provided*, That the owner or consignee, on payment of charges of storage and other expenses necessarily incurred by the United States, and on giving bond, with sureties satisfactory to this collector, agreeing to remove said articles from the United States, shall have the privilege of re-exporting them at any time within the period of six months after this date of the report of the inspector or public analyst.

SEC. 5. In order to carry into effect the provisions of this act, the Secretary of the Treasury is hereby authorized to appoint from names submitted to him for that purpose by the National Board of Health one or more suitably qualified persons as special inspectors and as public an-

A WINTERING PLACE IN SOUTHERN CALIFORNIA.

all between 50 and 60 miles. All this and many intervening hills and distant mountain ranges are to be viewed in varying lights, shades and grandeur.

The place was purchased by Mr. W. Cogswell, the artist, of San Francisco, and laid out and planted by him with the choicest of trees and shrubs at a total expense of about \$75,000, for a private villa, six years ago. To Eastern visitors the growth of the place appears almost miraculous for so short a period. A fountain and large stone reservoir, supplied with pure mountain water, is a rare benefit and attraction to the place.

A beautiful drive is had from Los Angeles city through East Los Angeles, between the rolling hills, along the Arroyo Seco to Pasadena, through the thriving town and colony settlement and over the sloping table land to the hotel. Many pleasure parties visit the villa in this way enjoy a good view of the country and return the same day by way of the Old San Gabriel Mission and Alhambra settlement. No tourist does southern California or himself justice without visiting the Sierra Madre villa.

**Adulteration of Food or Drugs.**

In the last issue of the PRESS, in an article on the above subject, we proposed to give in full the bill on this subject presented to Congress by the National Board of Trade. The bill is as follows:

*Be it enacted*, That no person or corporation shall knowingly transport, or cause to be transported, from the State, district, or Territory in which he resides or does business, into any other State or Territory, or from any foreign country, or other State or Territory, into the State or Territory in which he resides or does business, for sale or barter, or to be offered for sale or barter, any article of food or drugs adulterated within the meaning of this act, and any person violating the above provision shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be fined not more than \$50 for each offense.

SEC. 2. That no person shall, within the District of Columbia or any of the Territories, or in any fort, arsenal, dock-yard, or reservation, or other place under the jurisdiction of the United States, manufacture, offer for sale, or sell any article of food or drugs which is adulterated within the meaning of this act, and any person violating this provision, shall be deemed guilty of a misdemeanor, and, upon conviction thereof, shall be punished by a fine not exceeding \$50.

SEC. 3. If, on examination of any food or drugs imported from any foreign country, it is found to be adulterated within the meaning of

alysts for adulterated food and drugs at such ports of entry as the Secretary of the Treasury may deem expedient, and it shall be the duty of the National Board of Health to prepare instructions governing the work of such inspectors and analysts, which, when approved by the Secretary of the Treasury, shall govern their action, and that of collectors of customs, in preventing importation from foreign countries of food or drugs adulterated within the meaning of this act.

SEC. 6. The National Board of Health shall make, or cause to be made, examination of specimens of food and drugs collected under its direction in various parts of the country, and shall publish in its weekly bulletin the results of such analyses. If it shall appear from such examination that any of the provisions of this act have been violated, the Secretary of the Board shall at once report the facts to the proper United States District Attorney, with a copy of the results of the analyses duly authenticated by the analyst under oath.

SEC. 7. It shall be the duty of every district attorney to whom the Secretary of the National Board of Health, or any collector of customs, shall report any violation of this act, to cause proper proceedings to be commenced and prosecuted without delay for the fines and penalties in such case provided, unless, upon inquiry and examination, he shall decide that such proceedings cannot probably be sustained, in which case he shall report the facts to the National Board of Health. And for the expenses incurred and services rendered in all such cases, the District Attorney shall receive and be paid from the Treasury such sum as the Secretary of the Treasury shall deem just and reasonable, upon the certificate of the judge before whom such cases are tried or disposed.

SEC. 8. An article shall be deemed to be adulterated within the meaning of this act—

A.—IN THE CASE OF DRUGS.

1. If, when sold under or by a name recognized in the United States Pharmacopoeia, it differs from the standard of strength, quality or purity laid down therein.

2. If when sold under or by a name not recognized in the United States Pharmacopoeia, but which is found in some other pharmacopoeia or standard work on Materia Medica, it differs materially from the standard of strength, quality or purity laid down in such work.

3. If its strength or purity fall below the professed standard under which it is sold.

B.—IN THE CASE OF FOOD OR DRINK.

1. If any substance or substance has or have

been mixed with it so as to reduce or lower or injuriously affect its quality or strength.

2. If any inferior or cheaper substances or substances have been substituted wholly or in part for the article.

3. If any valuable constituent of the articles has been wholly or in part abstracted.

4. If it be an imitation of or be sold under the name of another article.

5. If it consist wholly or in part of a diseased or decomposed, or putrid or rotten, animal or vegetable substance, whether manufactured or not, or in the case of milk, if it is the produce of a diseased animal.

6. If it be colored or coated, or polished or powdered, whereby damage is concealed, or it is made to appear better than it really is, or of greater value.

7. If it contains any added poisonous ingredient, or any ingredient which may render such article injurious to the health of a person consuming it: *Provided*, That the National Board of Health may, with the approval of the Secretary or the Treasury, from time to time declare certain articles or preparations to be exempt from the provisions of this act: *And provided further*, That the provisions of this act shall not apply to mixtures or compounds recognized as ordinary articles of food, provided that the same are not injurious to health and that the articles are distinctly labelled as a mixture, stating the components of the mixture.

SEC. 9. It shall be the duty of the National Board of Health to prepare and publish from time to time, lists of the articles, mixtures or compounds declared to be exempt from the provisions of this act in accordance with the preceding section. The National Board of Health shall also from time to time fix the limits of variability permissible in any article or compound.

SEC. 10. The term "food" as used in this act shall include every article used for food or drink by man.

The term "drug" as used in this act shall include all medicines for internal or external use.

SEC. 11. All the regulations and declarations of the National Board of Health, made under this act from time to time and promulgated, shall be printed in the Statutes-at-Large.

SEC. 12. This act shall take effect ninety days after it shall have become a law.

News in Brief.

FOUR HUNDRED molders are on a strike at Cincinnati.

THE fire in the coal mine at Nanaimo, B. C., is entirely extinguished.

FRENCH subjects are being murdered in Algeria by marauding tribes.

EMIGRANT rates from Hamburg to New York have been reduced to \$20.

THE Czar is distributing money in the famine-stricken districts of Russia.

THE Western Union Telegraph Co. has increased its capital stock to \$80,000,000.

AT Havre, France, a large quantity of cartridges intended for export have been seized.

THERE are double the number of married men employed on the Comstock than single ones.

FIFTEEN collieries in South Yorkshire, England, and 12,000 men are idle. Great distress exists.

THREE THOUSAND white men will be wanted in British Columbia the coming season for railroad work.

FOR the nine months ending January 31st, the dairy products of the country amounted to \$21,000,000.

WHEELER, who strangled his sister-in-law at San Francisco, was sentenced to be hanged on April 19th.

THE period of suspension of Capt. Bradley, of the ferry boat, *Bay City*, which collided with the *Oakland* recently, is 60 days.

THE total cost of shipping, transporting and erecting the obelisk presented by the Khedive to the city of New York was \$103,732.

THE Oakland Guards have found it impossible to raise the necessary funds to carry them to Washington, and the subscriptions will be returned.

SIX THOUSAND colliers in Wiguna district, England, have resumed work. Many resumed work in Hinley district. The military and police protect the workers.

T. P. EARNEST, a heavy live stock dealer of Colorado, says that nearly twenty per cent of the cattle of the State perished during the severe weather of the present winter.

IT is now learned that the Peruvian capital was captured by the Chileans through the treachery of Peruvian officers, who encouraged the soldiers to pillage and murder.

IN the Greek Chamber of Deputies Saturday, royal decrees were submitted calling to arms all the men above 21 years of age who have served three months or more in the army.

A TELEGRAM has reached this city that Lyman Hall, first assistant engineer of the steamer *Alec Duncan*, was drowned at Moro bay on Sunday. No particulars have been received.

AT Santa Ana, a party of engineers are reported to be making surveys at the coal fields recently purchased by the Southern Pacific Railroad company, preparatory to sinking shafts.

A DISPATCH from Chihuahua (Mexico) says the Indians are again on the war-path. A band of 200 attacked a settlement near Carrillos recently, killing several women and children and plundering the place.

The Californian.

THE RISING MONTHLY OF THE DAY. YEARLY SUBSCRIPTION \$4. Single number 35 cents. AGENTS WANTED in every town and village of the United States to canvass for this popular magazine. The most liberal commissions will be paid to responsible parties. This is a chance to make money at your own home. Address THE CALIFORNIA PUBLISHING CO. (P. O. Box 2310) 202 Sansome St. S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), he sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Various Causes—

Advancing years, care, sickness, disappointment, and hereditary predisposition—all operate to turn the hair gray, and either of them incline it to shed prematurely. Ayer's Hair Vigor will restore faded or gray, light or red hair to a rich brown or deep black, as may be desired. It softens and cleanses the scalp, giving it a healthy action. It removes and cures dandruff and humors. By its use falling hair is checked, and a new growth will be produced in all cases where the follicles are not destroyed or the glands decayed. Its effects are beautifully shown on brashy, weak, or sickly hair, on which a few applications will produce the gloss and freshness of youth. Harmless and sure in its operation, it is incomparable as a dressing, and is especially valued for the soft luster and richness of tone it imparts. It contains neither oil nor dye, and will not soil or color white cambric; yet it lasts long on the hair, and keeps it fresh and vigorous.

FOR SALE BY ALL DEALERS.

A SCIENTIFIC OPTICIAN.—In 1863, C. Muller commenced the sale of glasses of all kinds in this city, and has continued in the business ever since. Mr. Muller has made the study of the human eye the study of his lifetime. He has, for years, read and experimented, until to-day he stands at the head of all opticians in this country, and his fame extends not only over this coast, but over the far East, and throughout the world. He has studied the eye in all its varying phases, until it is no longer necessary to consult a physician, who, perhaps, has but given this important organ of the human body but a cursory examination, for Mr. Muller has made it the business of his life to study its peculiarities and idiosyncrasies, and he is by nature and by thought thoroughly prepared to almost give sight to the blind. His establishment at No. 138 Montgomery street, is a curiosity in itself, for his stock is large and worthy an examination, and the passer-by on Montgomery street who sees Lord Dundreary staring from the window will be sure to stop at C. Muller's, the leading optician of the coast.—S. F. Journal of Commerce.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

WORTHY OF SUPPORT.—The Scientific Press, Dewey & Co., publishers, 202 Sansome street, San Francisco, is the leading representative journal of the mining interests of the Pacific Coast, and should be encouraged by all who desire to promote home industry. The terms are \$4 a year, within reach of all. Send in your names for the new year.—Mountain Messenger, Sierra county.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and either binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

How to STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company,

Nevada Block, room No. 37, San Francisco, February 15th, 1881.—At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 64) of Fifty (50) Cents per share was declared, payable on Monday, February Twenty-first (21), 1881. Transfer Books closed until the Twenty-second (22d) instant. P. JACOBUS, Secretary pro tem.

ANNUAL MEETING.

The regular Annual Meeting of the Stockholders of the Peytona Gold and Silver Mining Company will be held at the office of the Company, No. 310 Pine Street, Room 15, San Francisco, California, on Monday, the Twenty-eighth (28) day of February, 1881, at the hour of 12 M., for the purpose of electing a Board of Directors to serve for the ensuing year, and for the transaction of such other business as may be presented. Transfer books will close on Friday, February Twenty-fifth (25), 1881, at the hour of 12 M.

J. W. PEW, Sec'y.

Office—310 Pine Street, Room 15, San Francisco, Cal.

Booth Gold Mining Company.—Location of principal place of business, San Francisco. Location of works, Auburn, Placer County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second (2) day of February, 1881, an assessment, No. Three (3), of Three (3) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room No. 44, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Seventh day of March, 1881, will be delinquent, and, in default of payment, the same, unless payment is made before, will be sold on the Twenty-eighth (28) day of March, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors. GEO. R. SPINNEY, Sec'y.

Office—Room No. 44, No. 310 Pine Street, San Francisco, Cal.

Blue Bird Mill and Mining Company.—

Location of principal place of business, San Francisco. Location of works, Globe District, Pinal County, Arizona.

Notice.—There are delinquent, upon the following described stock, one account of assessment, No. one (1), levied on the eighth (8) day of January, 1881, the several amounts set opposite the names of the respective shareholders, as follows:

Plastic Cement and Hair Felt, with or without the Patent "AIR SPACE" Method. Cement ready for use by the barrel.

G. C. FOWLER, No. 413 Pacific St., S. F.

'49 AND '50.

MR. JOHN VANCE CHENEY'S new historical story of early days upon this Coast will be commenced in the next number of "The Californian."

A NEW SERIAL STORY will be commenced in the next number of THE CALIFORNIAN which will run during the remainder of the year. It is entitled "'49 and '50," and is a story of early days upon this coast. The author is Mr. John Vance Cheney, whose articles in the leading Eastern magazines and in THE CALIFORNIAN have received such wide and merited recognition. Mr. Cheney has had this story in preparation for THE CALIFORNIAN for some time. Competent critics, to whom it has been submitted, pronounce it at once realistic and fascinating. The stirring events of 1849 and the succeeding year are vividly pictured. Absolute truthfulness of impression is sought rather than idealization. A thread of romance runs through the work, and the interest is sustained to the end.—(Note Book).

NOW IS THE TIME TO SUBSCRIBE.

"This magazine is only in its second year, but the merit shown renders it worthy of patronage from all parts of the country."—[Liberal Press, Woodbury, N. J.]

"An exceptionally bright periodical."—[New Haven Palladium.]

"A welcome visitor comes to us each month from the far off Pacific Coast. It is THE CALIFORNIAN, whose literary worth compares well with Eastern contemporaries. The January number is brimful of good things."—[Louisville Post.]

"There is a long list of attractive contents. It is an excellent number of a very good magazine."—[Philadelphia Inquirer.]

DEWEY & CO.'S

Scientific Press

Patent Agency.

(ESTABLISHED 1860.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Wash- ington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

## HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

**No. 1 XX is the Strongest Explosive Known.**

**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE.

VOLUME XLII  
Number 10.

## Concentrating Tailings.

An ore concentrating pan or box has lately been devised, which answers as an amalgamator as well, and which is so constructed as to impart to the tailings or pulp, a very peculiar shaking motion, by means of which the precious metals are settled to the amalgamating plate at the bottom of the pan or box. This is provided with riffles and set on an incline. It has a fixed pivot at one corner or at one side of the central longitudinal line, and diagonally opposite to said pivot are stops or lugs, between which revolves an alternately disked cam wheel, whereby a lateral rolling, as well as a vertical motion, is imparted to the pan. The pan is hung by means of chains at the corners, and the plate on the bottom is amalgamated.

The pulp or tailings, mixed with water, pass into the box, the whole being thoroughly mixed up by the peculiar motion. By the diagonal motion of the pan the sand and water are given a partially side, partially backward shake, which spreads it evenly over the pan, causing a thorough intermingling of the sand and water, and a settling of the gold to the bottom, where it is caught by the riffles and plates. As the pivot is a fixed one, there can be no longitudinal or endwise motion of the pan, which would tend to discharge its contents; but as the motion is an oscillating or swirling one, there is a backward and upward motion given to the sand, which ensures settling. At the end of each stroke the vertical shake imparted by the cams serves to prevent the gathering of the sands on the surface of the plates, and to loosen it to allow the gold and mercury to settle. In conjunction with the diagonal shake, the vertical motion serves to impart a semi-rolling motion to the sand, turning it over and over, giving the heavy particles an opportunity to settle to the bottom.

If this appliance is used in lieu of other apparatus at the end of the plates of a mill, a series of two or more pans may be used, connected by sluices.

## Tanite Emery Grinder.

The accompanying engraving represents the Tanite emery grinder which is one of the several varieties of grinding tools manufactured by the well-known Tanite company, Stroudsburg, Pa. The tool shown is a No. 2 run wheels from eight to twelve inches in diameter. The machine is intended to be set on a lathe or work bench. It has a steel arm one-sixteenth inch diameter in the bearings and turned at the ends to one inch. The flanges are four inches in diameter. It has cone pulleys to give two rates of speed. Each machine is provided with two face and two side or surface rests.

The regular or specified speeds for wheels to run on the No. 2 grinder, calculated at 5,500 feet per minute, for a point on the periphery of the wheel. Eight-inch wheel, 2,700 revolutions per minute; nine-inch, 2,400 revolutions; ten-inch, 2,160 revolutions; and twelve-inch, 1,800 revolutions. This machine is well suited to general machine work, and one of them can be seen at H. P. Gregory & Co.'s 2 and 4 California street, agents for the Tanite company. This grinder is run with a 2½-inch belt and can be run from above or below with equal facility.

The Wood river fever rages high in Salt Lake City at present. There are 400 miners and prospectors in that city awaiting the arrival of spring, and every last one of them bound for the new El Dorado. The rush will be something immense as soon as the snow begins to disappear.

## Extraction of Gold from Sulphurets.

The extraction of gold without quicksilver is limited principally to that class of ores in which the gold is not free; that is, not in metallic condition, but combined with sulphur, arsenic or tellurium. Ores containing free gold, finely divided, the gangue of which is quartz without admixture of sulphurets, can be treated by chlorine gas directly without roasting, in the same way black sand may be treated, but sulphurets,

too wet, but only moist enough to allow its being sifted. On the bottom of the bucket, *a*, shown in the engraving, some clean rock or broken glass is placed about two inches deep, and covered with a piece of moistened canvas. A short glass pipe, *c*, a quarter of an inch in diameter, is inserted close above the bottom.

The ore, *d*, is then introduced, filling up two-thirds or less of the space as loosely as possible, and covered with a wooden or iron cover and pasted all around with dough. The cover is provided with a short glass tube, like *c*, to which an india rubber tube, *f*, for carrying the

atic acid. Through the pipe, *o*, it enters the bucket and ascends slowly till it reaches the cover, escaping then through the rubber pipe, *f*, where it must be examined from time to time by dipping a glass rod into ammonia and holding it to the end of the pipe, *x*, which leads out of the room. In contact with chlorine the ammonia evolves white fumes, and chlorine can be detected by these means wherever it may escape. The gas is allowed to pass through the bucket as long as chlorine is created. In this condition, by stopping up the pipe, *x*, if no more chlorine is evolved, the apparatus may stand until the next day. The cover is then removed, the pipe, *o*, taken off, a clean glass or porcelain vessel, as indicated by *z*, placed below *c*, and cold water carefully poured over the ore till the bucket appears to be full. The solution which comes out at *c*, must be examined at times in a small tumbler with a few drops of a solution of sulphate of iron. If the clear solution remains unchanged, without becoming darker, the lixiviation is finished.

To the solution in the vessel, *z*, a few drops of muriatic acid, and then sulphate of iron, or green vitriol (dissolved), is added and stirred with a glass rod. The whole is allowed to stand till all the gold is precipitated and the liquid is perfectly clear. This is drawn off by means of a syphon, for which the rubber pipe, *z*, can be used. The remaining fluid and the precipitated gold are gathered on a filter, washed with warm water and dried with the filter in a porcelain cup, above an alcohol lamp. The filter is burned either free or under a muffle, care being taken not to lose a particle of the filter ashes; mixed with some lead it is then cupelled and the gold button weighed. A comparison with the assay shows to what percentage the chlorination has proceeded.

FOUNDRY NOTES.—The opening of spring will revive the foundry business of this city, which is rather dull at present. The Ris-

donworks are employing some 400 men, however, having in addition to general work a good deal of marine machinery on hand. They have furnished all the hydraulic pumping machinery to the Comstock. The Pacific has lately shipped some furnaces to Arizona, and the Fulton is engaged on considerable mining machinery. The Union works keep a number of men at work all the time, but none of the foundries expect any great activity for a month yet.

THE Mayor of Oakland in his message states the total valuation of municipal property [at \$1,061,595, or \$250,000 more than the city's indebtedness; taxable property within the city limits, \$28,691,610; taxes levied, \$341,443.94, out of which only the sum of \$577.05 is delinquent. He favors reform in the educational system, and disapproves the teaching of higher branches in the public schools. The tax levy has been fixed at \$1.05 on the \$100.

PRIVATE advices from Harshaw, Arizona, say there is a great excitement, caused by the striking of a chimney of ore on the Harshaw mines. The cropping are 15 ft. high and 19 ft. wide.

THE advance in the price of lead is caused by its scarcity in the Eastern markets, and the prospects are quite favorable for still higher prices.

A CORRESPONDENT writing from Candelaria says many buildings are being torn down and moved to Gold Mountain. Candelaria is very dull.

YIP YAP, is the name of a new town opposite Croy's creek, Wood river, Idaho.

IN the Sutro tunnel the flow of water in standard gallons per 24 hours is 3,320,000.

THE TANITE COMPANY'S EMERY GRINDER, NO. 2.

arsenurets or tellurides have to be subjected to a thorough roasting. Silver ores, rich in gold, can be also advantageously treated with chlorine gas after a chloridizing roasting, provided that no coarse gold occurs in the ore. Ores or sulphurets containing coarse gold are not suitable

for chlorination. Both glass tubes, *c* and *f*, must be likewise secured with dough.

The chlorine gas is generated in a glass vessel, *A*. There are two corks in it, each having a glass tube, as represented in the drawing.

APPARATUS FOR TESTING ORES BY CHLORINATION.

ble for chlorination. By this process, if properly executed, 90 to 95% of the fire assay can be extracted.

In order to be sure of a result on a large scale, it is an easy matter to make an experiment with 20 or 30 lbs. of sulphurets or of ore in the following way which is described in the Roasting of Gold and Silver Ores, by G. Kustel: (for sale by Dewey & Co., price \$3.) The named quantity must be roasted first, and it is the most difficult task, requiring either a small furnace or a great deal of patience, especially when small charges are treated on a large piece of sheet iron, having a charcoal fire beneath. In either case the sulphur must be driven out perfectly, so that when in a glowing condition, no smell of sulphurous acid can be observed. When finished, a sample is taken for an assay, and the roasted stuff moistened with water, after the weight of the whole has been noted.

A common water bucket is then prepared to receive the moistened ore, which must not be

too wet, but only moist enough to allow its being sifted. The cork, *l*, is removed and the vessel charged with three ounces of peroxide of manganese, four ounces of common salt, and 4½ ounces of water, all well mixed. The cork is inserted again and well secured with dough. Another vessel, *B*, provided with two necks, contains water, as indicated by *g*; the glass tube, *h*, dips about one-half an inch into the water. The corks are made air-tight like the others in *A*. The whole apparatus is now joined together by rubber pipe, *n* and *o*, fitting tightly to the glass tubes. Having all thus prepared, 7½ ounces of sulphuric acid are poured through the safety-tube, *m*, but only in small portions and at intervals. When the bubbling of the water at *g*, in the vessel, *B*, is not lively enough, some more acid is introduced, and finally the temperature raised by an alcohol lamp. If all the joints have been luted carefully with dough, not the slightest inconvenience will be met with. The chlorine gas from the generator, *A*, is forced through the water in *B*, by this means washed from muri-

## Notes on the Marine Fishes of the Pacific Coast.

[Read before the California Academy of Sciences by W. N. LOCKINGTON.]

A recent issue of the proceedings of the U. S. National Museum contains a full list of the marine fishes of the Pacific coast, U. S. A., including in all 270 species.

There have been only three additions since the date of my last paper upon this subject. These are *Crystalllogobius eos*, discovered and described by Miss Rosa Smith, of San Diego; *Myctophum procellarum*, a rare deep-sea fish found in the northern part of our coast by Dr. Bean, of the Smithsonian Institute, and described by him, and *Prionotus stephanophrys*, Lockington. *Scomberesox brevirostris*, Peters, has, on one occasion at least, occurred in our markets, to which it was sent from Monterey; and *Salmo clarki*, Richardson, *S. mykiss*, Walbaum (the salmon trout), *Oncorhynchus keta* and *O. kisutch* (the dog-salmon) are recorded from San Francisco bay. Thus, out of a total of 16 salmonids known to occur in our streams and on our coasts, 10 are found in our bay, including four salmon (*Oncorhynchus*), three of trout and three of smelts.

The rigid enforcement of the rules of priority adopted in England and America have changed many names which were fast becoming familiar; thus, the salmon known as *tsupitch* is now *keta*, because the latter name was the one first used, in print, to designate the species; that known as *canis* is *kisutch*, and *Salvelinus bairdi*, the Dolly Varden trout, after having been proved identical with *S. spectabilis*, Grd., must now be known as *S. malma*. Many other similar changes have been made, the enumeration of which would weary all present, but it may be admissible to remark that the well-known generic name of *Engraulis*, long applied to our anchovies, must give way to *Stolephorus*; that *Cybius concolor*, the Spanish mackerel, our *bon-vivants*, so highly prized, is now *Scomberomorus concolor*; and that the gar-fish found south of Point Concepcion must no longer be called *Belone exilis*, but *Tylosurus exilis*.

I regret that an attempt I made to enbalm an esteemed member of this academy in ichthyological nomenclature has proved futile. My bag-fish, *Bdelostoma stouti*, now rejoices in the name of *Polistotrema dombeyi*, Muller. No allusion to Dickens.

### Gasterosteidae.

The fishes of this family are commonly known as sticklebacks, on account of the isolated sharp spines which represent the first or spinous dorsal of other fishes. The family name is derived from the bony shields upon the abdomen, formed partly by the bones of the thoracic belt or shoulder-girdle, partly of the pelvic bones, which appear externally. There are no true scales, but the sides of the body are in some cases plated, or partially plated.

The sticklebacks seldom exceed two inches in length, and are thus too small to be of economic value, at least to the white races. They occur in both fresh and salt water, mostly in shallows, marshy pools, and small brooks and ponds.

Seven species are enumerated by Dr. Gerard (U. S. P. R. Rep. X.) as inhabiting the waters of the Pacific coast, but on further examination these have dwindled to three, viz: *G. serratus*, *G. microcephalus* and *Eucalia Williamsoni*. *G. serratus* is probably identical with *G. aculeatus*, a widely-spread species, occurring in the Eastern States and in Europe. The variety found in California, and formerly considered to form several species, differs from the typical *aculeatus* in the slightly greater comparative depth of the body.

*G. microcephalus* may be known by the small head, deeper body, and shorter anal and soft dorsal fins. It occurs at the mouths of streams and similar situations, and has been taken in salt water at Monterey by Prof. Jordan.

*E. Williamsoni* will, Prof. Jordan tells me, probably be identical with *Eucalia inconstans*, a species found in Ohio, Minnesota and Kansas, and noticeable both for its pugnacity and for its nest-building habits.

### Syngnathidae.

The *Syngnathidae* or "pipe-fishes," which form the principal family of the order *Lophobranchii*, are tolerably well represented in Californian waters, since four species are on record. The fishes of this family are exceedingly elongated, and covered with a continuous series of more or less bony rings of plates, movable upon each other. The bones of the jaws are united together into a long tube, at the tip of which the small mouth is situated. There are no ventral fins, and the movements of the body are principally executed by means of the dorsal and pectorals. The most curious characteristic of these fishes is the assumption by the male of the duties which in other creatures devolve upon the female. Beneath the body of the male is an elongated pouch, in which the eggs are ranged after they are laid by the female. In this receptacle the eggs remain till they are hatched, and the young until able to take care of themselves.

The pipe-fishes usually occur in salt, but occasionally in fresh water. On one occasion I was shown a specimen which found its way through the water pipes to the faucet of a sink. The largest specimens taken in the Bay of

San Francisco are about 18 inches long, but as fishes of this length do not exceed three-quarters of an inch in thickness in the center of the body, they are of no value as food fishes, especially as they do not occur in large quantities.

Small specimens are frequently brought to market, mingled accidentally with anchovies and other small fishes. The species in the Bay of San Francisco is *S. griseo-lineatus*, Ayres, which is believed by Prof. Jordan to be identical with *S. californiensis*, Storer, notwithstanding certain variations in the number of fin-rays and the length of the snout. South of San Francisco the variety described as *californiensis* is most common, and short-nosed examples were found at Soquel, where this form is very abundant. Three other species come in south of Point Concepcion.

### Ophidiion Taylori (Sand Eel).

This species, the only one of its family upon this coast, is an excellent food fish, but does not appear to be sufficiently abundant to be of much value, although it occurs along the entire length of the State of California. The largest I have yet seen was about a foot in length. In the *Ophidiidae* there are no ventral fins in the position usual among the related families, but their place is taken by two long bifid filaments attached to the central portion of the hoid bone.

Some fishes of a neighboring group, the *Brutulidae*, have filaments in lieu of ventrals, but these filaments are attached to the shoulder girdle or thoracic arch, the position usual among the *Anacanthini*. The sand-eel, although rather eel-like in its proportions, is deep immediately behind the head, thence tapering gradually to the tail. The vertical fins are continuous, low, even and many rayed; the head is rather large, and the mouth bears teeth upon the jaws (in a band) and also on the vomer and palatines.

The general color is olivaceous brown, becoming lighter below, and the sides are decorated with several rows of darker spots, one or two of the uppermost of which are continued to the caudal peduncle, while the others fade out more or less posteriorly.

The structure of the swim-bladder is curious. The anterior portion is narrower than the posterior, and has thicker walls, while two saucer-shaped ossicles are attached to its anterior extremity.

### Zoarceidae.

The *Lycodidae* or *Zoarceidae* are known to be represented by at least two species upon this coast. Examples of both species were described by the writer (Proc. 21, S. Nat. Mus., 1880, 326) under the name of *Leurynnis paucidens*. In the last sheet of the manuscript, which was unfortunately omitted in printing, dimensions were given, and the existence of a large-mouthed and a small-mouthed form was mentioned, but was passed over as possibly only an individual or sexual difference. Large numbers of the small-mouthed form have been obtained by the U. S. Fish Commission, and it is evident that they are distinct.

The name *Lycodopsis*, given by the Norwegian naturalist, Collett, was published before *Leurynnis*, and must, therefore, replace it. Blennidae.

The Blennoid fishes form a rather heterogeneous group, some of them closely approaching the *Anacanthini*, while others somewhat resemble the *Trachinidae*. All are comparatively elongate and compressed in form, and in some the elongation is carried to as great an extent as in the eels, and causes them to be popularly called eels, notwithstanding the differences of structure.

In the true eels (*Anguillidae*, *Muraenidae*) the sides of the jaw are formed by the maxillary bones, which bear teeth; the bones forming the shoulder girdle are not attached to the skull; the vent is placed at a greater distance from the head; and ventral fins are always absent. The *Blennidae* share none of these characteristics except, in some cases, the absence of the ventrals.

Seventeen specimens of this family are known to inhabit the coast of California. Most of them are too small to be of much use as food, especially as it is not their habit to go in shoals like smelt and anchovies, but to hide among rocks, or in similar situations separately. Three or four attain considerable dimensions, and are sometimes brought to market. The long, tapering form of the Wolf eel (*Anarrhichthys ocellatus*) and the stout and shorter olive-green *Cebidichthys violaceus*, with its crested head, must be familiar to the frequenters of our markets. *Apodichthys flavidus*, which attains a length of about a foot, and is occasionally sold in the markets, may be known by the large spoon-shaped spine at the origin of the anal fin, and is mentioned here only to introduce a kindred species, *A. fucorum*, which was first discovered by Prof. Jordan among the rock pools at Monterey, and which may readily be distinguished by the different form of the anal spine. In *A. fucorum* this spine is smaller than in *A. flavidus*, and is conical and convex on its anterior face. Some *Blennoids* of this coast have a peculiarity which is repeated in a different family (*Chiridae*), namely, the presence of more than one lateral line, or line of pores, along the flanks. The genus *Xiphister* has three such lateral lines, and is known to contain three species. *X. mucosus* is occasionally brought to market. Those I have seen there were from 15 to 18 inches in length. Like all "eels" they are high-priced fishes. Those in question were retailed at 30

cents per lb. This species may be distinguished from *X. rupestris* by its more oblique mouth, and by the more anterior origin of the dorsal fin.

*Heterostichus rostratus* is of a less elongated form, compressed, deep in front, tapering behind, with a conical head. It attains a length of about 18 inches, and now and then occurs in the San Francisco markets, but it is too rare to be of much importance as a food-fish. It may at once be known by the blotches of black, which form interrupted longitudinal bands along the body, the ground-color of which is yellowish brown. It is but rare among kelp south of Point Concepcion.

### Debris Misrepresentation.

The whole subject of hydraulic mining debris has been so thoroughly gone over of late that few fresh facts can be elicited. The anti-debris meeting held in Sacramento lately threw no new light whatever upon the subject. In the call for the meeting it was stated that evidence was in possession of the committee to prove that if hydraulic mining was stopped the rivers would be immediately restored to their normal condition. It was to be proved, too, that the late storms had washed out the debris from the canyons and that stoppage of the mining would solve the debris problem. None of these things were proved by any competent authority. Mere assertions of inexperienced and unscientific people amount to nothing. There are many who seriously charge the late floods to the debris, forgetting that similar floods occurred several times before hydraulic mining was attempted, and that districts were flooded which could not possibly be affected by debris.

But we did not start in to argue this question or refer to it at any length. We simply desire to protest against misrepresentation. There is no use in bringing forward as facts statements which, on examination, will prove to be untrue. Nor is there any use in getting angry on the subject and misrepresenting the whole matter. The question is difficult enough to settle plainly set forth. When obscured by incorrect and often maliciously false statements, it becomes more entangled than ever. One man said at the anti-debris meeting that the majority of the people of Nevada county had no interest in hydraulic mining, and that the people of Nevada and Placer counties not engaged in the business looked upon it with displeasure; that the mines were owned by foreign companies, etc. Concerning this the Nevada Transcript says:

"It is with a mass of just such untruthful testimony as the above that the miners have had to contend ever since the opposition to their interests began. Every statement embodied in the paragraph quoted is as false as false can be. Every citizen in Nevada county who possesses common intelligence trembles at the thought of the vast injury that will be wrought to all industrial and commercial pursuits carried on here should the large revenues annually derived from hydraulic mining be suddenly cut off. We do not believe there is a man living in this part of the State who does not share in this feeling. There is but one hydraulic mine in Nevada county owned by a foreign corporation, and the foreigners that own it have to send thousands of dollars here every year to pay for the improvements and developments constantly being made in connection with their property. With two or three exceptions, the hydraulic mines are all owned by residents of Nevada county. Those exceptional mines are owned in San Francisco. Every town in the county located above Nevada City (excepting Truckee and Boca) owes not only its prosperity, but its existence, to the successful continuance of hydraulic mining."

Men who know nothing at all about engineering tell us what the debris and water are doing with our rivers. Those who know nothing about the bay of San Francisco point out the injuries being done to it and the har. Competent engineers who have examined San Pablo bay pronounce the channel as deep as 20 years ago, though, however, Col. Mendell, U. S. Engineer, reports there is no danger of the har shoaling, yet we are told it is rapidly shoaling. In fact, there is a great deal of talk on this subject, which is only "talk." Half of the people who sagely discuss the subject know nothing at all about it. One man makes a loose statement and hundreds repeat it.

As to hydraulic mining, it is astonishing what ignorance is displayed concerning an industry so long maintained in California. A newspaper published in Oakland, only last week had a large engraving showing what purported to be a hydraulic mine, "where the debris comes from." A man was depicted standing close to a little bank, holding a nozzle in his hand, this being connected to a small hose. Near him were a few others breaking stones with pickaxes, and throwing back rocks with shovels. A wheelbarrow and pan stood near by. It gave no idea whatever of a hydraulic mine, and was most absurdly incorrect. Yet here it was published in California, in the second largest town in the State, and many people who will see the engraving will imagine they know what bydraulic mining is. This is one of the absurdities of the question, but is only one of them. There are many others too numerous to mention.

The bullion of Paradise mine, at Spring City, is said to be producing more ore than the company can dispose of.

### Trade Marks and Trade Names.

In the case of John W. Shaeffer vs. Francis Korbel et al., Judge Hayne, of the Superior Court, last week, rendered final judgment for costs in favor of the defendants and against the plaintiff. The case was commenced by Shaeffer, a cigar manufacturer, against Korbel Brothers, box manufacturers, to recover damages and also to obtain an injunction against the latter. Shaeffer claimed that Korbel Brothers had invaded his rights in their branding and using upon cigar boxes manufactured and sold by them, the following terms and phrases, which had been employed by Shaeffer as trade marks upon boxes and cigars made and sold by him, viz: "Chromo," "Oregon," "Grape," "Bon Ton," "Beauty," "Victoria," "Imperial," "Private Cuvee," "Red Seal," "Tony," "Fruit," "Green Seal," "Eclipse," "Slug," "Don Juan," "Columbus," "Star and Garter," "Give us a Light," and "Little Devil." It was decided that generic names or words in common use, descriptive of an article of trade, its quality, ingredients or characteristics, could not be adopted or appropriated as trade marks, and that Shaeffer, the plaintiff, had no right to the adoption of those terms or phrases as trade marks, and no claim to their exclusive or absolute use as such, and judgment was accordingly rendered against Shaeffer for costs of the action. John L. Boone appeared as attorney for the plaintiff, and Chas. Wittram for the defendant.

In the case of J. K. Prior vs. Alexander Badlam and Thomas Dunphy, Judge Hunt has filed the following decision in the Superior Court: This is an application for an order to restrain defendants from using, in connection with their business of bill posting, the name of "Key & Co." It appears from the affidavits herein, that the defendant, Dunphy, was, during the lifetime of A. C. Key, his agent and accountant. Key died in 1874, and his executors, one of whom was Dunphy, carried on the business of bill posting for the benefit of the estate. Subsequently Dunphy resigned as such executor, and thereupon formed copartnership with defendant, Badlam, to carry on said business on their own behalf. Accordingly, the defendant hired the place of business formerly occupied by the deceased, and advertised said business as follows: "Thos. Dunphy, late Manager of Key & Co."

It is alleged in the complaint that the words, "late manager of" are painted on said sign in letters so small, and the name, "Key & Co." in letters so large, as to deceive the public. If this were true, there is no doubt of the power of a court to restrain such a use, on the ground that the public may thereby be deceived; but here it is expressly denied in the answer and affidavits of defendants that such is the fact. In view of these denials, I consider it would be improper, in advance of trial, to practically adjudicate the case, by granting an injunction, which is the sole relief sought in and the sole object of this action. Applications denied.

THE EAST HAS NOW COMPLETED ITS MINING EDUCATION.—The East has graduated in mining in the school of experience. The people of that section of our beloved country say the price was high, but cheap as could be expected for such good schooling. The Boston Economist says: "We think it admits of no doubt that mining operators and professional promoters will, in the future, find it much less easy to advance their schemes in the Eastern market and among Eastern investors than they have in the past. The Eastern public has undergone during the last few years a severe and practical course of education, and though it is poorer by millions of dollars in money than it was before that course began, it is decidedly richer in experience which is likely to prove finally of incalculable value to it. It has learned that there are mines and mines; it has learned that 'bonanzas' are of such frequency that they have ceased to have the attraction which should be accorded to good, honest worth of medium promise; it has learned that the issuance of neatly engraved stock certificates representing a capitalization somewhere in the millions is not necessary evidence of the existence of a mine; and finally it has learned that mining, no more than any other business enterprise, is to be undertaken in a blindfold condition. These are things that it was absolutely necessary that the public should learn sooner or later, and we do not know that it could have been acquired at a lower price."

BULLION PRODUCT OF THE WORLD.—The Boston Economist says the production of gold in 1880 throughout the world amounted to \$118,000,000 (\$89,000,000 of which was produced in America); of silver, \$94,000,000 (of which \$76,000,000 was produced in America); total of both, \$212,000,000. The largest production in any one year was in 1853—of gold \$236,000,000; of silver, \$49,050,000; total of both, \$285,000,000. Since that year, the annual product of gold has diminished one-half, and that of silver has nearly doubled.

THE Black Diamond Coal Company, of Nortonville, are preparing to sink a shaft for pumping water from the mine at a point on the east side of the railroad and south of the hoisting works about one-fourth of a mile.

## MECHANICAL PROGRESS.

## Effect of a Galvanic Current Upon the Absolute Strength of Iron Ware.

Some experiments made by G. Hoffmann to determine this point have recently been made public, and will perhaps surprise many of our readers, some of whom will expect to find that electricity has no effect upon strength, while others will be disappointed to find this influence so slight. The wires employed were very small, ranging from one-fifth two-fifths of a millimeter in diameter. (One line is about equal to two millimeters.) A piece of each wire, one meter long, was clamped at both ends between steel plates, and thus suspended at one end while a scale pan hung from the other end, and in it were placed, at first, weights, then fine sand was poured in until the wire broke under the strain. The experiments were conducted between 68° and 77° Fahr., and mostly after the passage of a current, a few, however, during its passage. Feeble currents were employed, and those as constant as possible, and with every practicable precaution. The duration of the separate experiments was almost always the same.

In every case there was an increase of strength, and when the passage of the current lasted three hours the weight requisite to break the wire was increased from 12 to 92 grains.

With increased time there was an increase of strength up to a certain maximum, which was attained in some wires sooner than in others. Thus wires which gained in three hours 12 to 28 grms., gained in 12 hours 23 to 44 grms., and in 25 hours 24 to 50.

With feeble currents the increase of strength for equal time was nearly proportional of the strength of the current. If the current was somewhat stronger this law did not hold any longer, owing to its heating the wire. The strength seems to be greater while the current was passing than after it was broken.

Hoffmann thinks that while this increase of cohesive power was partially due to the heat generated by the current, the galvanic current itself played its own essential part therein.—*Indianapolis Journal*.

**A NEW ELECTRIC LIGHT BURNER.**—For over 20 years Mr. Holland, the gold pen manufacturer, of Cincinnati, has been experimenting with iridium, seeking some method by which it might be fused. Some time ago he discovered a flux which he mixed with the iridium dust, and successfully fused it in a common crucible in the ordinary draft furnace. He cast the metal in any shape desired, and in bars of ingots weighing as much as 10 ounces. The metal thus fused and cast defies the file and resists all acids. The only mechanical way of cutting it is by friction, with a copper wheel charged with diamond dust or fine corundum. Prof. Nelson Perry, of the Cincinnati University, regards this as one of the most wonderful discoveries in metallurgy he ever knew. As soon as his discovery was made, Mr. Holland saw that iridium would be valuable as a burner for electric lights. Iridium burners two inches long, and from one-eighth to one-sixth of an inch thick were tested, but the machinery used was found to be too powerful for an incandescent light, which is all that was aimed at with the iridium burner. The light produced, however, was very pleasant, and no glass globe was necessary as the atmosphere produced no effect on the metal. Experiments are now in progress with the Maxim machine, the electric current of which can be more easily regulated. A set of burners can be furnished for about \$4, and these burners will radiate a 10-candle light, upon present calculations, for an indefinite time. Mr. Holland has patented his discovery in this country, and also in Europe.

**TORSION.**—If we know the force in pounds per square inch that it takes to sheer any material, then that required to break a cylinder of it by torsion would be the leverage in inches, divided into half the shearing force in pounds per square inch, times 3,1416 times the cubic root of the cylinder area in inches. A square shaft is about one and one-fifth times as strong against torsion as a round one, and one-fifth less than a round hollow one of the same sectional area. Hollow shafts resist torsion better than solid ones of the same area of metal. Wrought iron shafting, supported at eight or nine ft. intervals by self-adjusting hangers, may have a diameter equal to the cube root of the number of horse-powers it transmits, divided by the revolutions per minute and multiplied by 125. The faster shafting revolves when transmitting a given number of horse-powers, the less the torsional strain.—*Indianapolis Mechanical Journal*.

**NEEDLE FOR BELT LACING.**—H. Royer, S. F. This invention relates to a novel device by which the rawhide thong or threads, or other material which is used to connect the ends of belts, is drawn and laced through the holes or eyelets prepared for its reception, causing the belts to be secured with greater facility than has hitherto been attained. It consists of a rigid tapered bar, having its larger end split so as to give sufficient elasticity at the split end. One or more sharp projections are firmly inserted in one of the sides, of such a length as to take firm hold of the cord or thong placed thereon, and having a slight inclination toward the point for the purpose of more firmly holding the cord or thong.

## Production of Malleable Nickel.

The brittleness of metallic nickel has always been an obstacle in the way of manipulating it. This quality has long been suspected to be due to the fact that the metal in the course of its preparation absorbed oxygen to a greater or less degree. Acting upon this theory, which is *a priori* reasonable, from the fact that it is known to have been verified in the case of copper and certain other metals, numerous efforts have been made to incorporate with it, during fusion, certain metallic or other substances, which should have the power of removing the oxygen while not impairing the good qualities of the product by its presence. With this object in view, the addition of small quantities of magnesium, and of manganese, to fused nickel, have been tried, and in the case of the first named, with considerable success.

Guided by the remarkable success that has attended the addition of phosphorus to copper alloys, as is shown in the production of phosphor bronzes having extraordinary tensile strength, M. Garnier, who is largely interested in the production of nickel, has made some experiments on the addition of phosphorus to this metal, with the view of improving its malleability, which, as we are informed, have given unexpectedly good results. From the accounts of these experiments which have come to hand, it is affirmed that if phosphorus to the amount of 1 in 3,000 be added to nickel, the metal becomes soft and very malleable; the addition of a larger quantity of phosphorus develops the hardness of the metal at the expense of its malleability.

The phosphorus is added to the metal in the form of a phosphide of nickel containing six per cent. of phosphorus, which in turn is made by fusing together a mixture of calcium phosphate, silicic acid, carbon and metallic nickel.

The assertion is further made that the nickel produced by treatment with phosphorus, is not only malleable of itself, but that its alloys with copper, zinc or iron are likewise soft and malleable.—*Manufacturer and Builder*.

## Another "New" Locomotive.

The Hinckley Locomotive Works of Boston are building a locomotive on a somewhat novel principle. It is the invention of Mr. Henry D. Shaw, and is described as follows in the *Boston Journal of Commerce*:

His peculiar idea in this matter is that of running the locomotive with two cylinders upon either side. One cylinder is attached to the crank upon one side of the center of the wheel, and the other cylinder to the opposite side of the same wheel, or opposite to the first connection. These cylinders are made one above the other, a connecting rod running from each cylinder directly to its crank-pin. The lower cylinder acts directly on the wheel or crank-pin in the wheel. The outside end of the crank-pin has a connection which passes to the center of the wheel, where it is taken hold of by an outside frame or a connection to the main frame of the locomotive, and affords it a hearing, while the extension of this piece makes up precisely the same kind of a connection with the locomotive driving wheel that the ship carpenter's auger affords him with the double end in it, the cranks being each side of the center. This attachment is to be made to both sides of the engine. A yoke separates and keeps the connecting rods in place should either one let go, so that no interference is to be feared from this.

The idea is to relieve the engine of the swaying caused by taking hold at the angles and changing the pressure with each revolution at each end of the stroke. Theoretically this is correct. A locomotive is being built which will be finished within the next two or three weeks, and is, we understand, to be put over the New York and New England or the Boston and Providence railroad for a thorough practical trial. Mr. Shaw is certainly deserving of success, and we hope will meet it, as there is little doubt about the matter mechanically.

**IRON RUST IN BOILERS.**—The oxidation of iron immersed in ordinary water, says *Engineering*, appears to be largely due to two causes, namely, first, the absorption of oxygen contained in the water, and second, the absorption of oxygen set free during the decomposition of the water, hydrogen being set free in the latter case. M. Lotin, who has made a number of experiments on the corrosion of iron wires immersed in water, and various solutions, and who has described his experiments in the *Comptes Rendus*, has arrived at the conclusion that the first of the above causes of oxidation is generally of the chief importance. With both distilled and ordinary water the temperature has a very important influence. Thus, at 68° Fahr. the quantities of oxygen absorbed per square foot of iron surface per hour when immersed in distilled and calcareous waters respectively, were 0.258 grains and 0.330 grains, while at 212° the quantities rose to about 2.364 and 2.579 grains. The immersion of iron in all the waters tested was accompanied by the evolution of hydrogen, the action being least, however, in distilled water. At a temperature of about 260° Fahr., the decomposition of the water was found to be equivalent to the absorption of 0.01 grains of oxygen per square foot of surface per hour for distilled water; 0.0129 grains for calcareous water; 0.0182 grains for water containing one-fifth part of crystallized chloride of magnesium; 0.05 grains for water saturated with chloride of sodium; and 0.067 grains for sea water.

## SCIENTIFIC PROGRESS.

## Photographs in Natural Colors.

The announcement is again made that a process has been discovered for taking photographs possessing all the brilliancy and delicacy of the natural colors, and an exhibition of pictures thus naturally colored has just been held in London. According to the reports, the colors are produced by the action of light alone in the camera, and owe nothing whatever to the artist's brush. In the photographs exhibited, the coloring appeared to be quite true to nature, and delicate tones and shades were clear to the view. The flesh tint was exact to life, and full justice was done to gorgeous regimentals. The protruded tongue of a dog in one of the photographs possessed the exact color of nature. Some of the guests, says the *English Mechanic*, inspecting this collection, and not fully acquainted with the character of the latest invention, took it for granted that the work was done by skillful, artistic hands on ivory and other material, and could scarcely believe their eyes when informed that the color, as much as the form and outline, was produced by the light of day. Careful investigation, however, would then show that human handicraft was not in it; for there were touches and effects which nature's pencil of light could alone accomplish. The contention is that photographs colored by artists, however clever, must be more or less "monotonous, hard, untrue to nature, and to the originals."

The process was discovered, it is said, by a French scientist, but has since undergone improvement by the proprietor of the process in England. If the new system proves an unqualified success, the reward will not have been reaped without much labor in the past, for numerous attempts have been made to induce the sun-pencil to fix colors in the picture it draws in the camera; but chemical and mechanical difficulties have stood in the way. In the new process colors are said not only to be faithfully produced, but protected from the action of light by being passed through a hailing solution, of which gelatine forms the principal ingredient, and that some of the photographs so treated have been exposed for months to the sun without being in anywise affected by the ordeal. Unfortunately, the process is yet unknown, as it is likely to be for some time to come.—*Manufacturer and Builder*.

**THE RANGE OF THE MASTODON.**—Prof. G. C. Brodhead contributes to the *Kansas City Review* an interesting paper, in which he enumerates all the discoveries that have been made of mastodon remains in the United States. This huge animal appears to have had a wide range in this country in past ages. The earliest record that we have of the finding of the bones of the mastodon is contained in a letter from Cotton or Increase Mather to the Royal Society of London, between 1650 and 1700, describing the portions of the skeleton of one of these animals discovered near Albany, N. Y. Since that period, skeletons nearly entire, detached bones, teeth, etc., of the mastodon, have been found in nearly every State in the Union, including those of the Pacific slope. The evidence thus far obtained goes to show that the mastodon first appeared in America in Miocene times, was abundant in the Pliocene, and lingered until the close of the Glacial period, and disappeared in the early Losses. We also find that he roamed at will from Canada to South America, being found as far north as 66° N. latitude on our Western Coast.

**A GREAT STORM.**—M. Rouger has communicated to the French Academy an account of a violent storm at Laigle, in September last. Between 9:30 and 11 P. M. there were at least 4,700 flashes of lightning; sometimes there were as many as three flashes per second. The rain began about 10:45 and lasted for about an hour and a half; there was no hail. The thunder was almost continuous, like a kind of buzzing, occasionally interrupted by heavy rollings. On one of the buildings that was struck there was a zinc conducting pipe, for carrying off rain water, which was pierced with three holes, two of which were square and the third round, as if made by a bullet. They all occurred where the walls of the pipe were doubled, and in each instance the hurt was inward in the inner pipe and outward in the outer pipe.—*Comptes Rendus*.

**FREEZING WATER UNDER PRESSURE.**—The only elaborate experiments ever undertaken in this direction were made by the French physicist, Boussingault, with the view of ascertaining the condition of water when cooled considerably below its normal freezing point, under circumstances where free expansion was prevented. For this purpose, a strong cylinder of steel was filled with water at its temperature of maximum density, and a steel plug fitted tightly to the opening, thus preventing, by the strength and the practically unyielding nature of the confining vessel, any expansion of the confined liquid when cooled. The sound made by the falling of a metal ball previously placed within the cylinder, told whether the water within was liquid or solid. Under these conditions, the experimenter above named found that water remains liquid even at a temperature of -18° C. (= -4° Fahr.), but freezes instantly so soon as the plug is removed.

**CIRCULATION OF AIR IN THE ST. GOTTHARD TUNNEL.**—M. Stapf has been giving careful attention to the variations in the air currents between the two openings at Goschenen and Airolo. He finds two principal causes to be operative in these changes; first, the southern opening is 32.8 yards higher than the northern, which represents a pressure equivalent to that of a column of air 39.3 yards high at the subterranean temperature; second, the difference of barometric pressures upon the two declivities of the mountain. If the external temperature was always lower than the internal, if the barometric pressure was the same at each side, and if there were no modifications of velocity due to the heating and expansion of the air, or to the friction against the walls—the draft would always be southward. Meteorological observations are regularly taken, both at Airolo and Goschenen, to determine the elements which are required in order to know, monthly or annually, the number of days for which a given direction of current, or an absolute calm, may be expected in the interior of the tunnel.—*Les Mondes*.

**THE LICK OBSERVATORY TELESCOPE.**—Our readers are aware that the trustees of the Lick observatory have finally closed the contract for the optical part of their great telescope. There has been considerable doubt whether a refractor or an enormous reflector would be selected, but the decision is in favor of the former. The object glass is to be three ft. in diameter, and the Clarks, of Cambridge, Mass., are to make it for \$50,000. The mounting for the instrument is not yet provided for. It will probably be about three years before the telescope is finished. If the instrument proves successful, it will be the most efficient ever pointed at the heavens. Its power will exceed that of the Pulkowa glass by 44%, and it will be almost twice as powerful as the great telescope at Washington, which at present is the best of its kind.

**WHAT WE THINK WITH.**—Without phosphorus no thought. So declared a famous German physiological chemist some years ago. That particular brain substance which he supposed to be essential to thought has heretofore been known as proteogen with phosphoric acid. Considering this name not clear and definite, another German chemist has proposed for it the following precise and significant combination of 72 letters: Oxaethyltrimethylammoniumoxyhydratylepalmethylglycerinophosphosane. If mental derangement is in any way due to deficiency in the elements of this highly-complicated compound, or to any enlarging of its multitudinous constituents, the wonder is that anybody can ever think straight. And what a lot of it that German must have had in his head when he contrived such a name for it!

**ARTIFICIAL VANILLA.**—The production of any well-known substance artificially by the synthetic chemist, is generally viewed by the public with opposition, until convinced that it is identical with the natural product. A German paper produces an endorsement of artificial vanilla by Prof. Meidinger, who says it possesses undeniable advantages over natural vanilla. The latter loses its aroma, is unequal and the natural bean only contains 2% of valuable material, with 98% of worthless or even injurious material, of which the removal is troublesome and tedious, before the pure flavor can be obtained. Dr. Meidinger speaks very highly of this artificial vanilla, which he pronounces perfectly wholesome.

**DETERMINATION OF SILICON IN IRON.**—The following process is adopted by Mr. T. M. Brown: One gram iron or steel is placed in a porcelain crucible with 25 cc. nitric acid of 1.2 sp. gr. When the reaction is over 24 to 30 cc. dilute sulphuric acid—1 part acid and 3 parts water—are added, and the solution is heated till the nitric acid is entirely or nearly expelled. When the residue is sufficiently cool, water is cautiously added, and the contents of the capsule are heated till the crystals are perfectly dissolved. The solution is then filtered as hot as possible, and the residue washed first with hot water, then with 25 to 30 cc. hydrochloric acid of sp. gr. 1.20, and finally again with hot water. After drying and ignition the silica is obtained snow-white and granular.

**ARTIFICIAL SPINEL AND CORUNDUM.**—M. Stanislaus Meunier, a French savant, is reported to have succeeded in producing artificial spinel, identical in hardness and chemical composition to the natural mineral, by heating together in a porcelain tube chloride of aluminum, metallic magnesium, and the vapor of water. By the interactions of water vapor and aluminum chloride, he affirms, he has also succeeded in producing artificial corundum.

**STRENGTH OF INSECTS.**—At a meeting of the Maryland Academy of Sciences recently Dr. Theobald showed a species of a beetle and gave the following figures: Weight of beetle, two grains; weight moved by it, 5½ ounces—2,640 grains, or 1,320 times the weight of the beetle. A man weighing 150 lbs., endowed with the strength of this insect, should, therefore, be able to move 198,000 lbs., or nearly 100 tons.

**MOUNTAINS IN THE MOON.**—The moon has 28 mountains higher than Mount Blanc, that monarch of mountains in Europe. The moon's day is 29½ times as long as ours. The sun shines constantly for 15 days, making a temperature like boiling water.

SIEDER & FORNI, who have been steadily working for

the past month developing a quartz lode at the head of Dark canyon, about a mile northeast of town, have already struck pay ore, and are highly pleased with the outlook of their mine. They tapped the ledge by a short tunnel from the sidehill, and are now running in on the lode.

**SURT. CHIEF.**—The Eureka, says that they have cut through the vein on the 21 level, at a depth of 170 ft., that the ore shows well, and that a four-man force has been put on to run in on the lode both north and south.

**COPPER.**—*Mountain Democrat*, Feb. 25: Supt. Lambert, of the copper mine on the Auburn road, between Coloma and Pilot Hill, has, after a protracted absence in the East, been prompted by the enhanced demand for copper to return and renew operations on his mine, and the result thus far obtained has been much more flattering than he anticipated. He has already developed a vein, from 20 ft thick, of very handsome ore, and by driving the old tunnel forward, which, when extended 200 ft further, will give not less than 400 ft of superabundant ledge. The chief feature of this copper mine consists in the fact that it includes a gold-bearing vein that, unless the prospecting thus far done shall prove deceptive, will fully pay the expense of opening the large and apparently rich copper mine. Samples of the different formations in the main ledge, iron, garnet and copper—can be seen at this mine, and those experienced or curious in such matters are invited to call and make an examination.

**NORRIS.**—Peter Cross, the prince of prospectors, has added to his many previous discoveries one which promises to be the richest of all. He has opened a large and fine ledge near Newtown, from which a considerable quantity of \$30 to \$50-ore has been taken out within the past week. The company that bought the Chapparral mine, near Chilo, has some time ago, concluded last week a purchase of the Copper mine, Kelsey district, which is one of the richest quartz ledges in the county. It has been sufficiently prospected to justify immediate prosecution of the work of systematic development on a permanent basis, and we are told that the new company will at once commence the erection of a 20-stamp mill and hoisting works.

#### INYO.

**REARSBORO.**—*Inyo Independent*, Feb. 25: Work will be started in the Rearsboro tunnel in a few days, under the direction of T. F. A. Connelly. It is intended to run 200 ft on the tunnel. Contracts will be let for 50 ft sections.

**ANOTHER MINE SOLD.**—Mr. W. E. Smith, prominent in the Cerro Gordo mining company, the New York corporation which has purchased so many mines in Siskiyou, Swanssea district, during the week completed the purchase of the Long John mine in the same locality.

**FREE GOLD.**—*Herald*, Feb. 25: Gold dust to the amount of \$8,000 was yesterday melted into a bar at J. J. Ott's assay office, the same being the result of a clean-up in the hydraulic claim of A. C. Turner, at Hunt's hill. The run was made with free water and with a small force of men; it is, therefore, a large and most satisfactory return to the owner.

#### MONO.

**BODIE ITEMS.**—*Free Press*, Feb. 24: During the first three weeks of February the Standard Con. shipped \$201,365.03, against \$185,645.70 for the entire month of January. Last month Bodie mines other than Standard shipped \$99,044.23, which aggregate total probably be considerably increased this month, inasmuch as several more stamps have been started up, so that it is safe to predict that the bullion shipments from this district for the month of February will exceed \$400,000. The Goodahaw, Oro, South Bulwer, Boston Con., Noondays (combination), Red Cloud and Lent (Bodie-Mono combination) main shafts are being sunk, and the Blackhawk is sinking a winze (now 70 ft deep) below the 700 level. All the heavy machinery for the new Lent shaft—which may be termed the great sump of the center—is on the ground, and is being put in position with all possible dispatch. The first installment of the Standard's new and powerful hoisting machinery has arrived, and another invoice of about 20 tons is on the road this side of Carson. The new 350-horse power Harris-Corliss engine is being put in position to drive the Noonday mill, and the 10 additional stamps will be put in at an early day, increasing the capacity to 40 stamps. The new hoisting machinery at the Red Cloud shaft—the sump of the south end—will start up Tuesday morning, hoisting water through two 12-inch cast iron columns. The shaft itself is being sunk as rapidly as human skill and the most approved appliances can drive it. The Silver Hill mill is cleaning up from its last run, and will start on Blackhawk ore within a few days. At the Miners' mill a large settling tank is being put in, and the mill will resume work on Wednesday. All the other stamps in the district, 120 in number, are busy. The underground developments for the week have been most encouraging at various points along the lead. The Syndicate, at the extreme north end, is still stopping and milling ore from the 380 level, old Osceola vein. Ore from the Peacock vein, No. 20, Bodie tunnel, is yielding much better than was expected, and the north and south drifts are being worked. The ore vein in the Blackhawk, which was being followed by a winze from the west crosscut, 700 level, has taken a somewhat eccentric turn and dipped away to the eastward, but at the point where it left the winze it was still holding its own in size and quality. Con. Pacific showed marked improvement at two different points and depths during the week. Standard Con. is getting close to ore in the west crosscut, 1000 level. Adolphus, having completed the most water, has commenced on the east crosscut, 500 level, has culminated the crosscut and is now drifting north. The north drift in the large or east vein of Concordia gives strong indications of an important development at an early day.

#### NEVADA.

**HARTLEY MINE.**—*Grass Valley Union*, Feb. 25: The Surprise mining company have removed their hoisting machinery from Allison Ranch, and are preparing to set it up on the Hartley mine, which they have bought. A new incline will be sunk, over 200 ft in depth, to reach to the bottom of the old workings. Good progress will be made with this work after the new hoisting works are erected, as the ground is favorable. In the meanwhile the work of cleaning out the drain tunnel will be carried on, in order to drain off the water from the old workings. The cave which occurred in the tunnel has not yet been cleared away, and operations have to be conducted carefully, and the ground thoroughly timbered as the debris is cleared away.

**MOORE'S FLAT MINES.**—*Nevada City Transcript*, Feb. 25: The hydraulic mine, Moore's Flat, has a bright outlook. The work being done at present in the Dowling Blue Banks and Boston claims consists principally of stripping, but if the weather continues good a couple of weeks more, they will be in full blast, the 2 latter mines giving employment to about 150 men. The Chinese are pushing their tunnel ahead at the rate of 25 or 30 ft a day with Burleigh drills, and also washing some. Their tunnel will be completed this spring. The other claims in that part of the county are prospering, and many thousands of dollars will be taken out this season.

**A \$10,000 SUIT.**—E. W. Johnson has begun suit in the Superior Court of this county against the New York & Boston gold mining company, a corporation, the complaint setting forth that within the 2 years last past he was named, as defendant, and paid out for the benefit of the company diverse sums of money, amounting in all to \$16,000; that said sums of money were repayable on demand, and that no part of the same has been repaid. The New York gold mining company, which is the one intended in the complaint, was formed in New York for the purchase and development of the El Capitán mine, near this city. A few thousand dollars' worth of work was done, and the mine was abandoned. The suit is being defended. It is intimated that the suit instituted by Mr. Johnson will result in an investigation as to where all the money expended in connection with the enterprise went to.

#### PLUMAS.

**DURAN HILL.**—*Greenview Bulletin*, Feb. 25: This company has suspended operations for the winter, but will resume work again early in the spring.

**NORTH FORK.**—The mines on the North Fork of Feather river have had too much water, which has done considerable damage in carrying away sluices, derricks, etc., and completely suspending all mining for the present.

**SOUTHERN EUREKA CON.**—The new dump house is completed, and is now being filled. For the present the ore from the middle tunnel has to be hauled to the mill, but a tramway is to be constructed soon for the purpose. From the lower tunnel the ore is run direct to the mill.

**GREEN MOUNTAIN.**—The mills of the company have run uninterruptedly since the repairing of the last break in the ditch on the 10th. There is no difficulty now in maintaining a full head of water.

**SAVACOR.**—This mine is reported under full headway, with splendid prospects. The only trouble they have to contend with is in getting the ore from the mine to the mill, which is passed through chutes. The new mill works finely.

**CHEROKEE.**—No stoppage of work has occurred at the mine, though the mill could not be run steadily until within the last 3 days.

**COLA STRIKE.**—The usual activity prevails at this mine. A survey recently made shows that the Kerr tunnel has to be driven about 50 ft further to reach the Cowdin chute.

**INDIAN VALLEY.**—The payment of the purchase money for the Indian Valley & Union mine has been made. The purchasers are Corbin & Handy, who will soon turn the property over to the Indian Valley mining company, of which Mr. Frank Corbin is President, and E. A. Corbin Secretary and Treasurer. The price paid is \$100,000, which was given equally to Mr. John Blood and George F. Tins, the former of the Mosses, Corbin are of New Britain, Conn., and the other owner is Dr. George W. Handy, of Oakland. It will be but a few days before the tunnel from the Union will be connected with the Indian Valley shaft, when all the ore from the latter will be run down the tunnel to the mill, now all in complete order, and situated near the mouth of the tunnel. The ore is remarkably rich, and everything is so conveniently arranged that the cost of working it is but very slight.

#### SIERRA.

**STILL IN GRAVEL.**—*Mountain Messenger*, Feb. 26: The Bald Mountain Extension tunnel is now in near \$280 ft, 200 of which pierces fine blue quartz gravel. On removing boulders from the bottom, the holes instantly fill with water significant of a near approach to bedrock.

#### NEVADA.

##### WASHOE DISTRICT.

**C. & C. SHAFT.**—*Virginia City Enterprise*, Feb. 27: The shaft has been sunk 10 ft; total depth below the 2500 level, 30 ft.

**UNION SHAFT.**—The shaft has been sunk 10 ft. Repairs to the shaft are being made at the 1000, 2200 and 2500 stations.

**MEXICAN.**—On 2500 level are cutting out a station at the 2700 level, in the joint Ophir east winze. The joint Union Con. east crosscut has been extended 30 ft.

**OPHIR.**—On the 2700 level are cutting out a station at the bottom of the joint Mexican east winze; the joint California upraise is being enlarged and timbered; the joint California east crosscut has been extended 51 ft.

**UNION CON.**—Are cutting a drain and raising timbers in the joint Sierra Nevada east crosscut. The joint Sierra Nevada east drill hole has been extended 245 ft.

**CON. VIRGINIA.**—On the 2300 level, on the lateral drift, a chamber is being cut out for a raise to the East & Belcher winze, and west crosscut No. 1 has been extended 29 ft.

**CALIFORNIA.**—On the 2500 level the joint Ophir east crosscut has been extended 51 ft; the joint Ophir upraise is being enlarged to the 2300 level, and the joint Con. Virginia west drift to the C. & C. shaft was advanced 34 ft. At the C. & C. shaft they are cutting out a bob station at the 2100 level.

**SIERRA NEVADA.**—On the 2300 level the upraise has been advanced 22 ft; total length, 584 ft. On the 2500 level the north lateral drift has been advanced 45 ft; total length, 600 ft. Ore raised during the week, 273 tons.

**ALTA.**—During the first 34 days of the past week sunk and timbered the shaft 15 ft; total depth, 1,775 ft. In the remaining 34 days excavated a tank station at a point 1,750 ft from the surface; placed a tank therein and also a donkey pump (plunger). Resumed sinking this morning. The water from the Justice causes a great deal of trouble. The pumps are running at 7 strokes per minute. Sump Tank, near Main Tunnel.—During the week repairs were employed repairing the track and cutting out a small sub-drain to drain the water from the track. South Lateral.—Number of ft at last report, 2,664; driven since, 38; total distance from Julia connection, 2,702 ft; total distance in Imperial ground, 362; total distance to Yellow Jacket shaft, 938; nature of ground in the face, soft and swelling; character of rock in the face, decomposed sandstone, with clay seams and no more inches of copper shifts put in 4 sets of timbers, covering 13 ft of ground, which completes the 150 ft of swelling ground commenced Jan. 25th. The repairs were then moved back to the carriage station, 519 ft from the face. From this point, working forward, 120 ft of ground was repaired and timbers cased, and 5 new sets of timbers put in; also, about 300 ft of 15-inch air pipe was placed in position. Thirty-five ft back being cased and set in more inches of water is coming in, but the face is nearly dry. Flow of water in standard gallons per 24 hours, 3,320,000.

**YELLOW JACKET.**—During the past week we have advanced the Suro tunnel drift 80 ft, the face being in very hard ground, requiring no timbering. We are repairing the pump shaft and replacing the 2 defective rods; also, double strapping the pump rod has occupied part of our time.

**SILVER HILL.**—During the past week we have opened our bulkhead on the 900 level for repairs, which gave us so much additional water that we have been obliged to pump into our 380 level. For the last 2 years we have taken most of the Alta and Justice companies' water, for which we have received no compensation. After 2 weeks we will be in condition to pump to the surface, provided satisfactory arrangements are made.

**CON. VIRGINIA.**—Running the pump and making repairs on the 2000 level.

**SAVACOR.**—Relieving timbers and lagging of the Incline and driving on the 2100 level.

**O. & C. AND B. & B. SHAFT.**—Bob pits Nos. 6 and 7 are completed and timbered; working still on Nos. 3 and 4, and making good progress with the work.

**C. N. S. SHAFT.**—During the week another section of hydraulic pipe has been put in. Are leveling off in the 2400 station for pump foundation; leveling the bottom of the cooling pond and cutting a ditch for suction pipe; running both tanks helling water.

**OVERMAN.**—The east drift, 2275 level, has been extended 50 ft; total length, 330 ft; face of drift is in hard black clay. The Forman shaft has been sunk and timbered 5 ft, and sinking suspended to cut station for balance box and pumps. Good progress has been made cutting station.

**BELCHER.**—The timbering of the 10th level tank station was completed Saturday. The old gaskete were replaced by new ones in the compressed air pipe for a distance of about 600 ft during the week. The pump is running at 61 strokes per minute and keeping the water 33 ft below the 2100 level.

**THE PUMPS.**—The pumps have been run on an average of 16 hours per day, consuming 64 cords of wood per day. We are pumping about 3 inches of water for the Belcher company. The Forman shaft has been sunk and timbered 5 ft, and sinking suspended to cut station for balance box and pumps.

##### EUREKA DISTRICT.

**PROSPECT MOUNTAIN MINES.**—*Eureka Sentinel*, Feb. 26: The Deadbroke series of mining claims, consisting of the Deadbroke mine, containing 600 linear ft, has produced from the surface down to the tunnel over 100 tons of ore, consisting of galena and gray carbonates, averaging from \$80 to \$100 silver per ton and 65% lead; also a small percentage of gold. The mine is open through a tunnel 300 ft in length. They have cut the ledge at the distance of 1200 ft, and have connected with the old workings at 225

ft, facilitating ventilation for a greater depth. The total depth from the surface at present is 200 ft; there is about 1,000 ft of work done on the mine. The New Year mine, south of April, adjoining the Deadbroke, contains 800 linear ft, with the same character of ore. The work performed on this mine amounts to about \$1,000. Triangle No. 1 is a location lying east of the Deadbroke and New Year mines. Triangle No. 2 lies west of the New Year and Deadbroke mines, and contains the same character of ore. The Volk and Plauton mines contain 350 ft. This mine is opened by a tunnel 150 ft in length. Its present depth is 140 ft. There have been several tons of choice ore extracted. The nature of the ore is gold quartz, averaging \$240 gold and from \$30 to \$30 silver per ton. All of the above properties are situated on the western slope of Prospect mountain, southerly and westerly of the Williams, Silver Connor and Metamoras mines.

**ORR SHIPMENTS.**—The storms of the past week have seriously interfered with the shipments of custom ore, and about the only mine now sending any ore from Prospect mountain is the old reliable California. With the opening of spring shipments will be resumed.

**WILL START TO-DAY.**—The new machinery of the Albion is now in place, and will be started to-day. It is the most up-to-date battery and has been put in a substantial manner. The mine can now be prospected to a great depth.

**EUREKA CON. PAY DAYS.**—The Eureka Con. will change their pay days this month. The furnace hands will be paid on the 25th; miners on the 27th, and town bills on the 28th. This company discharges between \$70,000 and \$80,000 in this camp every month.

**THIS WILL BE THE LAST.**—The work of prospecting this valuable Prospect mountain property is being actively pushed, and a rich strike on one of the lower levels is reported. This is one of the mines of Eureka district that has paid largely from the grass roots, and it is confidently anticipated that it will soon rank itself among the great bullion producers.

##### TYBO DISTRICT.

**CLOSED DOWN.**—Cor. Eureka Sentinel, Feb. 25: The Tybo Con. M. Co. have closed down both of their mills and mine, which have been running steadily for the past 3 years—on ore taken from the famous 2 O mine, and which has also for two years past kept two furnaces, of 50 tons capacity, steadily running. Still the mine abounds in ore from top to bottom. The engineers and foremen of this property are entitled to great praise for the manner in which its affairs have been conducted, and no accident of any moment has occurred since the starting of the works up to the present time. It is to be hoped that the stoppage of work will be but of short duration, as Tybo has a good reputation as a bullion producer. A rich discovery has just been made in the Snake canyon by E. Mayer, who found a ledge of white quartz from 3 to 8 ft wide, with assays which give from \$50 to \$1,400 per ton. A person can walk on this ledge for a distance of 3 miles. All who have seen the ledge say it is the largest in the State of Nevada. If the new find was only located some 200 miles away it would cause a tremendous stampede, but as it is near at hand nothing of importance is said about it.

##### ARIZONA.

**COAL.**—*Silver Belt*, Feb. 19: Just as we go to press we are shown samples of coal, apparently of fine quality, found within 20 miles of Globe district. The coal is anthracite, and in quantities practically inexhaustible by the present generation. We have time only to say that the bed is accessible to the proposed route of the "Arizona Mineral Belt R. R.," and that Mr. Eddy takes with him East, to-day, a box of specimens for scientific and practical analysis.

**NEW MILL.**—*Phoenix Herald*, Feb. 24: The 5-stamp quartz mill of Jett & Powell, will drop its first stamp about March 10th. The machinery is all on the ground, and the timber is being marked and will arrive in a few days. The mill location is 3 miles north of Phoenix, on the Black canyon road, on the north bank of the Grand canal, which supplies the water. Ore will be brought from the Winfield district, 11 miles, at a cost of \$2 per ton, and as it costs but \$3 at the outside to take it out the ground and run it through the mill, it makes a total cost of \$5 per ton. Two working tests of ore from this district—one at the 2-stamp mill attached to the Phoenix mine, last year yielding \$45, and another of 4 tons at the Gold Hill Con. mill some months ago gave \$28 per ton—show that a very handsome profit is left from the poorest, after deducting the \$5 expense.

##### IDAHO.

**SWAN'S MOUNTAIN.**—*Cor. Idaho World*, Feb. 19: The Rising Star looks fully as well as ever. The ledge is about 2 ft wide and a liberal sprinkling of free gold can be seen in the sulphurates. The indications are that the chimney will hold out for some time yet. The Paymaster tunnel is being driven nine ft per week. The Doctors calculate on having to run 100 or 150 ft to reach the ledge. The North Star shows the best rock of any ledge on the mountain. You can scarcely pick out a piece without finding gold in it. Mr. Plauton has two tunnels. One is already tapped, the ledge 30 or 40 ft below the surface, is now running on the vein. The other will tap it 30 or 40 ft deeper.

**YANKEE FORK.**—*Herald*, Feb. 19: Charles Harris was up from the Yankee Fork gravel company's claims last Monday. He and Wm. Hall and O. R. Drake have a tract of placer ground on the Salmon, 4 miles above the mouth of the Yankee Fork. They are taking it by drifting, and will make a handsome strike as soon as they can wash in the spring. Mr. Harris showed us the prospect from 3 pans of dirt that shows the ground to be rich. The gold is rather coarse, and of a fine quality. There is undoubtedly large tracts of placer ground on the Salmon, and rich placer strikes may be looked for as soon as prospectors branch out in the spring. The Badger tunnel is in 218 ft, and has tapped the ledge, with good prospect for a mine. The tunnel is now being run on the ledge, and work will be pushed as fast as possible, so as to develop and open up the property in good shape for working. The men are not troubled with water in the back end of the tunnel. The water in the Yankee Fork is of a deep red since the starting up of the Custer mill. No more fish need be looked for in that stream. Lovers of salmon should go without their luxury, and eat them shipped in future. Messrs. Robert Orr and Oliver Blanchett are getting along very well with their tunnel contract at the Summit mine. They are now in 70 ft. A good many men are at work in the Custer and Unknown mines.

**EAST OF THE MOUNTAIN.**—Mr. J. W. Hamilton visited Bay Horse on his way home, and went through the Juliet mine, which, he informs us, is 2 ft wide and the ore rich. The Juliet is one of the best mines in the district. Two mines on Squaw creek were lately sold to Boeton capitalists. All the mines in that section have been proven good by development, and lively times are expected soon, as the managers of the smelter have arrived and will start up before long.

##### MONTANA.

**BULLION.**—*Butte Miner*, Feb. 22: The hullion shipment for the week ending Saturday, Feb. 19th, footed up 2,643 lbs, valued at \$40,288. This is considerably lighter than last week, but it is reported that about 1,000 lbs of bullion, not included in the above, is ready for shipment.

**THIS FORMER JURY MAN.**—From Mr. D. D. Budd, in from the Fourth of July district, we learn that that district, although in a snow-bound condition, is not entirely buried with snow. Work on the Fourth of July mine is going on steadily, and the mine is showing up well. A tunnel, run from the ore-house, 180 ft in length, has tapped the vein about 60 ft deep. Levels have been run both ways from the tunnel.

**STEVENS.**—The west side of the Stevens has now reached a depth of 102 ft. The sinking is slow work, on account of water. The shaft is an incline, following the vein down on a dip of about 60°. Three 8-hour shifts are sinking the shaft. The vein, at the bottom of the shaft, is 6 ft wide, 3 ft of which is first-class ore of high grade.

Next week, levels will be started east and west from the shaft that will open up the ore body in shape to stoop out, when the exact extent and richness of the ore can more easily be arrived at. It looks well and prospects well.

**ANSELMO.**—The main shaft still follows the vein, and it has been lowered considerably, with no unusual amount of water. From the levels of this mine the output of rich ore is satisfactory, and the quality up to the figures recently reported.

**HOPK.**—The incline shaft of the Hope mine is being pushed downward daily, and is making fair progress, having now attained a bottoming of 175 ft. Sinking will be continued for a time. No ore is being taken from the levels at present, the work being confined to shaft sinking.

**A LUCIRA.**—Opening work on the Belcher is going on. A well-timbered main shaft, 5 ft 8 inches by 3 ft 8 inches, is going straight down. Much water retards the operation of sinking, which is in tolerable hard granite. It is the intention of the owners to push the shaft down 50 or 75 ft, and then crosscut for the vein, and if the water does not flow in too freely, the Belcher will be again an ore-producing mine.

**NOTES.**—About 80 tons of Allice ore are reduced daily at the mills of that company. All the stamps of both mills are dropping daily. The Mountain Boy, Ophir and Stevens are reported to be in a flattering condition. Most all of the mines worked in Summit Valley district are reported to be looking decidedly well.

**ALICE.**—The ore-faces on the 100, 200, 300, 400 and 500 levels are reported as presenting their usual appearance. Hoisting of ore from these levels continues daily without interruption. The amount of ore lifted from these levels per diem is sufficient to supply both of the 00 and 20-stamp mills, and the amount of ore on the dump-pile, which is huge, remains comparatively intact. Eighty tons per day is about the output of the mine.

**LEXINGTON.**—Work at the Lexington's old incline shaft is steadily pursued. The rich ore chute lately reported holds its own, and the work of extracting ore is now mainly confined to stooping in the 30 level east of the shaft. High-grade milling ore is being hoisted. The new 500-ft double compartment shaft, after having reached, in good shape, a depth of 130 ft, is temporarily stopped. It will be started up again soon, when the steam hoisting and pumping machinery will be put in successful operation.

**MORNING STAR.**—At the Morning Star mine no ore is being hoisted at present. Sinking of the new shaft is prosecuted energetically. Heavy water is being pumped out of the shaft at times, which taxes the pumping capacity of the machinery, but the water is lighter now than heretofore.

**OAGNON.**—Things are running evenly at the Oagnon, where a good-sized pile of rich-looking ore is hoisted daily.

##### NEW MEXICO.

**CENTRAL CITY MINES.**—*Herald and Southwestern*, Feb. 19: On the Henry Woods mine, of Central City district, the owners are now sinking on the main lead and have a good body of fair grade ore. The ledge varies in thickness from 10 to 50 ft. On the Hutchinson mine there is a shaft 45 ft deep, measuring 7 ft by 10, now being sunk. The mine have been put to work and a crosscut, which will strike the metal at the depth of about 50 ft, being run. This mine belongs to H. J. Hutchinson & Co. The well-known San Pablo has a shaft 40 ft deep and a body of ore 4 ft wide. The ore is a sand carbonate, and there can be no doubt that this mine would command a high price, even as at present developed, were there plenty of capital in the country. Smith & George, of Georgetown, have a 75-ft shaft on the mine, and have a large quantity of ore on their dump, assaying well both in gold and silver. The first extension north of the Knickerbocker is known as the Pius IX. Work on this mine was commenced about 10 days since, and the shaft, at the depth of 10 ft, shows a 4-ft vein of fine smelting ore, samples of which can be seen at Sam's saloon, in this city. A number of other claims are being worked with good results.

##### OREGON.

**THE MONUMENTAL.**—*Bedrock Democrat*, Feb. 16: A correspondent writes thus of this valuable mining property: The mill is still running on the rich ore, and the ore continues to be mined away until the end of March. The ore is being splendidly—yielding \$1,000 every 24 hours. When the mill shuts down in March a wagon load of silver bullion will find its way to Baker, where it will be freely circulated by several of our Baker boys now employed here.

**THE TOM PAYNE MINE.**—Several reliable persons visited the celebrated Tom Payne mine last week, situated about 8 miles from this city, in Polk county district. They reported the owners, Hayes & Co., thoroughly developing it, and the mine is now producing rich ore ready for crushing. From all appearances the ledge is a true feature vein with a tendency to widening the further they sink on it. We are glad to hear such cheering news from this mine, and shall entertain great expectations of it the coming summer.

**NOTES.**—*Oregon Sentinel*, Feb. 19: Work is going steadily on in the Schnapp tunnel, near Willow Springs. The Applegate hydraulic mining company are again piping, having repaired their ditch. All the large Oaile creek claims are running again with full heads of water. Berryman & Co. are drifting on Applegate and realizing \$8 per day to the hand. Every claim in the Willow Springs camp is being worked on full time and water plenty. Cook & Anderson have struck good pay on Prairie fire, but the water is not expected to last long. Frank Town, of Sterling, says there never was a better prospect for a suitor than there is at present. Sam Luckend, Supt. of the Star Gulch hydraulic mine, is moving large quantities of dirt, utilizing his water every hour during the day and night. Tom Kahler has been picking up "chunks" in the claim of McDougough, Kahler & Co. at Fort Laugarain. Last Sunday he picked up one worth \$25. Mr. Williams, of Pleasant creek, tells us that the shaft was done in the camp by the stamper, and that miners are generally busy making the most of the water. Dessels & Co., on Scott gulch, Josephine county, have not been using their elevator since the commencement of the storm, having been using their water to better advantage.

##### UTAH.

**LITTLE COTTONWOOD.**—*Cor. Salt Lake Tribune*, Feb. 10: The following mines will be in active operation this season besides many others on a smaller scale: The Flagstaff group, consisting of the Flagstaff, South Star and Titus, Virginia and Nahoh, will employ a large lot of men. The American Emma, having all its difficulties settled, will start up with ponderous machinery and every available facility to make it, as before, rank as one of the leading mining properties on the coast. The Joah Lawrence, of course, will resume its former title as one of the leading ore producing mines, and employ a large force of men. Joe Mariou says the Rough & Ready mine is the boss of the hill and only requires developing, which he will do the coming spring. It already has a fine vein of high grade ore. The Buffalo, McKay, Little Cottonwood tunnel and Mand are only waiting for spring, when active operations may make the most of the water. Dessels & Co., on Scott gulch, Josephine county, have not been using their elevator since the commencement of the storm, having been using their water to better advantage.

**A LARGE DROP HAMMER.**—weighing 1,500 lbs., was cast at the Sweepstake Factory, San Leandro, two weeks ago. The hammer is one of the largest in the State, and will be used in the new shop at Benicia.

### The Mining Outlook in New Mexico.

The mining outlook in New Mexico is at the present time better than ever before, and during the coming year we look for much active work in the new districts. Gold, silver, copper and lead are being found in all directions, and the excitement reminds one of the early days in the older States. To the south of us the White Oaks are receiving a great deal of attention, and mills and smelters are being constructed to work the ores of that camp. At the Magdelenas a smelter is completed and ready for operations. At Socorro the mines are looking well, and several large sales have recently been reported. The reports of the riches of the Black Hills, the Mogollons, the Santa Ritas and other points, are being sent abroad by returning prospectors, and are attracting the attention of many. At Shakespear the ore is improving, and a mill is already projected. The Lone Mountain district is producing good ore, and the Carrollton mill will be erected there. The Mimbre company have a large mill at Georgetown ready for operations. The mines about Silver City continue their regular shipments of bullion, and this fact is inducing some to visit that point. In Taos county many are turning their attention to prospecting who never before gave it a thought, and some encouraging reports have reached us from there.

In Colfax county not much is being done. The Rebel Chief mine is working a force of men, and a sufficient body of ore is now exposed to warrant the erection of a mill; machinery for which was recently ordered from New York. Other mines in the county are just as valuable as the Rebel Chief, and all that is required is the capital rightly expended to develop and work them to place quite a number on a paying basis. Many men will visit us during the coming summer for the purpose of investing their surplus capital, and mine owners should clean out their old tunnels and shafts and be ready to exhibit their properties to all intending purchasers.—*News and Press.*

### San Francisco Harbor.

#### The Government Engineer's Report.

The Secretary of War has transmitted to the House of Representatives an elaborate and highly interesting report prepared by Colonel George H. Mendell, of the United States Engineering Corps, in response to Horace Davis' resolution calling for information as to all causes tending to diminish the tidal area of San Francisco bay and lessen the tidal scour on the bar, and thereby decrease the depth of water on said bar, and diminish the value of San Francisco as a commercial harbor. Colonel Mendell first specifies the natural causes which are practically not subject to control. He describes the drainage system of the rivers emptying into San Francisco bay, and shows how the rapid fall of their tributaries and violence of the rains favor the erosion and transportation of earthy matter from the mountains, and the steady conversion of marshes into dry land. The present extent of marshes in San Francisco bay, including Suisun and San Pablo bays, is stated at 300 square miles. Mention is next made of similar tendencies of

#### Hydraulic Mining.

The report then proceeds to consider the artificial causes, such as the construction of piers and jetties, and the utilization of State and city grants of submerged lands. Referring to the pier and training walls at Oakland, Colonel Mendell says: "The tendency of these structures is to hold the material deposited along the shore, and, therefore, to concentrate in a small area that which otherwise would have been distributed over larger areas. This effect can never take great dimensions." He reports, in regard to the apprehended shoaling of the bar outside the entrance to San Francisco bay, that a comparison of the survey made in 1855 with one last made in 1873 shows that the bar has not retreated and that the depth of water on its crest has not been diminished. He therefore says it is safe to state that the bar was as good in 1873 as in 1855. No survey has been made since 1873. After discussing various

#### Features of the Problem

Suggested, Colonel Mendell concludes his report as follows: "The foregoing description of the bar demonstrates that it is able to lose a great part of its advantages and yet remain an admirable channel for commercial purposes. At present this channel is 11 miles wide. If we suppose the bar to move shoreward until it is shortened to half its present length, it is apparent that a largely diminished tidal prism might be able to maintain, over the shorter line, the depth that it now maintains over a longer. The depth of the crest might be reduced to much narrower limits than the one last named and yet remain an excellent channel, and be maintained by a tidal area, only a small fraction of which now contributes to this result. If we suppose the crest of the bar to maintain its present position, instead of retreating, the effect would be

#### A Diminished Channel,

Resulting from filling the interior of the bays, to encourage the growth of existing shoals, and to form new shoals. These shoals would shorten the crest, and lessen the area of the channels to be maintained. The result would be practically equivalent to that to be produced by the retreat of the bar shoreward, and between these shoals one or more channels would remain. The access to the harbor under these circumstances, although far inferior to the pres-

ent conditions of convenience, might still compare favorably with the approaches to many of the great commercial ports of the world. It appears to be inevitable that this interior hays must continue to loss in area. The force of gravity works incessantly to that end. There is no compensation in any other natural force. The commercial necessities are in the same direction. Nature and man seem to be under a common necessity to lessen the tidal areas. Yet the ultimate disaster appears to be remote in the future. We are not, however, on that account delivered from obligations to counteract these tendencies, nor are we powerless to do so in some degree." Col. Mendell proceeds to indicate what steps should be taken.

#### Without further Delay,

And means of accurately determining upon the best remedial immediately afterwards. "He recommends that a new survey of the bar be made forthwith, and that periodical surveys, both of the bar and of the shoals about the bay, be provided for. Another subject for investigation is the relative scouring value of equal quantities of water stored in different parts of the great bay. This, he says, would indicate some measure of the consequences to follow from the loss of the lower part of the tidal prism of Suisun bay, a result that may be near at hand. He adds: There seems to be some ground for the opinion that the bar would not be greatly affected by this result. The influence of hydraulic mining, as compared with what may be called natural influences, would, of course, be an available topic for study in this connection, as mining is subject to control. The question as to what extent the owners of submerged lands should be allowed to fill, is also important. These are not questions that can be solved in a day, or a year. During the period given to the investigations thus outlined, other points of inquiry will suggest themselves, and in due time information will be obtained sufficiently to demonstrate the soundness or unsoundness of the deductions now drawn from incomplete existing data.

### Design Patents.

Although the government has for several years granted patents for designs, the question of what constituted an improvement of "design patents" has not until recently been settled. In fact, the legal rights of the owners of this class of patents were not very well understood; that is the absolute right of such members had since been sufficiently defined. A suit which commenced over a year, was commenced by James W. & Isaac M. Miller, of Newark, N. J., to determine their rights to certain "designs" in jewelry, and the decision made by the court is of great interest to owners of this class of patents.

Justice Clifford, of the Supreme Court of the United States, delivered the opinion, which declares that patents for designs, as well as for machines, are authorized by the act of Congress, and that a design patent is something that the law protects, and that the trade must respect. In decisive language, the court determines the case in favor of Miller Bros., on all points, awarding a perpetual injunction, and an accounting of profits, and an assessment of damages against Albert J. Smith and Dutes Wilcox, of Providence, R. I., the defendants, and makes all jewelers, whether wholesalers or retailers, who have sold the infringing goods, liable for damages. This test case has received widespread attention from the jewelry fraternity generally, and "design patents" may now be regarded as "good for something," and "infringement" as a dangerous and unprofitable business. It needs only a sharp application of the law as laid down and defined by this eminent Judge of the Supreme Court to secure hereafter inventors and patentees of original and useful designs against the unscrupulous piracy from which they have so long suffered. The importance of the decision in its encouragement to inventors, and will appreciate, as protection is an incentive to the best efforts of skill in this as well as in every other field of productive industry and necessity, to bring our American manufactures to the highest degree of advancement and prosperity.

**THREE GREAT MINES.**—A Tombstone correspondent says: I think Tombstone has got three of the greatest mines on the coast for their age and development. The principal of these is the Toughnut which is running 25 stamps and shipping about \$180,000 per month. The mill is situated ten miles from here on the San Pedro river. The Contention is working about 60 men; it has 25 stamps also and ships about the same amount of bullion per month. But the Grand Central is the young giant of them all. It certainly is the finest mine in the district. About 6,000 tons of ore is now lying on the dump, all of which has been taken out of the mine while opening it. The company is building a 30-stamp mill which will be in running order about the middle of February. Then you will see the greatest bullion-producing camp on the entire coast. There are a number of fine prospects in and around Tombstone which will shortly come to the front.

**THIRTY-SEVEN** Leadville mines employ 2,097 miners and 144 teams, and \$230,700 are required monthly for wages. Thirteen mines have paid \$6,000,212 in dividends in the past year, or more, after paying their previous owners \$5,697,321 besides, and having \$920,000 cash on hand now.

### Improved Telegraphy.

An exhibition of what is known as the "House Postal Telegraph System" was given yesterday afternoon at the residence of the inventor, Mr. Royal E. House, No 83 State street, Brooklyn. The exhibition was well attended and considerable interest was manifested in the invention by those present. Mr. House was the inventor of the telegraph system used by the first telegraph company, out of which the Western Union company grew. By the system exhibited yesterday it is claimed that from 250 to 300 words a minute can be automatically transmitted, received and printed in ordinary type ready for delivery. It has been so perfected that the message can be received without the presence of an operator and transmitted at one-tenth of the present cost of transmission by the Morse system, not only in the matter of labor, but also in the number of wires used. Three machines are required to do the work.

Machine No. 1 is about the same size as the type writer and somewhat similar. There is attached to it a fillet of paper, and as the operator who receives the messages operates upon the machine, this slip of paper passes over two small lance-pointed knives, which strike it from below, cutting in it a slit each time of striking. These slits are alternate, parallel one to the other. Each slit represents a letter of the alphabet, the shortest slit standing for those letters most frequently used. The fillet of paper is then taken to machine No. 2, which is automatic in its action, and in which the power of electricity is used. As the paper passes through this machine an exact counterpart is made at the receiving station, recorded automatically. Machine No. 3—an automatic printing machine—prints the message in plain type as the fillet of paper passes through it. By an attachment to the receiving machine any station on the line can be called in automatically and thrown out without the presence of an operator. It is said that by this system only two operators will be required in transmitting a message from this city to Philadelphia, while at present a dispatch has to pass through about six hands.—*N. Y. Herald.*

**NEW CHLORINATION WORKS.**—Mr. Jas. M. White, the gentleman who superintended the erection of the furnaces at the Iron mine, says the Placer Herald, having a few months respite from duty in connection with those works, is improving the time thus afforded by erecting on his own account chlorine works, for the reduction of the sulphurets which accumulate in greater or less quantities at the quartz mill in this locality, and which heretofore it has been the practice to send away for reduction. He has selected a point on the tramline known as the Poland Flat, about a mile below Auburn, for the location, which, being a fair compromise between Auburn and Ophir districts, and easy of access, is thought to be very favorable. He has the necessary buildings well under way, and will commence at once to put in the furnaces. The importance of such works in this locality has often been discussed by our miners, and the favorable inducements from a business point of view to any who would undertake their erection, conceded. Mr. White is the one who steps in to fill the opening, to supply what is recognized to be a want, and we trust he will receive that encouragement from the miners and mill men that his enterprise deserves; and we may venture the hope, coupled with the belief, that as a business venture it will prove a success to its projector and a benefit to the community.

**RAILROAD CONSTRUCTION DURING 1880.**—The reading public are indebted to the *Railroad Gazette* for an interesting annual statement of railroad construction for 1880. It appears from this that the total mileage was 7,150, which is greater than for any year since 1872, when it was 7,340, that year being the culmination of a period of great energy and enterprise. During 1880 Dakota must be credited with the greatest activity (724) in new enterprises. Texas comes next (653), and then Ohio (500); Iowa is credited with 456, Kansas 363, Missouri 312, Nebraska 377, and Wisconsin 26. Since 1872, when the previous railroad building era culminated, only Texas, Iowa and Kansas have built more railroad than Ohio, as will appear from the following table, which shows the number of miles of railroad completed in each State that has built more than 1,000 miles in the eight years from 1871 to 1880, inclusive:

Texas.....	2,643	California.....	1,107
Iowa.....	1,730	Illinois.....	1,093
Kansas.....	1,550	Colorado.....	1,077
Ohio.....	1,393	Oakota.....	1,069
Minnesota.....	1,244	New York.....	1,065
Missouri.....	1,191	Wisconsin.....	1,037
Pennsylvania.....	1,123	Indiana.....	1,012

**POOR MINE MANAGEMENT.**—The Leadville Circular speaks of that district as follows: "This camp may be said in one sense to be wobbling. The number of pay mines has been doubled within a year, but the number of competent mine managers has not increased. One-half of the mines are being managed by men who hardly know porphyry from quartzite. Five-tenths of the mines have not been examined for six months by a disinterested expert. The owners really know nothing about them. They conduct their business as if it was a faro-bank gambling, and then they complain when they lose. Everyone who owns a substantial interest in a mine should have it examined by some one he can trust, who is not connected with the management, at least once every three months."

### California Petroleum.

In our issue of Feb. 12th, we gave at length a record of the year's work of California in the petroleum fields. The petroleum interests of California are much greater than most people suppose. The considerable region of southern California, which gives great promise of developing into an oil-producing section of vast productiveness, invites the attention of the public. It is a matter of deep interest to know whether the oil held is to be relied on as an important accessory of our successor to the Pennsylvania field. It is of interest, not only to California, but to all parts of the country. Citizens of Los Angeles, Ventura and Santa Barbara counties are numerous signing a petition to Clarence King, Director of the Geological Survey, directing his attention to the petroleum region in the counties named, and to the work of development prosecuted there since 1865. They say:

We represent that outcroppings of petroleum are found along the line of a belt of shale, about 80 miles in length, extending from the San Fernando district in Los Angeles county through the "Seespe," "Santa Paula," "Ojai" and "Sulphur Mountain" districts in Ventura county and the "Carpenteria" and "Santa Barbara" districts and terminating in the Pacific ocean off the asphaltum mines at "Goleta" in Santa Barbara county; that the remarkable and innumerable exudations of oil, and other encouraging indications which occur along this belt of shale have induced many of our citizens, and the citizens of other States, to engage in the work of prospecting and developing this region for the production of petroleum; that such work has been prosecuted without the aid or guidance of any thorough or reliable scientific investigation, and has involved the expenditure of an immense amount of labor and a million dollars in money with practical results, which are generally unsatisfactory and discouraging, which will probably be of sufficient aid to the geologist after a survey of the region in arriving at conclusions relative to the probable productiveness of the region which will be of most important practical use.

That the uncertainties and risks which attend the work of development in this region are excessive as compared with those which are incident to such work in Pennsylvania, owing to the difficulty to comprehend its geological construction and features, and to the peculiar difficulties experienced in boring wells.

The practical operators and capitalists familiar with the subject, unite in the opinion that the results of their work strongly tend to prove that large quantities of petroleum of good quality exist, and probably can be obtained in this region, but the uncertainties and risks referred to will discourage them from continuing or enlarging their operations, until they can have other and better guidance than their experience supplies.

Petroleum exists in many parts of this State, and the hope is indulged that in time not only our home market in the Pacific States and Territories, but Australia, China, Japan, British Columbia, Mexico, Central America and South American countries on the Pacific seaboard, will be all supplied with the product of these oil regions; but at present the petroleum district which we have mentioned and described, owing to the frequent exposure of geological structure, and to the superior importance of the developments already made, and its proximity to the ocean, which offers cheap transportation for the product, presents more attractive features to the capitalists, and offers more incentives for practical operations, and more data for scientific inquiry, than any other.

Wherefore, as the material interests of the country, which your survey is so well designed to develop, would be greatly promoted by the successful solution of the problem which is here suggested, we respectfully ask that a geological survey be made of the oil belt above described, under your direction and at the public expense, to determine the general character and extent of the oil-bearing rocks of that region; and in some district, which to you may seem most important and promising of desired results, to determine the legal stratigraphy, sufficiently accurate to enable the prospecting and development of the territory to be intelligently resumed.

**AN OLD PROSPECTOR GONE.**—Charley Stormes was shot and instantly killed at Tombstone, Arizona, on the 25th ult. Stormes was about 60 years of age and married. He came to this coast at an early day, in the flush time of '49; was well known throughout the Pacific coast, and wherever known, he was always liked. He had traveled extensively, had seen much of man and manners, was a genial companion and firm friend. He had followed all the excitements on the coast from Gold Lake to White Pine, making, however, his headquarters in this city. About a year ago Stormes left San Francisco for Leadville, Colorado, and from there traveled through New Mexico, finally bringing up at Tombstone, where he remained until his death. But little is known of Shaw, the man who killed Stormes. He is a native of Denver, and is said to be a desperate character. The trouble which led to the homicide is supposed to be founded on some gambling transaction.

It is said the postal card has decreased the sale of writing paper \$12,000,000 annually in the United States.

## THE ENGINEER.

## Steam on Canals.

The Belgian towing system does not seem to work well on the Erie canal. One hundred and eight miles of wire has been used during the past season. The wire has only been used by a portion of the traffic, horses having been employed, as in past years, for most of the towing.

The principal difficulty in the way of successful navigation by the system is in the sharp curves or bends of the canal itself. On straight portions it cannot be said to have done much damage, except in occasional instances; but abundant testimony is to be found of its destructiveness upon the canal banks at all points where short bends occur. At these points, the cable, instead of being in the center of the canal, is always hard to shore on the short side of the bend, and is frequently left on top of the tow-path or berm bank, as this case may be. In consequence of this, when the cable is picked up by the cable tug, the tug is forced hard to shore, and has the greatest difficulty in passing the bend, the tug and tow raking hard on shore, putting off docking, masonry, stone from slope walls, earth, sods, gravel, and causing them to fall into the canal.

Under the present arrangements the two systems work very inharmoniously. The dangers and difficulties of navigating the canal with boats towed by cable and horses are very great; one must give way to the other in every instance, and this the cable company refuses to do. It is fair to suppose that, as the cable system was intended for the use and convenience of boatmen, they would be quick to see its advantages. Two of the principal points which the cable company make are gain in time and cheapness in towing. Both of these they have failed to accomplish. These points are of vital importance to the boatmen; but after the past season's experience their almost unanimous opinion is that the disadvantages far outweigh the advantages.

**RAILROAD EXTENSION IN THE MISSISSIPPI VALLEY.**—The progressing and projected railroad extensions in Ohio, Indiana and Illinois will perfect the railroad systems of those States and largely increase the capacity of the system for business. The resulting competition which may be expected will give very reasonable rates for transportation. One hundred miles of road are being added to the Lake Shore and Michigan southern system, connecting Toledo with Chesterton, Indiana. The Indiana, Bloomington and Western Co. will complete the gap from Indianapolis to Columbus. The Chicago, Burlington and Quincy are making connections which will enable it to compete for Paubandle traffic. Articles of incorporation have been made for several other roads and extensions, which, when completed, will give a symmetry to the disjointed system which has grown up out of necessity.

**PROGRESS OF THE GREAT NEW YORK BRIDGE.**—The first of the heavy steel beams for the superstructure of the East river bridge have been received. The four great cables to be placed under the floor of the bridge from tower to tower, to strengthen the bridge against upward and lateral wind pressures, have also been received. They are regarded as the largest steel wire ropes ever made in this country. These ropes are made in seven strands each, 1,550 ft. in length and three inches in diameter. Every wire put in these and all ropes used in the bridge is tested in strength, elasticity and tension. The strength must equal 160,000 lbs. per square inch cross section. The strength must be not less than 4%, and the wire must stand being wound around an iron rod three times its own diameter without showing flaw or fracture.

**A GREAT DRAINAGE PROJECT.**—It is reported from Florida that an agreement has been entered into between the State authorities and certain Northern and Western capitalists to drain Lake Okechobee and the great swamp region southward known as the Everglades. The lake is about 30 miles by 40, and the entire area to be reclaimed is nearly twice as large as the State of New Jersey. The projectors claim that the drained land will make the best sugar country in the world. How they propose to accomplish the work is not stated. So long as the South has so much waste land suitable for sugar growing, without drainage, an undertaking of the sort described would seem to be rather speculative than practical.

**THE Harbor River Tunnel Enterprise** having fully recovered from the shock of the disaster of July last is now being pushed with renewed enterprise, and the work is approaching the New York shore at the rate of five ft. per day. The present system of working is a modification of that first adopted. While it is much more safe it is also said to be conducive to more rapid working, without any material increase in cost per running foot. Work on the New York shore will commence at an early date, and when the south tunnel, which is now alone being excavated, and has reached a distance of 150 ft. from the shaft, is brought as far as the north tunnel, both can be prosecuted simultaneously.

In the Arizona Legislature, the house has passed a bill repealing the tax on the net proceeds of the mines.

## USEFUL INFORMATION.

## Oil of Coffee.

From a paper upon the oil of roasted coffee, contributed to a chemical journal by Dr. C. O. Cech, of St. Petersburg, we condense the following:

Although the coffee bean belongs to our daily food, we are still uncertain of the chemical nature and composition of the products of roasting coffee, and of oil of coffee, one of the important characteristic constituents of the bean.

The existence of a coffee oil makes itself known in a striking manner by its roasting, for this oil, driven out of the beans by the heat, is partially volatilized, and, together with other products of the roasting, produces the characteristic aroma of roasted coffee, an odor possessed by no other substance. In very strong hiack coffee, too, we can see this oil like little drops of grease floating on it. The amount of oil in coffee varies from 8 to 13%, and at least half of this is lost in roasting, so that it would be a paying experiment to attempt to collect this oil, especially in large establishments where much coffee is burned and several pounds of oil are dissipated daily.

An effort to this end was recently made by Dr. Cech, which demonstrated that it was practical to save this oil in large establishments. At first there is scarcely any gas generated; but after the beans are browned and the whole mass has been heated to the temperature where the oil evaporates, such a quantity of the volatile aromatic oil is generated that it trickles down the walls of the chamber in which the beans are shoveled and cooled after coming from the drums.

Practice has proven that the very moment when the beans turn brown, the vapors of oil begin to pass off. If the heat at this moment is increased, the beans will be rapidly reduced to charcoal or take fire and be consumed. Cech has no doubt that the oil of coffee would find profitable use. The beans experimented on by him were not of equal value as regards the yield of oil, for while some contained as high as 13%, other kinds fell below 8%.

The oil of coffee is a green, thick, transparent oil, and after some time a few long needles were deposited from it. These proved to be caffeine. The coffee oil became turbid in half a year, although it was kept in hermetically closed bottles. Small groups of crystals were formed in the middle of the liquid, and slowly settled to the bottom, and at the end of three years the bottle was two-thirds full of a dirty mass of crystals consisting of the solid, fatty acids, but the upper layer of the liquid remained for years transparent, clear, and of a beautiful green color, proving that a portion of coffee oil consists of liquid oleic acid.

Although Dr. Cech has had the oil in his possession for three years, he has not determined its percentage composition.

## Curiosities of the Census.

The prying genius of the census taken often brings to light some very curious things. The Brooklyn (N. Y.), census superintendent discovered, among other things, that Jamaica Rum was Made From Old Shoes in that city. He was much puzzled, in his official duties, upon discovering that there was some use made of old shoes, which was not known to any of the deputies in his employ, and could not be discovered. It was found that old shoes were collected in large quantities by rag-pickers and junkmen, and sold to certain mysterious persons, for what purpose no one could divine. It was well known that Prussian blue is made of old leather, but the persons engaged in that business were perfectly willing to have their works inspected. After much inquiry and investigation, it was found that the old shoes were made into Jamaica rum. When they came from the rag-pickers, the good pieces were cut out and sold to small cobblers for patching purposes. The rest was distilled with spirits, colored with burned sugar and sold as Jamaica rum, and the most singular fact about the business is that it is bought, not by saloon-keepers, but by druggists who pride themselves on the purity of their articles.

## Tomato Catsup from Canning Waste.

Many industries were found in which, though the value of the product was considerable, no value was attributed to the raw material. One man who made tomato catsup acknowledged to making \$18,000 worth of catsup every year, but said that the raw material cost nothing. When pressed for an explanation, he said he sent to the factories where tomatoes are canned, big tubs, into which the peelings and trimmings of the tomatoes were thrown by the man who prepared them for canning. This material he got for the trouble of carrying it away. He ground it up, flavored it, and sold it as catsup to the extent of \$18,000 a year.

**GOOD FOR BANK PAPER.**—A French paper-maker recently tried an experiment in the manufacture of his paper, by which he introduced a sufficient amount of ultramarine green to give it a delicate green tint. After the paper was finished and lithographed like a bank draft, it was written upon with a slightly acidulated ink, the writing appearing in a clear, plain, white streak upon a light green ground. It would seemingly furnish excellent protection against tampering.

## Lead Pipes Destroyed by Mortar and Cement.

In German cities, where the streets are not decorated by festoons of telegraph wires strung upon towering masts like a dismantled forest, but securely buried in leaden pipes, the telegraphic cables are out of sight and protected from ice and fire, some interesting experience has been gained. On taking up these cables it has been found that in some places the lead pipe had become brittle and porous, and a chemical examination showed that the lead had been converted into a basic carbonate (white lead). It was found that this change had taken place only where the pipe had come in contact with mortar or cement.

Dr. Rossel, who has experimented with lead, finds that in contact with lime mortar it always loses perceptibility in weight, and in contact with cement the loss is nearly as great. Lead buried in moist earth that contains chlorides, saltpeter and sal ammoniac, lost weight, but to a much less degree than in mortar. The sulphates, like plaster of Paris and Glauber salts, had no action upon lead; neither did the carbonates, like chalk, soda and potash, nor the silicates, sand and clay. He calculates that a pipe one millimeter thick, or one twenty-fifth of an inch, might be eaten through in 15 or 16 months.

[We have ourselves seen lead pipe destroyed by holes and indentations on the outside as if bored by an insect, but were unable to ascertain the nature of the soil where it had lain.—Ed.]

From his observations Dr. Rossel makes the following statement:

1. Lead pipes should never be brought in contact with any sort of mortar or cement.
2. Clay does not attack lead pipe if free from sal ammoniac and saltpeter, the latter resulting from the decay of organic matter.
3. Plaster of Paris offers the best protection for lead pipes. Wherever lead pipes pass through a wall they should be laid in gypsum, over which mortar or cement can then be safely laid.—Scientific American.

**GENIUS, MONEY AND LABOR.**—Tennyson can take a worthless sheet of paper and by writing a poem on it make it worth \$5,000. That's genius. Mr. Vanderbilt can write fewer words on a similar sheet and make it worth \$50,000,000. That's capital. And the United States Government can take an ounce and a quarter of gold and stamp upon it an "Eagle-bird" and "Twenty Dollars." That's money. The mechanic can take the material worth \$50 and make it into a watch worth \$100. That's skill. The merchant can take an article worth 25 cents and sell it to you for \$100. That's business. A lady can purchase a comfortable bonnet for \$10, but prefers to pay \$100 for one, because it is more stylish. That's foolishness. The ditch-digger works 10 hours a day and shovels out three or four tons of earth for \$1. That's labor.

## GOOD HEALTH.

## The Growth and Development of a Child

The *Medical Record* reproduces the leading features of the studies of Prof. W. Preyer of Jena, in a field as yet quite unbroken, that is, in the psychological study of infants. This study begins, the Professor says, with the observation of the movements and sensations of a child, and then proceeds to note the developments of the different senses, the formation of speech, etc., and the effect of all these things in awakening the intelligence. The first manifestation of voluntary motion occurs about the 14th week, when the infant begins to hold up its head. After four months the head is usually balanced well, and at 10 months the power to sit up is acquired. Ability to stand was usually, in the cases studied by the Professor, gained suddenly at the end of the first year. The first grasping motion of the hand in the first quarter year are entirely reflex and mechanical, the first voluntary attempt to take hold of an object not being noticed before the 17th week. A child does not show self-consciousness, a knowledge of its independent existence, until the second quarter of the second year.

The sensibility of the skin of a new-born child is very low, and it will give no signs of discomfort if it be pricked on the nose or lips or hands. The eyes, too, close slowly when touched, and do not close at all in the bath. An increase of sensibility, however, appears in a day or two after birth. All infants are deaf at birth, because the outer ear is closed and there is as yet no air in the middle ear. A response to a strong sound is observed, at the earliest, in six hours, but often not for a day or two. The awakening of the sense may be detected by the blinking which a loud noise occasions. No other organ is thought to contribute to the intellectual development of the child so much as the ear. The first perceptions are those of light. The infant shuts its eyes as soon as the light enters them; within a week it turns its glance to the window, but it is three weeks before the eyes will follow a light moved before them.

The stupid expression on the child's face does not leave it until the second quarter year, and the face grows more human and spirited with the increase of the power of seeing intelligently.

The power to distinguish colors follows that of intelligent attention, and light and bright colors are preferred; but the power to distinguish them by name does not come until the beginning of the third year. The recognition of form, size and distance comes slowly. In the first month the infant pays no attention to the swiftest approach of the person's hand to its face, and in the third year it will still show ignorance of size and no appreciation of distance.

The Professor set down in writing every sound uttered by a child during its first two years, and which could be so represented. At first only vowels are heard, but even in the first five weeks these sounds are so diversified as to express different feelings. Thus, the Professor says, the periodically broken cry, with knit eyes, denotes hunger; the continuous whine, cold, and the high, penetrating tone, pain. The consonant m was heard in the seventh week, and in the seventh month b, d, n, v, and, rarely, g, h and k were distinguished. Imperfect imitations of sound were heard in the sixth month, and at this time voices began to be distinguished by the child. Great progress is made in the imitation of sounds after the third half year, and the powers of articulation become well developed by the fourth half year.

## The Composition of Serpents' Venom.

What a wonderful thing the venom of a serpent is! Chemical analysis fails to detect anything in it to account for its action. Water, a little albumen, some mineral salts, and traces of mucus, epithelial cells, etc., lumped together as "extractive." Nothing more—nothing specific about it at all. Tasteless, colorless, and odorless, it may be rubbed on the sound skin, or applied to the eye, or taken into the mouth without any result whatever. The bites of different kinds of snakes produce different effects; some act as a depressant to the vascular system, some as a powerful narcotic, some cause inflammation of the spine, while others seem to give rise to disorganization of the structural constituents of the blood. All are attended more or less with rigors, delirium, syncope, convulsions, paralysis, and coma. Whether the poisons of any two or more species are identical I do not know—it seems probable; but in the five species with which I have experimented on myself, so far I have found five distinct and separate venoms. I imagine, for instance, that the rattlesnake and copperhead will prove to possess the same and perhaps several of the viperine snakes. I hope so.

Some of these fluids are very unstable, and decompose if kept only a short time, or if their specific gravity is disturbed, while others retain their deadly properties even when dried. That of the common French viper (*Vipera aspis*) may be diluted down till it forms a mere local irritant. No true antidote has ever been discovered for the bite of any snake, and the search for something which shall be an antidote against the bite of all, appears to me to be irrational in the extreme, seeing that there are so many different poisons, producing, in many cases, opposite effects. One might as well expect to find a general antidote for opium, belladonna, strychnine, arsenic, and mercury poisoning. The action of ammonia, upon which so much stress has been laid, is probably nothing more than that of a strong stimulant; certainly its action in maintaining the fluidity of the blood is quite hypothetical, seeing that premature coagulation of the fibrine has never been actually demonstrated. Indeed, it is said that at the autopsy of the keeper Girling, bitten many years ago by a cobra de capello at the Gardens, the blood formed no clot at all, but was found permanently fluid in all the great vessels.—*Land and Water*.

**SALICYLIC ACID FOR BEE STINGS.**—Although salicylic acid, from having been too highly extolled, has fallen somewhat into disfavor, there can be no doubt that it is useful in the case of bee stings. An Austrian paper recommends the following treatment: First, to remove the sting as quickly as possible with a forceps or by scratching with a finger, but never between the thumb and forefinger, because this equezes more of the poison into the wound. Next squeeze the wound until a drop of blood comes out, and rub the place as large as a dollar with an aqueous or dilute alcoholic solution of salicylic acid. The effect is still better by injecting the salicylic acid into the wound with the hypodermic syringe. After this the spot is painted with collodion to keep out the air. A sting treated thus causes little or no pain, slight inflammation and swelling, and is not followed by nettle-fever or lameness in the most sensitive and nervous individuals.

The cause of malarial fever is ascribed by Messrs. Tomassi and Klebs, to the presence in the atmosphere and in the soil of an infected district, of a microscopic fungus consisting of movable shining oval spores, which they have succeeded in detecting and identifying. To test the accuracy of their observation, the fungus was injected under the skin of dogs, with the result that the animals impregnated with the poison manifested unmistakable symptoms of malarial fever, with intervals of repose for 16 hours, elevation of temperature to 107.6° Fahr., and enlargement of the spleen, in which, as well as in the lymphatic vessels, a large amount of the fungus in its characteristic form was observed. The authors propose to name this fungus *Bacillus malarie*.

## SAN FRANCISCO:

Saturday Morning, March 5, 1881.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—Concentrating Tailings; Extraction of Gold from Sulphurets, 145. Debris Misrepresentation; Trade Marks and Trade Names, 146. Design Patents; California Petroleum, 150. The West; A Gold and Silver Institute; Mining Accidents; Legislative, 152. A Glimpse of San Francisco Bay; The Williams Process; Montana Mines, 153. Patents and Inventions; Railroad Notes, 156.

**ILLUSTRATIONS.**—Emery Grinder; Appliances for Testing Ores by Chlorination, 145. View of San Francisco Looking Toward Oakland from Telegraph Hill, 153.

**MECHANICAL PROGRESS.**—Effect of a Galvanic Current Upon the Absolute Strength of Iron Wire; A New Electric Light Burner; Torion; Needle for Belt Lacing; Production of Malleable Nickel; Another "New" Locomotive; Iron Rust in Boilers, 147.

**SCIENTIFIC PROGRESS.**—Photographs in Natural Colors; The Range of the Mastodon; A Great Storm; Freezing Water Under Pressure; Circulation of Air in the St. Gothard Tunnel; The Lick Observatory Telescope; What We Think With; Artificial Vanilla; Determination of Silicic Acid in Iron; Artificial Spinol and Corundum; Strength of Insects; Mountains in the Moon, 147.

**MINING STOCK MARKET.**—Sales at the San Francisco Stock Boards; Notices of Assessments, Meetings and Dividends, 143.

**MINING SUMMARY.**—The various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 143-9.

**THE ENGINEER.**—Steam on Canals; Railroad Extension in the Mississippi Valley; Progress of the Great New York Bridge; A Great Drainage Project, 151.

**USEFUL INFORMATION.**—Oil of Coffee; Curiosities of the Census; Good for Bank Paper; Lead Pipes Destroyed by Mortar and Cement; Gemine, Money and Labor, 151.

**GOOD HEALTH.**—The Growth and Development of a Child; The Composition of Serpents' Vnom; Salicylic Acid for Bee Stings, 151.

**MISCELLANEOUS.**—Notes on the Marine Fishes of the Pacific Coast; The East has now completed its Mining Education; Bullion Product of the World, 143. The Mining Outlook in New Mexico; San Francisco Harbor; Improved Telegraphy; New Chlorination Works; Railroad Construction During 1880; Poor Mine Management, 150. The State Bag Factory at San Quentin, 154.

**NEWS IN BRIEF,** on page 156 and other pages.

## Business Announcements.

Frue Ore Concentrator—Adams & Carter, S. F.  
Pacific Business College—San Francisco.

## The Week.

The talked-of event of the week has been the final decision, by this Legislature that the debris bill shall not be repealed. This question has overshadowed all others during the session, and there has been a great deal of hard feeling engendered among the opposing factions, who have arrayed the miners and farmers against each other. For a time at least the matter is now settled and opportunity will be given to more thoroughly test the brush-dam system of impounding the debris. If it shall be found to be inadequate, there will be no difficulty next time in changing the present arrangement, while if it is successful, as hoped, a partial solution, at least, of the problem will have been made. Of course, this experiment, like all others, is an expensive one, but not out of proportion to the great interests involved.

As the days lengthen and spring approaches, the prospectors begin to think of the approaching season. Already preparations are being made by various parties to take the field in new regions. Most of the miners are looking south, but some of them have their thoughts turned northward.

The fine weather has made water plentiful in the gulches and ravines, which has been good for surface miners. The mining news from various parts of the coast show great activity. On the Comstock, however, very dull times prevail, and if no bonanzas are uncovered, they must become worse. The mining companies and the men are still engaged in discussing the miners' wages question, and in such a spirit that doubtless a satisfactory solution will soon be gained.

## A Gold and Silver Institute.

It seems somewhat strange that after over a quarter of a century's experience in gold and silver mining on this coast, we have as yet no institute, society or association devoted to the great interests of gold and silver mining. There are in the East iron and steel institutes, coal institutes, an institute of mining engineers where matters connected mainly with coal and iron mining are discussed, and similar organizations. But here we have no organization of any kind where persons of kindred interests in these subjects, are banded together for mutual benefit, improvement, instruction and advancement.

Our only mining associations are miners' unions, to keep up scales of wages. We have no place where papers on subjects connected with gold and silver mining may be read and discussed. In fact, it does not seem as if any one mining company cared anything about the progress made by any other company in those details of management or work which is to settle the question of profit or loss.

We ought to have in this city a gold and silver institute, and we hope to see one organized before long. As it is now, personal experiences are never recorded except in the ephemeral columns of the local papers, inaccessible for reference.

Among many, our gold and silver mining interests are supposed to have only a temporary place. Some are surprised that the mines have lasted so long as they have. And this opinion is strengthened by the apparent listlessness of those engaged in this class of mining to perpetuate the experience they have gained.

It was only last year that the State itself showed any interest in the matter, when it established the Mining Bureau in our midst; an institution where a fine collection of minerals is being made, and valuable information is being compiled. But the mining engineers who are among us have never taken any steps to bring about any affiliation or good fellowship. They seem to be jealous of one another, and to keep each to himself that which experience teaches him.

At one time, several years ago, a number of mining engineers and "experts" met together, after the German fashion, at one of the beer cellars in this city. Others who were asked to join the meetings thought the place unsuitable. Then it was proposed to meet at the Academy of Sciences. A section was formed and a president elected, and that was all that was ever done. There seemed to be an uncongenial feeling generated when they all got together under these auspices.

There is no reason now why the assayers, mineralogists, mining engineers, metallurgists and others of kindred branches, should not join forces and found a gold and silver institute, where matters connected with gold and silver mining could be ventilated and discussed.

The death is announced of Mr. William White, the well-known chemist and mining authority. He was the author of numerous works, including the "History of Chemistry," "Economy of Health," "Chemistry of Vegetation," "Chemistry for Students," "Hints from a Chemist," "Mineral Resources of Newfoundland," etc., and was for over half a century a constant contributor to the *London Mining Journal* and scientific literature generally. He had held at different periods lectureships on metallurgy and chemistry at various leading educational establishments, and had earned for himself a high reputation as a lecturer and writer on agricultural chemistry. He died in London at the age of 71, from a painful disease contracted while conducting experiments in his laboratory.

A COMPLETE list of beacons, buoys, towers and other day-marks, in the Twelfth Light-house District, embracing the sea coast and bays of this State, corrected up to December 21st last, has been issued from the Government printing office, and copies will be furnished to ship masters free, at the Lighthouse Inspector's office, No. 120 Sutter street.

EASTERN wood workers are beginning to inquire after Nevada mountain mahogany. It is a heavy, fine-grained wood, which is susceptible of receiving a high polish, but all efforts to utilize it in the cabinet-maker's art have thus far proved fruitless, because nothing can be done to prevent its checking.

ARIZONA resembles most mining regions in being overcrowded with men who have no money and find it difficult to make a living. There are reported to be fully 2,000 persons in Tucson and Tombstone unemployed, who are living from hand to mouth, as best they can.

AMERICAN geologists are asked to compete for the prize of \$1,000 to be given at the approaching International Congress of Geologists at Bologna, for the best international scale of colors and conventional signs, for graphic representation of formations on geographical maps and sections.

LITTLE COTTONWOOD, Utah, it is expected will come to the front again this season, and resume its former position as a prosperous mining center.

## Mining Accidents.

John Hughes has brought suit against the San Francisco copper mining company to recover \$5,000 for alleged personal damages. It appears from the complaint that on the 10th of August, 1880, plaintiff was employed by defendants in the capacity of engineer of the mine of the company, and that, while in the discharge of his duties, the foundation of the hoisting works and the engines and machinery connected therewith all fell in, whereby plaintiff's right arm was considerably fractured, his right shoulder-blade was dislocated and his right collar-bone was greatly injured. He claims that the accident was the result of sheer negligence on the part of the defendants, and could easily have been averted by the exercise of a reasonable amount of vigilance. Since the above accident the plaintiff has been unable to work on account of the injuries he then sustained.

At Belmont, Montana, on the 16th ult., a fire occurred in the Belmont mine and six men burned to death. The blacksmith shop caught fire and communicated to a magazine of Hercules powder which exploded. The shaft caught fire and although two men escaped, the other five in the mine were burned.

At noon on the 24th ult., a miner named John Retallic, in the Zule mine, Amador county, was blown up and killed. It is customary to explode blasts just before the dinner hour, so that the smoke will be cleared away by the time the miners are through with lunch. On the morning named, deceased and a fellow worker named Frank Spinetti, prepared four charges, and lighted the fuses, Retallic lighted three, and Spinetti setting fire to the fourth. They then retired to a safe distance and awaited the explosion. Two minutes elapsed, and three explosions were heard. Deceased then asked Spinetti if he had lighted the fuse; to which the latter replied, "Yes; but I don't think it has gone off." All the holes were charged with giant powder, but the fuse of one charge was somewhat longer than the others. Deceased had charge of the blasting operations, and impatient probably at the delay, went forward to ascertain the cause. Safety requires that at least five minutes should be allowed to elapse before venturing near an unexploded cartridge. This length of time, however, was not allowed to transpire in this case. On reaching the fatal spot, Retallic remarked, "The three charges have done first-rate." These were his last words. A few seconds later, and the dilatory charge went off killing him and injuring his companion.

On the 22d ult., Theodore Fleitz, working in Lindermer & Hottinger's hydraulic claim at Quaker Hill, Nevada Co., saw a boulder weighing six or eight tons in the act of falling from the bank. He gave the alarm so that the other miners got out of the way, but before he could escape the mass fell, grazing him and breaking his shoulder and arm.

Henry F. Bullerman, a young man employed at the Sargent & Jacobs drift mine as brakesman, was the victim of a terrible accident, last week. The Nevada Transcript says that he reached through the slowly revolving iron wheel with his right hand to oil some of the machinery, when one of the spokes struck his arm—the right one—pressing it against the pump-bob with such force as to cut it almost entirely in two just above the elbow. He called for assistance, but no one heard him. He then raised the cage a few feet from the bottom of the shaft several times and let it drop again, hoping by this means to attract the attention of the men underground, but not until he had stopped the pumping machinery did they apprehend anything wrong, whereupon they went to the surface by means of the ladder and there found Bullerman in an exhausted condition. He was removed and it was found necessary to amputate the arm.

An accident occurred in the Baker mine, Placer county, last week, says the Placer Times, by which Cris. Helmkamp, one of the men employed in the mine, had his ankle badly broken and fractured. New blocking is being put in the flume in the tunnel and are being let down the shaft at the head of the tunnel by means of the derrick. On that particular occasion a lot of eight or nine blocks were chained together and were being let down when the chain slipped letting one of the heavy blocks fall down the shaft, 90 ft. deep. When it struck the bottom the block glanced off from another block and struck Mr. Helmkamp, about 20 ft. down the tunnel, crushing the bones of the ankle in a frightful manner.

GEORGE DALY.—The Leadville Democrat of February 18th says, in reference to the disturbance at the Robinson mining camp, that at three o'clock on the morning of the 17th an order came to Leadville from George Daly, by telegraph, for arms. Two cases of Winchester rifles and 2,500 rounds of ammunition were sent him. The morning of the 18th, at one o'clock, the Democrat received a special dispatch as follows: "All is quiet at Robinson and the authority of the Sheriff is acknowledged by both factions. George Daly has been warned to leave the camp, but Daly is not the man to obey such orders, and when there is any attempt to enforce such an order there will be a big disturbance."

THE new cable for the Chollar-Norcross-Sage shaft, on the Comstock, weighs 15,000 lbs.

## Legislative.

By the time this number of the PRESS is in the hands of its readers the Legislature will have adjourned, leaving a very large amount of business unfinished. The bill of the session, however, and which occasions the delay was finally considered. It is too bad it was not considered before, and other necessary measures attended to. However, the "debris" question is finally settled for a time at least.

Mr. Harlan tried to get Senate bill No. 319, to prevent the streams, rivers and bays of the State from filling up with debris from the hydraulic mines, referred to the Swamp Land Committee. This was refused.

The event of this week and of the session was the final consideration of Senate bill No. 27, to repeal the debris act. After the usual debate the roll was called, the issue being, "Shall the bill be read the first time?" with the following result:

Ayes—Alviso, Birney, Bost, Branch, Camron, Crank, Crumpton, Cunningham, Del Valle, Estey, Felton, Gay, Griffith, Hartson, Hendrick, Hinchshaw, Holden, Kilburn, Leach, Lsake, Matthews, of Tehama, Matthews, of San Benito, McMurray, Murphy, Patterson, of San Joaquin, Paulk, Platt, Reynolds, Samuels, Sargent, Siebe, Streeter, Wason, of Ventura, Werstbaugher, Whipple—35.

Noes—Arick, Brown, Burns, Chandler, Coleman, Daggett, Edwards, Fraser, Freer, Garrity, Gavigan, Geary, Gilmore, Hale, Hoyt, Howard, Jackson, Kesting, Kellogg, Lsne, Lewis, Long, May, McCallion, McClure, McDonald, Mein, Mudgett, Noonan, O'Connor, Paterson, of Nevada, Pinder, Reddick, Swift, Van Fleet, Warkins, Wason, of Mono, Wood, Young—39.

The bill was accordingly refused a first reading. The Committee on Federal Relations reported back A. C. R. 24, relative to asking the Federal Congress for an appropriation of \$20,000, to remove obstructions to navigation at the mouth of Smith river in Del Norte county, recommending its adoption; A. C. R. 23, for an appropriation of \$500,000, to secure our rivers and harbors against the damage by debris, recommending its adoption.

Watson, from the Prison Committee, reported favorably on Ssars' bill appropriating \$219,000 for the purchase of jute, jute machinery, lands, erection of buildings at San Quentin for the manufacture of jute.

Sears explained that the machinery and jute had been purchased and was now in San Francisco. The credit of the State had been pledged for its payment. This measure is necessary in order to provide employment for 1,500 convicts. He asked the suspension of the constitutional provision and the passage of the bill as an urgent necessity. Watson said the Constitution abolishes the contract system of prison labor. The contracts have expired and the prisoners are idle. The jute machinery alone cost \$100,000. It will cost \$25,000 for engines to run the looms. The Directors propose to buy of contractors the wood work machinery at a cost of \$10,000. The Directors purchased 50 acres of clay land, paying \$300 an acre. This was for a brickyard. The Directors have purchased \$40,000 worth of jute. The profits of the brick already made are more than the land cost. The Directors believe they can make the prison self-sustaining with this amount of money invested in jute, leather and wood-working machinery.

On a vote being taken the bill was finally passed.

Assembly bill No. 431, providing for a proper representation of California products at the World's Fair, to be held in New York in 1883, was finally passed.

Senate concurrent resolutions, relative to transferring the minerals at the State Library to the State Mining Bureau in San Francisco, were adopted.

SMELTING FURNACES.—The copper furnace now in course of construction for the Pinal company, in the Mineral Creek district, was built by Messrs. Rankin, Brayton & Co., of the Pacific Iron Works, San Francisco. This firm first introduced the water jacket in the construction of smelting furnaces, which have proved so successful in the reduction of copper and galena ores, and which are now in almost universal use in all parts of the country. No other invention has contributed so much to the development of this important interest. The cost of construction and running expenses are greatly reduced by this method of smelting. This firm have had a large experience in general mining machinery, as well as in this special line of work, having made, with few exceptions, all the smelting furnaces in use on this coast. Parties desiring to put up works of this character can, therefore, depend upon getting from these works the latest improvements applying to this process and machinery that will give the best possible results in any class of ore.—Globe Chronicle.

CHLORIDING is likely to again become a prominent feature of the mining industry in Silver Reef, and work has already commenced on several claims on the East reef. The charges for milling are somewhat lower than they have been heretofore, and should the rich streaks only come in big enough the boys will be able to make wages at it.

## A Glimpse of San Francisco Bay.

We give upon this page an engraving of such a glimpse of San Francisco bay as one might gain by standing on the crest of Telegraph hill and looking toward the city of Oakland. There is but a small portion of the bay included in the view, for San Francisco bay is a grand sheet of water, stretching from north to south about 60 miles, and having an area of 480 square miles. And yet our view includes some of the points of chief interest in connection with our commerce and passenger traffic. The outgoing and incoming ships which are seen are plying upon the channel which constitutes the harbor proper. Within the area embraced in this view the wheat fleet anchors, and across this water ply the steamers which go up and down the coast and across the Pacific ocean. The large island a little to the left of the center of the picture is Goat island, which won national fame by the congressional contention of which it was the bone, several years ago. Just to the right of Goat island and about a mile to the eastward are the wharves of the Central Pacific

## The Williams Process.

In our last issue we gave a description of a new process for desulphurizing ores by means of a peculiar method of applying the fuel. We were not then aware that the process was at work here. Since writing the article we have received from Mr. H. O. Lang, Sonoma, Tuolumne county, some impressions of the same invention, which he tells us has attracted great attention there. We append Mr. Lang's letter, which speaks for itself:

Latest among the unnumbered so-called processes for gold extraction which have attracted more or less attention, and have been successful in a greater or less degree in approaching the standard of excellence claimed, often injudiciously, by their inventors or proprietors, is found that process or invention whose name heads this article. It is proposed in the following to give a plain account of the furnace which is the subject of the Williams patent, and to endeavor to describe its mode of working suffi-

ciently to indicate whether it is likely to prove an important adjunct to the metallurgical processes of the day.

It is to be borne in mind that the sole function of the furnace is the roasting of sulphureted ores; and this roasting is claimed to be done more thoroughly and expeditiously than in any other furnace. It consists essentially of a modified blast furnace like those used for the manufacture of iron, but of smaller dimensions, and while preserving a similar inward contour, is provided with a hearth near the bottom; which hearth is horizontal, is made of cast-iron of a suitable thickness, and is perforated with a large number of small holes which form the only communication between the main upper part and an otherwise air-tight lower portion. By means of a blast pan or other suitable contrivance, whose description is not essential to this account, a supply of air is forced into this lower air-tight space, and rising, enters the charge which has been allowed to drop through a charging-door suitably placed. Of course, an amount of fuel is necessary; and herein consists a peculiarity of the invention. Heat-making ingredients are supplied in the shape of asphaltum and sawdust, which are mixed with the ore in the just proportions by means of a stirrer provided with radial arms which thoroughly incorporate the melted hydro-carbon with the other materials. The salient points, then, of the invention are these:

The perforated hearth to distribute the air currents, the employment of an artificial blast, and of sawdust and asphaltum as fuel. It would seem that these features are not separately new, but have been applied to furnaces which antedate this one by many years. The inquiry is not, how-

ever, into the priority of invention, but rather into the efficacy of the system.

To the practiced and scientific furnacemen of this day, it would come home forcibly that this furnace with its singular fuel must be the invention of some theorist, or the chance development of some clerk or mechanic without previous experience or knowledge of the art of roasting; and accordingly we are told that it was the accidental invention of an individual, whose occupation was laying down asphaltum sidewalks. But however fortuitously the invention came about, there are good reasons for considering the choice of combustibles an excellent one. As compared with charcoal, mineral coal or coke, we find asphaltum, and more particularly sawdust, to be a fuel of light specific gravity, creating comparatively little heat, and, above all, giving out when burned with an insufficient supply of air, a large amount of hydrogen, a gas to the remarkable desulphurizing powers of which, the process must be largely indebted for whatever of success it may achieve.

It may here be necessary to remind the unpracticed reader that in metallurgical operations of this sort, it is a great desideratum to keep

## Montana Mines.

In the early days of Montana, when her rich placers were being worked, and the miners were making fortunes, she attracted great attention. When most of these placers were exhausted the Territory began to drop back as a mining country. For a long time the quartz mines attracted comparatively little attention, but within the past two years, and this past year

VIEW OF SAN FRANCISCO BAY LOOKING TOWARD OAKLAND FROM TELEGRAPH HILL.

railway, where the hosts of travelers from the interior and the East take to the ferry boats to reach San Francisco. From these wharves also come to the city the thousands of people who find homes in Oakland and her sister cities on the east shore of the bay. At this point also is the solid pier, about two miles long, just finished, and upon which new ferry buildings will soon be erected, and this solid structure will soon bear the traffic which now goes over the old arrangement of piles and planks. Farther to the right lies the entrance to San Antonio creek, the avenue of travel lying between parallel sea walls a little more than two miles in length. This gives another means of access to Oakland and to Alameda, another beautiful city lying in the offing at the extreme right of the engraving. To the left of Goat island and nestling under the distant hills beyond the water, lies Berkeley with its State University and asylum for the deaf, dumb and blind. From the center of the engraving to the right the bay stretches southward about 30 miles between the counties of Alameda and San Mateo; and to the left, the bay extends northward nearly the same distance, its waters laving the shores of Marin, Sonoma, Napa, Solano and Contra Costa counties.

The Wood river excitement continues all over Nevada, Utah, Montana and throughout the East. It is thought that at least 10,000 people will go there as soon as spring opens.

TUESDAY evening at 6 o'clock a blast of 24,000 lbs. of Judson powder, was set off in the American mining company's claim at Sebastopol, one mile west of North San Juan.

ciently to indicate whether it is likely to prove an important adjunct to the metallurgical processes of the day.

It is to be borne in mind that the sole function of the furnace is the roasting of sulphureted ores; and this roasting is claimed to be done more thoroughly and expeditiously than in any other furnace. It consists essentially of a modified blast furnace like those used for the manufacture of iron, but of smaller dimensions, and while preserving a similar inward contour, is provided with a hearth near the bottom; which hearth is horizontal, is made of cast-iron of a suitable thickness, and is perforated with a large number of small holes which form the only communication between the main upper part and an otherwise air-tight lower portion. By means of a blast pan or other suitable contrivance, whose description is not essential to this account, a supply of air is forced into this lower air-tight space, and rising, enters the charge which has been allowed to drop through a charging-door suitably placed. Of course, an amount of fuel is necessary; and herein consists a peculiarity of the invention. Heat-making ingredients are supplied in the shape of asphaltum and sawdust, which are mixed with the ore in the just proportions by means of a stirrer provided with radial arms which thoroughly incorporate the melted hydro-carbon with the other materials. The salient points, then, of the invention are these:

The perforated hearth to distribute the air currents, the employment of an artificial blast, and of sawdust and asphaltum as fuel. It would seem that these features are not separately new, but have been applied to furnaces which antedate this one by many years. The inquiry is not, how-

the temperature so low as not to be in danger of fusing the sulphides before they are reduced, in the copper, should it occur. Melting would in either case be disastrous to the results of the roasting for obvious reasons. Too copious a supply of air, from its tendency to elevate the temperature of the ore, and on the other hand, consuming the fuel without producing the requisites reducing effect must be deprecated. This is a point probably not fully understood as yet by the men who have had charge of the operations. The furnace is seriously open to criticism in the important point of duration of the desulphurizing process. It is apparent that combustibles of the nature of those employed would speedily be consumed, and with their extinction, the desulphurization must also end, for whether the sulphur be consumed with air, passing off as sulphurous acid, or partially converted into sulphuric acid, or whether it combine with hydrogen, producing the well-known sulphureted hydrogen, it requires time and an elevated temperature to thoroughly effect the chemical decompositions. The unmanageableness of the combustion, which should extend into all parts of the mass, and not be confined to its outer surface, may be counted as another objection; and finally the necessity of considerable scientific knowledge and professional skill on the part of the operators may act as an obstacle to the successful employment of this mode of roasting.

It would be wrong at this point, however, to predict a failure to the process, because, so far, none of the essentials to success have been complied with. Because the works in Tuolumne county have been obliged to discontinue operations, it does not follow that under a more ca-

particularly, the Territory is again coming to the front as a bullion producer. The mining people there are sanguine of their future, as will be seen by the following paragraph from the *Butte Miner*:

Our Montana mines are, each year, developing into valuable properties. This Territory is looming forward prominently as the mining center of the United States, and the Butte mines are steadily gaining a national reputation for wealth and permanence. The large amount of capital expended in opening and developing the mines in the Summit Valley district is money spent that will return compounded. There is now more encouragement for mine owners than ever before to open and develop their mines, either for the purpose of effecting sales, or for the object of profitably operating and working their properties. The facilities for working the mines are better than formerly, and the use of modern machinery economizes the operations of all kinds of mining enterprises very materially. Soon we will be in direct railroad connection with all parts of the country, and that will not only cheapen the cost of supplies, but it will bring to our camps and mining districts hundreds of men representing and offering for investment millions of dollars now awaiting opportunities for investing. Thousands of men, without capital, perhaps, but with willing muscle, will come to our camps, where the lucky poor man stands on an equal footing and takes equal chances with the most fortunate operator. Our mines are now only in their incipient stages of development, when compared with what they are bound to be just as soon as their value is made known throughout the country.

## The State Bag Factory at San Quentin.

The mooted manufacture of jute bags by the State, employing the convict labor at San Quentin prison, has naturally excited no little interest among bag consumers. The interest seems to be twofold—first, through the hope of getting cheaper bags; second, the chance of sale for such jute as our farmers might grow, and thus the State might eventually become self-supporting in the matter of bags instead of exporting millions of dollars for these materials. The machinery for setting up at the prison is now on the way to this port, and a bill is now before the Legislature to appropriate money to pay for it. Other facts about the enterprise are given in the 1880 report of the Prison Directors to the Governor, as follows:

Acting upon the suggestion contained in your Excellency's inaugural address, respecting the manufacture of jute bags, the Board, after making an exhaustive examination of the whole subject, determined to establish the enterprise, and for the following reasons, viz.: the enormous demand for these goods by the farmers of this State; the larger portion of their value being in the labor necessary for their production, it will afford constant and remunerative employment to nearly or quite 500 convicts, many of whom might be physically incapacitated for the hard labor required in other branches of industry, and especially because of its non-competition with free white labor, and of the unqualified endorsement it has received from leading farmers and other business men of the State.

Of the many manufacturing interests, which we have investigated, this seems the most feasible, the most likely to be successful and the best adapted to the wants of our State.

Accordingly, on the 21st day of August last, we entered into a contract with Messrs. Fairbairn, Kennedy & Naylor, of Leeds, England, through their authorized agent, John E. Stevens, for the purchase of 100 looms, and the other necessary machinery required in the manufacture of hurlaps, twine and jute bags, to be shipped from Liverpool on or before the first day of December, 1880. The cost of the machinery laid down in San Francisco, including tariff, freight and insurance, will be \$96,000, or to cover all contingencies say \$100,000. The Board expect the factory to be in operation about the 1st of May next; such at least is their earnest desire. That there may be no delay in beginning operations on the completion of the factory, an order was given in October last to Messrs. Degener & Co., of San Francisco, for 250 tons of jute, to be shipped immediately from Calcutta. Another order was also given to Messrs. Balfour, Guthrie & Co., for 250 tons, to be shipped at a later date.

In this connection we may remark that to induce the raising of jute we have ordered a quantity of jute seed for distribution among the farmers who wish to experiment in its cultivation.

## Business Directory.

WM. BARTLING. HENRY KIMBALL

BARTLING &amp; KIMBALL,

BOOKBINDERS,

Paper Rulers &amp; Blank Book Manufacturers

505 Clay Street, (southwest corner Sansome),

SAN FRANCISCO.

Agent for PADDOCK'S Ore Dressing Machinery.

Mining Machinery supplied.

## San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS &amp; CO.,

611 and 613 Front Street, San Francisco

CALIFORNIA  
Electric Light Company.

Owners of the Brush System of Electric Lighting for the Pacific Coast.

Apparatus for sale for Mines, Mills, Manufactories, etc. Plating Machines and Machines for treating Ore manufactured to order.

Electric Light furnished on all the principal streets of the city.

Office—No. 119 O'Farrell Street,  
SAN FRANCISCO, CAL.

## The Explorers' and Assayers' Companion,

By J. S. PHILLIPS, M. E.

(Third edition.) Price of Vol. 1, \$3.

Forwarded (post-paid) from the MINING AND SCIENTIFIC PRESS Office, by DEWEY &amp; CO.

## MOREY &amp; SPERRY,

MANUFACTURERS OF

## Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one per hour of hard quartz that will pass through a 40-mesh screen. The wear is less in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charge or continuous. It will amalgamate either gold or silver ore, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply Iron Work complete for Wood Frames, also

SPERRY'S  
WROUGHT IRON FRAME  
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY &amp; SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

PACIFIC MACHINERY DEPOT.

Scientific and Practical Books  
on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY &amp; CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

## MECHANICS' MILLS.

OUR WELL KNOWN

WATER TANKS,

Made by machinery, constantly on hand and made to order. PAN STAVES, WOOD PULLIES and OAK GUIDES a specialty.

WELLS, RUSSELL &amp; CO.,

Mechanics' Mills, corner Mission and Fremont street.

## LEACHING

## Gold and Silver Ores,

By C. H. AARON.

The most complete Hand-book on the subject extant, 164 pages octavo.

Illustrated by 12 Lithographic Engravings and Four Woodcut work.

Fully indexed. Plainly written for practical men.

In cloth, \$3.00. Sold by

A. J. LEARY, Stationer,

402 &amp; 404 Sansome Street, San Francisco.

Send for Circular.

A Card from Architects.

The California Architect and  
Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:  
Believing that a journal of this kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huene, John Marquis, B. McDougal & Son, Wm. Mosser, Wm. Curlett, Meeker & Banks, W. O. Hogland, S. & J. Newman, B. Hennickson

FRANCIS SMITH & CO.,

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.  
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimate given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphalturn.

Office and Manufactory, 130 Beale Street, San Francisco.

ASBESTOS.

CONSTANTLY ON HAND

Asbestos { Board 1-32 Inch to 1-4 Inch Thickness.  
{ Sheathing 1-64 and 1-32 Inch Thickness.  
{ Packing 1-4 Inch to 1 1-2 Inch Diameter.  
{ Yarn for Valve Stems, Etc. } Asbestos.

ESTIMATES GIVEN FOR COVERING BOILERS, DRUMS, STEAM PIPES, Etc.

The Largest Stock on the Pacific Coast.

B. S. HILL, Agent, Nos. 317, 319, and 321 Mission Street, San Francisco.

GOLD MINERS

WORKING PLACER, GRAVEL AND QUARTZ MINES,  
SAVE YOUR GOLD!  
- BY USING -  
SILVER PLATED AMALGAMATING PLATES.

The most economical and successful process now in use. Will warrant my Plates to save a very much larger percentage of gold than any other method.

SWING AND RIFFLE PLATES for Saving Float Gold Made to Order.  
OLD MINING PLATES BOUGHT, TAKEN IN EXCHANGE FOR NEW, OR RE-PLATED.  
ALL KINDS OF METAL GOODS PLATED!

San Francisco Gold, Silver and Nickel Plating Works,  
663 and 665 Mission St., bet. New Montgomery and Third, San Francisco.

Send for Circular. EDWARD G. DENNISTON, PROPRIETOR.

Awarded First Premium at Every Fair of the Mechanics' Institute for the Last Twelve Years.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequalled strength, toughness and durability.  
An invaluable substitute for forgings or cast-iron requiring three-fold strength.  
Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.  
15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.  
CRANK SHAFTS, SHOES, DIES and GEARING specialties.  
Circulars and Price Lists free. Address

## PATENTS AND INVENTIONS.

### List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

FOR THE WEEK ENDING FEBRUARY 16TH, 1881.  
9,564.—MATTREES FRAME—Reissue—R. E. Campbell, S. F.  
237,813.—GRIP—H. Cosebolt, S. F.  
237,814.—CABLE RAILWAY—H. Cosebolt, S. F.  
237,851.—WINDMILL—E. Fasket, San Jose, Cal.  
237,908.—NEEDLE—H. Royer, S. F.  
237,921.—GRINDING PAN.—Steiger & Kerr, S. F.  
237,927.—HEADER WAGON—Tayntou & Derrickeon, Olavton, Cal.  
237,934.—DRAW BAR—A. H. Weir, Los Angeles, Cal.  
237,942.—GUN—A. H. Woolsey, Gilroy, Cal.  
237,859.—POTATO DIGGER—F. McLeilen, White River, W. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### Railroad Notes.

The Oregon Railway & Navigation Company are vigorously pushing work along their line beyond Dalles. A very large force of men are engaged, and great activity is everywhere displayed.

An immense transfer boat is being built at Celilo, to transfer the cars of the N. P. R. R. across Snake river at Ainsworth. The boat will be 200 ft. long, 36 ft. beam and 7 ft. hold. It will be ready for service by the first of May. Two very large boats are also in course of construction at Dalles. Vice-President Oakes has made a requisition for 30 more locomotives from the East, which, including two now on the way, makes 32 to be expected. With a reasonable amount of good luck, trains will be running clear through to Walla Walla in less than 40 days from date.

The section of the Sacramento and Placerville railroad, running from Folsom to Shingle Springs (26½ miles), has been placed in the hands of a receiver, and all the rolling stock has been withdrawn. The road was once before sold by a receiver and bought by the Central Pacific railroad, but old claims have appeared. The road has never paid, it is said, and there are doubts if it will be opened again for a long time.

The Bodie Railway company has been organized to build a narrow gauge railway from Bodie to the timber tracts lying southwest of Mono lake. The road will be exclusively for freight and will not be more than 40 miles long. The tract of land is situated in township 1, south of ranges 27 and 28, east of Mount Diablo base and meridian. The Directors are H. N. Yerrington, A. J. Ralston, R. N. Graves, W. S. Wood, William Willis, J. B. Low and J. M. Quay, and Seth and Dan Cook are among the stockholders. R. N. Graves is President; A. J. Ralston, Vice-President, and William Willis Secretary and Treasurer. The road will greatly facilitate the development of a great gold-bearing section in the main range of the Sierra Nevada and will confer special advantages upon the Homer mining district. Eventually the road will be of great service to tourists and others, who desire to view the picturesque scenery west of Mono lake.

The Chicago Times says that the losses entailed upon the principal Western roads by the snow blockades will more than equal the net earnings of those lines for January and February. Nearly 1,000 miles of road operated by the Chicago, Milwaukee and St. Paul company, in Minnesota and Dakota, have practically been blockaded all winter.

The tracklayers of the Carson & Colorado railroad, says the Dayton Times, resumed work at the front last Sunday morning. Since then ten miles of track have been laid. This is at the rate of about a mile and a half per day. It is the intention of Mr. Lawes, the superintendent of construction, to not only keep up this rate of progress, but to increase it to two miles per day as soon as the Walker Lake Reservation house is reached.

The locomotives of this road are of exceptional strength. They haul as big average loads as broad-gauge locomotives, the usual load being 20 cars loaded with ties, rails, fish-plates, spikes, etc. This, the train hands say, is fully as much as could be hauled on any broad-gauge having as steep grades as those on the Carson & Colorado. The loads now aggregate about 125 tons, besides the weight of the cars; but when the cars have run a while, the train hands say, the locomotives can haul loads of 150 tons with comparative ease.

All the breaks made in the track during the recent storms have been repaired in the most substantial manner.

The railroad will be completed to Hawthorne sometime in April.

The road is now in running order for 55 miles from the Mound House.

One train runs each way daily, from the Mound House to the end of the track. Although the road is not open for traffic this, train hauls to the Stinking Wells, Wahuska and Walker river whatever freight is urgently required at those places, or at the copper mines west of Mason valley.

### News in Brief.

MONTANA cattle shipments doubled last year. Three whales were caught at San Simeons, last week.

COWBOYS are carrying off cattle from the New Mexican herds.

FOUR men were drowned in the Columbia river by the collision of the steamer Oregon, with a river steamer and barge.

LEE WARDEN killed himself near Oleta, Amador county, by jumping into a mining shaft.

WHITELAW REID, editor of the N. Y. Tribune, is to be married to a daughter of D. O. Mills.

A WASHINGTON dispatch says: The United States currency outstanding at this date is \$362,585,258.

PEOPLE desiring to go to Wood river will get there in good season by starting on or about the 1st of April.

THE losses by fire and robbery during the riot in Lima and Callao are estimated at \$6,000,000.

D. O. MILLS, formerly of this State, bought property valued at \$1,500,000 in New York last month.

THE coinage for February at the United States mint at Philadelphia was 4,278,660 pieces, valued at \$6,320,900.

THE French Government asks for a man-of-war to watch the Tahiti islands and additional ships for Chinese waters.

THE North Star hoisting works, at Austin, Nev., belonging to the Manhattan Mining Co., was destroyed by fire Feb. 23d.

ELIZABETH W. BONJETTI committed suicide Feb. 21st, near Saratoga, Santa Clara county, by cutting her throat with a razor.

GENERAL amnesty for all persons implicated in or condemned for political offenses will be proposed by the Spanish Ministry.

THE Boers, instead of being subdued, have had a fight with the British forces and killed Gen. Colley, 22 officers and 627 men.

CARLYLE has bequeathed his Dumfriesshire estates to the University of Edinburgh for founding Bursaries in the Faculty of Arts.

THE Catholic Orphan asylum at Scranton, Penn., was burned on the night of Feb. 20th, and 17 children perished in the flames.

EDISON has moved from Menlo Park to No. 65 Fifth avenue, New York, where the officers of the Electric Light Company will be established.

THE N. P. R. R. company have withdrawn their lands from the market in the Walla Walla valley, W. T., intending to reorganize their land department.

THE Minnesota Capitol caught fire while the Legislature was in session and burned to the ground. Loss \$100,000, in addition to the valuable libraries.

ACCORDING to a decision just rendered by the United States Circuit Court at Chicago, a Chinaman cannot become a naturalized citizen of the United States.

GEORGE STEPHENS, President of the Canada Pacific Railway Syndicate, has sailed for London to obtain \$10,000,000 on bonds, with which to prosecute this work.

BANK COMMISSIONERS Coleman and Watt examined the Nevada Bank of San Francisco on the 26th ult. and found it solvent, with assets and liabilities amounting to \$12,937,061.79.

MOST of the stock brought to Antioch from the flooded islands will remain during the spring and summer months, but that coming from Yolo county has been mostly returned.

THE total expenditures since the S. F. Library was opened have been \$66,263 \$6, and receipts \$95,597.93, leaving an available balance of \$29,334.07. There are 22,746 books in the library.

HEARNE, land agent to the brother of the late Lord Mountmorris, has been fired at by two men near his residence at Ballinrohe, Ireland, and mortally wounded. He received six pistol shots.

THE counties of Alameda, Santa Clara, San Joaquin, Merced, San Diego, Contra Costa and other counties interested in the R. R. tax suits, will join issues and make a single test case, thus lessening the expense to all.

WILLOW RANCH, eight miles south of the State line in Modoc county, had a heavy set-back in November, by the burning of the Snider Mill, with about 6,000 bushels of wheat; total loss, \$16,000 to \$18,000; insurance, \$10,000.

THE recruiting rendezvous of the United States regular army at San Francisco has been closed for the present. Discharged soldiers, with excellent characters, will be re-enlisted and sent to the companies they desire to join. None others need apply. It is further learned that recruiting for the regular army in the Eastern States is sufficient to fill all expiring vacancies from these sources.

THE Salt Lake Tribune says: Salt Lake is on the eve of a great boom. Several new railroads are soon to center here, the Street Railway Company are extending their line, the Electric Light, Power and Heating Company's works are nearing completion, the Telephone Company is stretching its wires and opening its exchange, large business blocks are contemplated, and dwelling houses innumerable.

AT noon, Feb. 22d, 18 deep-water vessels of from 1,200 to 1,500 tons register entered this port, in addition to coasting vessels and steamers, presenting a scene which has not been witnessed before since 1860, according to the records of the Merchants' Exchange. The majority of the vessels hailed from Eastern and foreign ports, and are under charter to load wheat stored along the city front. Those that were not already chartered for that purpose, it is understood will be in a short time.

## For \$1.

We want 5,000 new subscribers during 1881, and shall make all reasonable efforts to secure them.

To induce new readers to try our paper, we offer to send the PACIFIC RURAL PRESS three months (thirteen weeks), with either of the following premiums, for ONE DOLLAR:

1. One dollar's worth of flower and garden seeds, postage paid, according to schedule and prices elsewhere noted.

2. One of Dewey's Newspaper Binders (elastic with cloth-covered sides, size of RURAL PRESS) for holding papers in book-form.

3. "Pacific Rural Hand-Book" on California Horticulture, Floriculture, and Gardening, in cloth binding with gilt title.

4. The "American Beekeepers' Guide," a complete manual and reference book on all subjects connected with bee culture, in cloth binding.

5. A pair of fine French Chromos, each 11x15 inches; one "A Gleeful Boy at Dinner," the other "Caught Napping."

6. Two Photo-Engraved copies of fine steel-plate engravings ("Hunting" and "Fishing"), each 18x24 inches.

7. "Ropp's Easy Calculator," containing many convenient tables for showing the value of grain, timber, coal, and all other kinds of merchandise; bound in cloth.

8. Thirteen assorted card Nos. of the RURAL PRESS.

N. B.—For \$3.50 (THREE DOLLARS AND HALF) we will send the RURAL PRESS one year, and two of either of the above numbered premiums. Old subscribers who are paid up to date, or beyond, can make further remittances on the same terms as above offered to new subscribers.

DEWEY & CO., Publishers,  
No. 202 Sansome Street, San Francisco, Cal.

### Plant Gardens! Plant Flowers!

Extra Inducements for New Subscriptions.

There should be more gardens planted on this Coast. It would add pleasure and health to many, and enhance the value and attraction of their homesteads. To encourage the planting of seeds, and to extend the circulation of the PACIFIC RURAL PRESS, we will offer, while this notice remains in our columns, to furnish to all old or new subscribers, the following seeds on the favorable terms named below:

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. OSBORNE—San Francisco.  
A. C. KNOX—Pacific Coast.  
G. W. McGRATH—Santa Clara county.  
M. F. OWEN—Santa Cruz county.  
J. W. A. WARD—Merced, Tulare and Kern counties.  
N. E. BOYD—San Bernardino Co.  
JARED C. HOAG—California.  
B. W. OROWELL—Colusa and Yolo counties.  
D. W. KELLEHER—Fresno, San Benito, Monterey and San Luis Obispo counties.

### Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St. S. F.

## The Californian.

THE RISING MONTHLY OF THE DAY. YEARLY SUBSCRIPTION \$4. Single number 35 cents. AGENTS WANTED in every town and village of the United States to canvass for this popular magazine. The most liberal commissions will be paid to responsible parties. This is a chance to make money at your own home. Address THE CALIFORNIA PUBLISHING CO. (P. O. Box 3219) 202 Sansome St. S. F.

### By Universal Accord,

AYER'S CATNATHR PILLS are the best of all purgatives for family use. They are the product of long, laborious and successful chemical investigation, and their extensive use, by physicians in their practice, and by all civilized nations, proves them the best and most effectual purgative Pill that medical science can devise. Being purely vegetable, no harm can arise from their use. In intrinsic value and curative powers no other Pills can be compared with them, and every person, knowing their virtues, will employ them, when needed. They keep the system in perfect order, and maintain in healthy action the whole machinery of life. Mild, searching and effectual, they are specially adapted to the needs of the digestive apparatus, derangements of which they prevent and cure, if timely taken. They are the best and safest physic to employ for children and weakened constitutions, where a mild but effectual cathartic is required.

### FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive Dewey & Co.'s MINING AND SCIENTIFIC PRESS PATENT ANNUAL Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

## DIVIDEND NOTICE.

OFFICE OF THE

## Eureka Consolidated Mining Company,

Nevada Block, room No. 37, San Francisco, February 15th, 1881.—At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 64) of Fifty (50) Cents per share was declared, payable on Monday, February Twenty-first (21), 1881, for the purpose of electing a Board of Directors to serve for the ensuing year, and for the transaction of such other business as may be presented. Transfer books will close on Friday, February Twenty-fifth (25), 1881, at the hour of 12 M. J. W. PEW, Sec'y.

## ANNUAL MEETING.

The regular Annual Meeting of the Stockholders of the Peytona Gold and Silver Mining Company will be held at the office of the Company, No. 310 Pine Street, Room 15, San Francisco, California, on Monday, the Twenty-eighth (28) day of February, 1881, at the hour of 12 M., for the purpose of electing a Board of Directors to serve for the ensuing year, and for the transaction of such other business as may be presented. Transfer books will close on Friday, February Twenty-fifth (25), 1881, at the hour of 12 M. J. W. PEW, Sec'y.

Office—310 Pine Street, Room 15, San Francisco, Cal.

## Booth Gold Mining Company.—Location of principal place of business, San Francisco. Location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Second (2) day of February, 1881, an assessment, No. Three (3), of Three (3) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room No. 44, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Seventh day of March, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the Twenty-eighth (28) day of March, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

GEO. R. SPINNEY, Sec'y.

Office—Room No. 44, No. 310 Pine Street, San Francisco, Cal.

## Blue Bird Mill and Mining Company.—

Location of principal place of business, San Francisco. Location of works, Globe District, Pinal County, Arizona.

Notice.—There are delinquent, upon the following described stock, on account of assessment, No. one (1), levied on the eighth (8) day of January, 1881, the several amounts set opposite the names of the respective shareholders, as follows:

## MINSTRELS.

Open every evening and Saturday Matinee.

## THE TIVOLI GARDENS.

KEELING BROS.....Managers

## THE BOHEMIAN GIRL.

Eddy Street, between Market and Mason. Open every evening.

INCERSOLL  
ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

## MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is hoisted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX,  
49 Fremont St., S. F.

A. S. SPENCE &amp; CO.,

SOLE AGENTS,

537 Market Street.

## \$1,000 CHALLENGE!

## THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of \$1,000 each, and we mean business.

ADAMS &amp; CARTER, Agents, Room 7, No. 109 California Street, S. F.

## DEWEY &amp; CO'S

Scientific Press

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

W. B. EWER.

GEO. H. STRONG.

## A NEW TREATMENT

—FOR—

Consumption, Asthma, Bronchitis,  
Dyspepsia, Catarrh, Headache,  
Neuralgia, Debility,  
Rheumatism,

And all CHRONIC and NERVOUS DISEASES.

PACKAGE CONVENIENTLY SENT BY EXPRESS, READY FOR USE

## AT HOME.

A Treatise on Compound Oxygen, giving the history of this new discovery, and a large record of most remarkable cures, will be mailed free to all who ask for it. Also, "Health and Life," a quarterly journal, containing much interesting information. Write for it. Address the proprietors, DRs. STARKEY & PALEN, 103 and 1111 Girard street, Philadelphia, Pa., or H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., from whom can be procured both information and supplies.

## NOTICE.

TO ALL WHOM IT MAY CONCERN:  
Notice is hereby given that George Denton Cardew is no longer a Director of the Isabelle Gold and Silver Mining Company, of London, England, Limited, and that any Power of Attorney which he may have had from said Company was invalid, for the reasons set forth in the following Resolutions:  
1. Resolved, that as the Power of Attorney given to Mr. Geo. Denton Cardew on the 24th of August last, was not duly authorized, and the seal of the Company was affixed thereto without the authority of a duly constituted Board of Directors, the Directors of the Company hereby repudiate all acts and things done, or caused to be done by Mr. G. D. Cardew, under or by virtue of such Power of Attorney, and that by way of caution the Directors of the Company do rescind the said Power of Attorney, but without in any way recognizing the validity of such Power of Attorney, and such Power of Attorney is hereby rescinded accordingly; and that the solicitor of the Company inform Mr. G. D. Cardew of this Resolution, and request him to return to the office of the Company, the said Power of Attorney.  
2. Resolved, that the Solicitor do forward a copy of the last Resolution to Mr. Lewis Chalmers, the Manager at the Mines, and request him to advertise in such papers in California as he may think necessary, the said Resolution, or the purport thereof; and also the fact of Mr. G. D. Cardew having resigned the office of Director of the Company.  
By order of the Directors,  
LEWIS CHALMERS, Manager.

General Mechanical Engineer and Machinist.  
Steam Engines, Flour, Quartz and Mining Machinery.  
Sole manufacturer of Brodie's Patent Rock Crushers and  
Steel-Faced Tappits. Agent and Manufacturer of F. A.  
Toise's Patent Steam Packing Rings for Steam Pistons.  
The best ever invented; can be applied to any Engine,  
Piston and give entire satisfaction to those using. Steam,  
Hydraulic and Sidewalk Elevators. Repairing promptly at-  
tended to.

### STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz  
Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron  
ranks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

Established in 1850.

### RANKIN, BRAYTON & CO.

Office—127 First Street, San Francisco, Cal.

### Builders of Engines, Boilers, all Classes of Machinery.

PLANTS FOR GOLD AND SILVER MILLS,  
Embracing the latest and most Improved Machinery and Processes for Base and Free Ores.

WATER JACKET SMELTING FURNACES,  
For both Galena and Copper Ores of the Most Improved Construction.

Having Built nearly every successful working Furnace on the Coast, we are prepared to guarantee the best results  
attainable in all classes of Ores.

HOISTING AND PUMPING MACHINERY,  
Embracing all Known Improvements.

WHEELLOCK'S AUTOMATIC CUT-OFF ENGINE,  
Beyond Question the most economical and perfect working Engine now made.

WALKER'S COMPOUND STEAM PUMPS.

The best in use. Will work with thirty per cent. less steam than any other Pump in the market.

Sole Agent for ROWELL'S IMPROVED WHITE FURNACE.

The only successful Chloridizing Furnace made. Over fifty of them in use on this Coast.

Parties Wanting any kind of Mining Machinery are requested to send for Illustrated Circular.

## William Hawkins,

(SUCCESSOR TO HAWKINS & CANTRELL).

### MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturer of

### IMPROVED PORTABLE HOISTING ENGINES,

FOR MINING AND OTHER PURPOSES.

Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehousee  
and Public Buildings.

### Steam Engines and all Kinds of Mill and Mining Machinery.

### Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with  
Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when ad-  
visable.

STEAM LAUNCHES, Barges and Steam Tugs con-  
structed with reference to the Trade in which they are  
to be employed. Speed, tonnage and draft of water  
guaranteed.

STEAM BOILERS. Particular attention given to  
the quality of the material and workmanship, and none  
but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING  
MACHINERY made after the most approved plans.  
Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size  
made in suitable lengths for connecting together,  
sheets rolled, punched, and packed for shipment ready  
to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and  
Water Pipe made by this establishment, riveted by  
Hydraulic Riveting Machinery, that quality of work  
being far superior to hand work.

SHIP WORK. Ship and Steam Capsitals, Steam  
Winches, Air and Circulating Pumps, made after the  
most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City  
Water Works purposes, built with the celebrated Davy  
Valve Motion, superior to any other Pump.

### San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER.

Several first premiums received  
for Quartz Mill Screens, and Per-  
forated Sheet Metals of every  
description. I would call special  
attention to my SLOT CUT and  
SLOT PUNCHED SCREENS,  
which are attracting much at-  
tention and giving universal  
satisfaction. This is the only  
establishment on the coast de-  
voted exclusively to the manuf-  
ture of Screens. Mill owners us-  
ing Battery Screens exten-  
sively can contract for large supplies at favorable rates.  
Orders solicited and promptly attended to.

## An Improved Electro-Medical Apparatus.

Dr. James B. Williams, of 759 Market St., in this city, has lately erected an improved electrical apparatus for medical purposes, an illustration of which is given in the present issue. The apparatus was designed and manufactured by himself for his own use, and is the most complete apparatus of the kind on the coast, besides being one of the most complete in existence.

The apparatus is mounted on a table measur-

can be given to both currents at once, or the galvanic may be slowly interrupted while the faradio is being rapidly interrupted, or *vice versa*.

A is a "short coil" galvanometer wound in two sections between which a small magnet is suspended on a spindle moving with very slight friction. The number of degrees marked off on the dial plate by the needle bear a proportion to the strength of battery current used.

The current selectors, N, introduce into or remove from circuit any number of cells from 1 to 60. The switches are arranged so that the circuit is never broken while the strength of

The strata in which the secondary coils are wound, contain various sizes of silk-insulated wires—coil No. 6 containing No. 40 wire, the finest manufactured—carefully insulated from each other, and the entire system of secondary coils literally embedded in an insulating medium.

The switch, J, selects the currents from the secondary coils in such a manner that different combinations of currents can be thrown into two of the binding posts, seen at M. By the use of this switch a current can be selected to suit any particular case without having the trouble of unfastening the conducting wires and without breaking the currents.

brass connected with the positive and negative poles of the battery. Revolving the cylinder causes the brass plates to press alternately upon two upright springs, thereby changing the direction of the currents at every half revolution of the cylinder.

The rapid commutator, G, consists of a cylinder, the halves of which are insulated from each other, mounted on a spindle, driven by a system of wheels. This apparatus will reverse any current as many as 60 times in a second, or by adjusting a set screw, the same apparatus will interrupt instead of reverse.

The astatic galvanometer, F, indicates the

AN IMPROVED ELECTRO-MEDICAL APPARATUS.

ing 4x2 ft., and connected by insulated wires, O, to a stationary battery of improved construction containing 60 cells.

The different pieces composing the apparatus are connected with each other by means of doubly insulated wires, no one piece being independent of the rest of the apparatus. The action of each piece is controlled by suitable switches and can be thrown into or removed from circuit instantly without interrupting the flow of the current.

All the pieces are worked by the current from one battery only and arranged in such a manner that any or all currents generated by the apparatus, whether faradic or galvanic, may be used simultaneously, if required.

Any degree of rapidity to the interruptions

the galvanic current is being increased or diminished. This is an important feature, for by its use disagreeable shocks are avoided.

The faradic rheotome, E, consists of an upright electro-magnet, which attracts three armatures mounted on vibrating springs. By adjusting the springs any degree of rapidity can be given to the interruptions of the faradic currents from the very rapid to that of a slow pendulum motion.

The induction coil, C, consists of a primary coil surrounded by six secondary coils. These coils are wound in planes perpendicular to the long axis of the primary coil, and can be combined in different ways to produce "harsh" or "smooth" currents, thus adapting them to the most sensitive persons.

The rheotome, D, is built upon the framework of a telegraphic register, the clockwork of which gives motion to a revolving cylinder. This cylinder is divided into sections, upon which a series of springs are made to press by a system of levers. The sections contain an insulated material at regular intervals; and with the combination of levers and springs any current, whether galvanic or faradic, may be interrupted from one-half to three and a half times a second. The circuit is regulated through the agency of an electro-magnet, fastened to the framework, all the breaks being made with platinum points.

The commutator, H, reverses all the currents generated by the apparatus. It consists of a cylinder upon which are fastened two pieces of

strength of the galvanic current while passing through the body. It is so sensitive that the current from one small cell passing through the entire length of the body will cause the needle to be deflected several degrees. A "shunt" is added so that the strength of the current from any number of cells can be indicated.

The water-rheostates, B, are used to regulate the currents, acting on the same principle as the "shunts" of a galvanometer, that is, by introducing more or less resistance into an accessory circuit, thereby controlling the current in the principal circuit. With their use, currents may be regulated better than by any other method.

(CONTINUED ON PAGE 172.)

## Notes on the Marine Fishes of the Pacific Coast.—No. 2.

(Read before the California Academy of Sciences by W. N. LOCKINGTON.)

## Fam. Batrachidae.

*Porichthys porosissimus*; Toadfish.—This, the only known representative upon this coast of the family of the toadfishes or Batrachidae, is common along the entire length of the Californian sea board, and although not eaten by the Anglo-Saxon population, figures in the dietary of the Mongolian. It is a shore fish, and may be found at mid-summer under rocks between tide-marks, engaged in the deposition of its ova; which are of comparatively large size.

Like some members of the Sciaenidae, this fish has the power of producing a grunting sound, and does not fail to do so when handled. It may be readily recognized by the rows of silvery pores along its sides and abdomen.

This is one of those fishes that occur on both the Atlantic and Pacific shores of America; but it is curious that its range on the Atlantic coast appears to be limited to regions bordering on the equator, while upon this coast it extends to comparatively high latitudes.

## Trachinidae.

The fishes belonging to, or nearly related to this group, are not abundant upon our coast, and are therefore of but slight economic value. The largest and most important is *Caualotilus anomalous*, Cooper; probably identical with *C. princeps*, Jenyns, a species found at the Galapagos islands. This form, which is said by Cooper to be called "White fish" at Santa Catalina island, where it is tolerably common, has its northern limit at the Bay of Monterey, whence examples are occasionally brought to San Francisco, and, becoming more abundant south of Point Conception, ranges by San Diego along the coast of Lower California to Cape San Lucas; and, if identical with the *princeps* of Jenyns, southward to the equator.

It attains a weight of 10 to 14 lbs., and a length of over two ft., and is, when adult, exceedingly oily, the adipose tissue being especially developed just behind the head, causing the proportions of the adult to differ considerably from those of the young. The soft dorsal and anal fins are very long, the preoperculum serrated on the edge, and the scales small and ctenoid. Prof. Jordan states that many are salted and dried by Americans and Chinese in the southern part of the State, and that it ranks high as a salted fish, and fair as a fresh fish. It feeds largely on crustacea.

Another of the group, perhaps forming the type of a distinct family, is the very curious soft-nosed form described as *Icosteus anigmaticus*. Scaleless, with a row of prickles along the lateral line, and smaller ones on the fin-rays; of a thin, compressed form, and with bones so soft that the body can be folded up like a rag, this fish well deserves the name of *anigmaticus*. Three examples are all that I have seen, and Prof. Jordan did not obtain it during his trip northward, although it is certainly a northern form, and probably lives in deep water. Those in the museum of the California Academy of Sciences were accompanied by a small fish covered with scales, but otherwise evidently nearly related. This has now been described by Prof. Jordan as *Ichthyos lockingtoni*.

## Suckers.

Besides the well-known sucking fish, or Remora, there are four other fishes on this coast which have a right, by reason of the presence of an adhesive disk, to the name of suckers. The sucking apparatus of the Remora is upon the back of the head, but that of all the others is upon the abdomen, and is formed, to a greater or less extent, by the ventral fins, which are altered for the purpose. Three of these suckers are found upon the coast of California, and belong to two different families, characterized by the structure of the sucker. Two of them belong to the *Liparidae*, and have the ventrals transformed into the center of a sucking disk, which is completed by a margin of skin. In these species the ventrals are of course united, while the rays of those fins form so many cross bars upon the sucking disk.

In the remaining species the ventrals are widely separated, the entire width of a depressed, flat-bottomed abdomen intervening between them. The front part of the sucking disk, which is very large, is formed by the ventrals, but the larger portion is a cartilaginous expansion of the bones called coracoid bones, which form part of the shoulder girdle or thoracic ring, to which both pectoral and ventral fins are attached. These coracoid bones are partly free, and extend behind the base of the pectorals. The two *Liparidae* (*Liparis pulchellus* and *Neoliparis mucosus*) have a long dorsal and anal fin, without any stiff spines; the top of the head is depressed, and they share with the Cottidae the character of having the suborbital bones connected with the preoperculum. In these fishes the connection is formed by a slender process extending backward from the former bone. In *Liparis pulchellus* the skin is exceedingly loose and flabby; the dorsal and anal fins are continuous with the caudal. In the other species the tail fin is distinct from the other vertical fins, and the skin is less loose. *L. pulchellus* is, when fresh, marked by numer-

ous longitudinal or netted bright brown lines. In the third species, *Gobiosoma reticulatus*, the front part of the body is very much depressed, and very wide, to accommodate the large sucking disk, while the hinder part, on which both dorsal and anal fins are situated, is compressed and tapering. The last species is found on the ocean beach along the entire coast of California; the two first occur within the bays of San Francisco and Monterey. *Liparis pulchellus* is abundant in some localities, and is occasionally brought to our markets.

Gillichthys Mirabilis (Cooper), the Long-Jawed Goby.

This fish, first noticed by Dr. Cooper at San Diego, has since been proved to be one of the most abundant of species from Cape Mendocino southward. In lagoons, mud-flats, and along the borders of the tidal creeks it is the commonest of fishes, and numerous little examples sent to our local museum from artesian wells have proved to be its young. The general appearance of the young is very different from that of the adult, in consequence of the great development of the jaws in the latter. The very young *Gillichthys* looks like any ordinary Goby, with ventral fins united into a funnel-like disk, but as age increases, so does the length of the maxillary or upper jaw-bone, which finally extends backward along the sides of the head to beyond the insertion of the pectoral and ventral fins. This long fold of skin and cartilage is free from the side of the head, and not improbably serves as a reservoir of water to keep the gills moist when, from a low tide or other causes, the water fails for some time to reach the holes in which the species dwells. The Chinese dig up this fish from its hiding-place in the mud, and eat it with relish, and white people who have tasted it second their opinion.

One of the Blennidae of this coast—*Neoclinus satiricus*—has a backwardly prolonged jaw of somewhat similar structure.

## Agonidae.

The fishes of this family are neither sufficiently large nor of sufficiently common occurrence to be of value as food to man, but their bizarre forms and the singular armature of their bodies render them objects of interest. The body is sheathed with several, usually eight, series of plates, forming as many angles, so that the name of the family—Agonidae—without angles, appears to have been given in jest. The upper and lower series are usually confluent anterior to the caudal fin, and the lower side of the body, anterior to the pectorals, is variously protected. The angles of the plates are often more or less spinous, and the bony head is furnished with spines or barbs.

In the genus *Podothecus* the upper jaw overhangs the lower. Three species of this genus occur upon this coast—viz., *P. acipenserinus*—a form long known to science, and easily recognized by the numerous barbs beneath the chin; *P. vulsus*—first described by Prof. Jordan from a specimen found in the markets of San Francisco, and characterized by numerous spines upon the head; and *P. trispinosus*—described by myself ("Proc. U. S. Nat. Mus., 1879") from specimens found in the markets of this city. The last is smaller than either of the preceding, not exceeding three inches in length.

Of the genus *Brachyopsis*, in which the lower jaw is longer than the upper, and reaches to the upper surface of the head, two species occur on the coast of California, both of them reaching a length of about six inches. *B. verrucosus* was first described from numerous examples taken in Drake's bay, and has since been found in San Francisco market, and *B. zyosternus*, I. X. G., is common in Monterey bay.

In the former species the breast is protected by several roundish plates, giving it a warty or verrucose appearance, while in the latter the same region is covered with prickles.

## Cottidae.

At least eighteen species of Cottidae, or bull-heads and sculpins, are known to occur upon the coast, or in the rivers of California, yet only one of the tribe—*Scorpenichthys marmoratus*—is habitually sold as food. This species is common in the Bay of San Francisco. Its young are frequently brought to market mingled with those of rock-cod, and furnish amusement and pabulum to the boy who angle from the wharves, and the adults are brought, though in small quantity, into our markets with tolerable regularity. This species ranges along the entire Pacific coast of the United States. Two species of the tribe are confined to fresh water, but all the others are marine. Some of the species are scaleless, while others are more or less covered with prickles, or with bands of rough scales of rather large size. The genus *Oligocottus* contains three species, which are among the smallest of fishes.

A curious member of the tribe is *Ascelichthys rhodorus*, lately described by Jordan and Gilbert from Washington Territory, and since found at Gualala, Mendocino county, by Mr. Rivers, Curator of the State University Museum. This little fish has no trace of ventral fins, and in this respect differs from every other cottoid yet known.

The common Sculpin or Drummer, *Leptocottus armatus*, is abundant everywhere along the coast in lagoons and sheltered bays, especially on a muddy bottom, and is sometimes dried by the Chinese, who do not esteem it. The Chinese also take *Hemilepidotus spinosus*, the Cap-eone, or set lines in rather deep water at Monterey, where it is tolerably common, but they do not consider it choice food. When the head and skin of a Cottoid are removed, there is com-

paratively little left, and that little is coarse and dry.

An old friend is the

## Sword Fish.

*Xiphias gladius*, the same sword fish that is known to the dwellers around the Mediterranean sea, and the same that is popularly supposed to molest the whale. That a sword fish which can run its long upper jaw, impelled by the muscular force of a body 10 or more ft. in length, through the side of a ship, could hurt a whale if it chose, is evident, but the real enemy of the whale is the grampus, a toothed cetacean, second only to the whale in size, since it ranges from 20 to 30 ft. in length.

The occurrence of this fish upon our shores has been noted by Prof. Jordan, who saw one from the deck of a steamer off Santa Monica, so that it may be included in the catalogue of those fishes which extend northward at least as far as Point Conception. It is occasionally seen by fishermen at Santa Catalina island, but is not taken, as it does not come in to the shore nets.

## Family Cyprinoclonidae.—Toothed Minnows.

This large family, well represented though it is in America, has but two members in our State, both confined to the extreme southern portion of it. The species inhabit fresh or brackish water, lagoons, muddy lakes and similar situations.

The native species are valueless as food. In all the tribe the dorsal fin is placed far back, upon the caudal part of the body. The sexes frequently present some differences. *Fundulus parvipinnis*, the better known of our two recorded species, was found by Profs. Jordan and Gilbert, as far north as San Luis Obispo, and it is common at San Diego. It does not exceed three inches in length. The male has larger fins than the female.

## Families Synodontidae, etc.

A group of more or less related families, distinguished on the one hand from the salmon tribe by the exclusion of the maxillary bones from the margin of the upper jaw, by the absence of an air bladder, by the fewness of the pyloric appendages, and by the exclusion of the eggs by means of oviducts, was named by Dr. Gunther *Scopelidae*. Later naturalists have divided this group into four. From the herrings these fishes are distinguished by the presence of an adipose or fatty dorsal fin, and by the rounded abdomen. In the herrings the upper jaw is formed partially by the maxillaries.

All the members of this group of families are inhabitants of the open ocean or of the ocean depths, and it is among these and other deep sea tribes that further ichthyological discoveries upon this coast must be looked for.

The four known species, none of which are sufficiently abundant to be of value, are *Synodus lucioceps*, which is occasionally taken in San Francisco bay and ranges along the Pacific coast of America; *Sudis ringens*, at present known only from a single specimen taken by Prof. Jordan from the stomach of a *Merluccius*, itself in the stomach of an albacore, *Alepidosaurus borealis*; and *Myctophum crenulare*. The first reaches a length of 18 inches, is sometimes brought to the markets of San Francisco, and is often taken with hook and line from the dock at Santa Barbara. Together with all the rest of its family (*Synodontidae*) it has a short dorsal fin, placed in or near the center of the length of the back. In *Sudis* (*Paralepidus*) the dorsal is on the hinder part of the body, while in the *Alepidosauridae* it occupies nearly the entire length of the back. The latter are predatory fishes of considerable size, furnished with formidable teeth of very unequal size. These teeth are constantly changing, so that the dentition is not exactly the same in any two specimens. Only the head of our species is known, but from its size it is evident that the entire fish must be three ft. or more in length. It is occasionally driven ashore after storms. The only specimen of *Myctophum crenulare* yet known was taken this year from the stomach of an albacore in Santa Barbara channel.

P. S.—Prof. Jordan has discovered that the salmon (*Oncorhynchus*), which has been called *O. kemmerlyi*, and identified with the "red-fish" of the Indians, is really the young male of *O. nerka*, the "blue-back."

NEW DISTRICT.—The staid people of Riverside, says the Press, have an excitement. On Wednesday last David Meacham brought samples of rock to Riverside which looked rich. At first it attracted but little attention, but by Thursday afternoon it was rumored that rich rock had been discovered just south of the arroyo, above the upper canal. Free gold in the rock was a common occurrence, and many who got into the secret started for the rich diggings. Night came on, but the prospectors stood by the work and did not even sleep on their arms. All night long, with lantern in hand, the work of tracing the ledge and locating claims was continued. Friday morning others went to the new El Dorado, and to-day the hills are full of prospectors. It is said that some of the ore being crushed in a crude manner yielded \$2,000 to the ton. This is supposed to be the northwestern extension of the Pinacarta mines, and if the lead continues in the same direction, still farther, it will pass right under the town site of Riverside. In fact, during the past few days, rich rock has been found within the town limits.

THE hydraulic pumps for the 2,400 ft. level of the Chollar-Norcross-Savage shaft are arriving and will be put in as fast as possible. A new cable for this shaft has also arrived.

## Stiles' Quartz Mill.

A Nevada City Transcript reporter has visited W. C. Stiles' quartz mill on Gold Run, near the railroad depot, and witnessed the operation of the very novel machinery connected therewith. The mill, which was invented by Mr. Stiles, has but one stamp. The following description of its workings will be found interesting by all miners or mill men:

The frame or wood work is similar to that of any other battery, as are the cam and camshaft. Upon the stem or stamp is a sleeve, which is operated by a beveled gear, and is driven by an independent belt. This sleeve carries a shoe bent like a sickle, which revolves inside the battery and serves as a scraper to draw the quartz under the stamp. The mill acts as a rock-breaker, reducing the ore from dimensions of four or five inches in diameter to the size of an ordinary marble, or smaller. The capacity of it is shown to be from 12 to 15 tons per day on this sized material.

The mass is then passed through a pulverizer made in the shape of a cylinder about eight inches wide and 24 inches in diameter. This is hung on a shaft and is driven about 300 ft. per minute. Upon another shaft is a wheel one-half the diameter of the cylinder, which is driven in the same direction, but much faster—say 600 ft. per minute. This wheel and the inside of the cylinder are of V shape, one inside of the other, and matching. The wheel-shaft is hung in sliding boxes, and can be made to mesh with a force of one, two or twenty, as the hardness of the quartz may demand. Anything passing between these dies and the wheel can be reduced to any degree of fineness required. The capacity of the small grinder on exhibition is five tons per day, and requires but two-horse power to operate it. It can be driven by one horse and do proportionate work. The inventor claims that by making the shafting larger, four, six or ten horses may be employed, reducing proportionately larger amounts. In order to accomplish this, the quartz, which is now put in in particles the size of beans, would be made about the size of marbles, and the speed at which it is run would also be increased from 600 ft. per minute to 1,000 or 1,200 ft. These changes, it is said, would quadruple the amount reduced.

The entire machine weighs but 1,500 lbs., frame and iron work complete. It is, therefore, readily transported by mules from one point to another, while the cost of construction is merely nominal.

Mr. Stiles says, further, that he has found the pulverizer to be an excellent device for grinding wheat and barley, thus rendering the invention one of importance to farmers as well as miners.

EXTRAVAGANCE IN MINING CAMPS.—The Rocky Mountain Mining Review in a recent number contains a sensible article on extravagance and waste in mining camps, in which it says: "It is necessary now in order to insure success, that mining should be carried on in as systematic manner as any other business; but it is a well-known fact that it is not every one that is conversant with mining that knows well of the thousand and one things which bring the net results down far below what they should be. We have not the room to print, neither do we care to speak of the many serious wastes caused by negligence or ignorance on the part of superintendents and managers. Several years since, with great flourish of trumpets, an English company came here and invested heavily in the mines at Hall's Gulch. Fine tramways and elegant houses were built, grounds were laid out that would have been a credit to a Rothschild, but the treasury was at last emptied, and the stockholders refused to come down with more capital. Work was shut down, and to-day Hall's Gulch is not one-tenth as well known and not producing one hundredth of the amount of ore it would have been had the work been properly done. Recently a gentleman leased one of the dumps of a mine in that gulch and has been digging out the ore and shipping it, and after he has paid all expenses of working, shipping and milling the ore he makes over \$50 per ton as net profit."

HARSHAW DISTRICT, ARIZONA.—We learn from Mr. W. B. Caldwell, of Harshaw, that affairs in that camp are assuming a more lively aspect than ever before. Work on all the mines is being vigorously prosecuted, and the prospect of the output is flattering. The Hermosa or Harshaw mine is working a force of about 75 men. The mill works about 95 tons of ore per day. Last month nearly 30,000 tons were worked. The mill is a model affair. It is provided with the most improved machinery and apparatus, requiring but one-fourth the usual number of hands to run it. The Trench mine has the finest hoisting works in the Territory. The main shaft is down 300 ft.—150 ft. below the deepest point in the old workings. The Alta mine has about 3,000 tons of ore on the dump. One hundred tons are to be hauled to the Boston mill, on the San Pedro, for a working test, which will decide whether a mill or furnace is necessary to reduce the ore. A great deal of work is being done at Mowry camp, and some splendid ore is being brought to the surface.—Citizen.

THE Superintendent of the Best & Belcher and Gould & Curry joint shaft writes that he expects to have the pumps in place and everything in readiness for sinking by the 1st of April.

MECHANICAL

PROGRESS.

Brazing and Soldering.

The term soldering is generally applied when fusible alloys of lead and tin are employed. When hard metals, such as copper, brass or silver are used, the term brazing (derived from brass) is more appropriate.

In uniting tin, copper, brass, etc., with any of the soft solders, a copper soldering-iron is generally used. This tool and the manner of using it are too well known to need description. In many cases, however, the work may be done more neatly without the soldering-iron, by filing or turning off the joints so that they fit closely, moistening them with soldering fluid, placing a piece of smooth tin-foil between them, tying them together with hind wire and heating the whole in a lamp or fire till the tin-foil melts. We have often joined pieces of brass in this way, so that the joints were quite invisible. Indeed, with good soft solder, almost all work may be done on a lamp without the use of a soldering iron.

Advantage may be taken of the varying degrees of fusibility of solders to make several joints in the same piece of work. Thus, if the first joint has been made with fine tinner's solder, there would be no danger of melting it in making a joint near it with hismith solder, composed of lead four, tin four and hismith one; and the melting point of both is far enough removed from that of a solder composed of lead two, tin one and hismith two to be in no danger of fusion during the use of the latter.

Soft solders do not make malleable joints. To join brass, copper or iron so as to have the joint very strong and malleable, hard solder must be used. For this purpose equal parts of silver and brass will be found excellent, though for iron, copper, or very fusible brass, nothing is better than silver coin rolled out thin, which may be done by any silversmith or dentist. This makes decidedly the toughest of all joints, and as a little silver goes a long way, it is not very expensive.

For most hard solders borax is the best flux. It dissolves any oxides which may exist on the surface of the metal, and protects the latter from the further action of the air, so that the solder is enabled to come into actual contact with the surfaces which are to be joined. For soft solders the best flux is a soldering fluid which may be prepared by saturating equal parts of water and hydrochloric acid (spirit of salt) with zinc. The addition of a little sal-ammoniac is said to improve it. In using ordinary tinner's solder, resin is the best and cheapest flux. It possesses this important advantage over chloride of zinc, that it does not induce subsequent corrosion of the article to which it is applied. When chlorides have been applied to anything that is liable to rust, it is necessary to see that they are thoroughly washed off and the articles carefully dried.—*Indianapolis Mechanical Journal.*

**WHY SAWS HEAT.**—One whose lot it has been to hang and put into operation hundreds of circular saws, and traveling from mill to mill trueing saws and putting the machinery in order, says: "Saws heated at the center are almost invariably the fault of either the mandrel heating, or the collars not being properly turned, or sometimes the saw may not be in proper line with the carriage, or the track out of order. Saw heating at the rim and not at the center, is generally the fault of the saw leading too much into the log, causing it to hear too hard against the outside guide. The above defects are among the most prominent. Often the machinist in putting in the lug-pins of a mandrel will turn them too large, thus drive them into the collar with a hammer, and swell the metal around the pins without noticing the defect. In such a case, the saw will only have a hearing at a small surface around the pins, and never fit nor hang true until the metal is chipped or filed off level with the face of the collar. Often the collars will not run true; this defect should be corrected at once."

**HIGH-SPEED ENGINES.**—The *Mechanical Engineer*, of January 22d, has the following paragraph: "The Buckeye Engine Company, Salem, have in hand a non-conducting engine for Thomas Edison, Menlo Park, New Jersey, intended to run at 450 revolutions per minute, and develop 100 to 150 indicated horse power, at a pressure of 125 lbs. The cylinder is 10 inches in diameter by 12-inch stroke, and will be connected directly to the dynamo-electric machine it is to drive." When Porter commenced to run his 10 by 12 engine 216 to 224 revolutions, 10 years ago, most people thought he was crazy, and some did not hesitate to say squarely that "Porter had turned fool." This result seems to be that Porter was neither foolish nor crazy, from the fact that half a dozen persons are now building high speed engines, or something which they call high speed.

An invention has recently been patented to prevent the explosion of steam boilers by placing a partition across the boiler slightly above the water line, providing an opening through this partition, which is adjustable, and through which the flow of steam can be regulated to be equal to the average intermittent flow required for the engine. It is claimed that this prevents dangerous variations of pressure on the surface of the water, hence preventing explosions.

METEORIC IRON.

SCIENTIFIC

PROGRESS.

In connection with the above we may call attention to an article which appeared a few years since in the *London Engineer*, on the recent improvements which have been made in the manufacture of iron, in which it was correctly stated that the truth is now rapidly gaining ground that, wherever mechanical strength is desired, an alloy is preferred to a pure metal. One of the greatest obstructions to the mechanical value of iron, is its tendency to crystallize. Whether this article be a monster gun or a ship's cable, the result is the same. The tendency of iron thus to crystallize may, unquestionably, be prevented by the admixture of other metals. In almost every direction, nature has placed certain metallic masses, to which the name "meteoric iron" has been given, on the supposition that these masses have fallen from the atmosphere. The composition of meteoric iron, wherever found, is chiefly of iron and nickel, the latter varying from 2% to 10%, with small quantities of cobalt, and, it is said, chromium. Science has made artificial meteoric iron, and it has been tested. Its qualities have proved identical with those of the native compound. In addition, it is more ductile, and has more tenacity than pure iron, and is not so liable to rust or oxidize. Possessing such qualities, meteoric iron is certain to become an important branch of industry. A mixture of 93 parts of iron and 2 of nickel, has all the peculiarities of best meteoric iron. Some 20 years ago an ore of sulphur of arsenic, devoid of arsenic, was found in Inverary, in Scotland, and, by its means, meteoric iron has been made of the best quality.

The Theory of the Bessemer Process.

There is nothing like knowing the reasons of things. A writer in a Western journal thus explains the decarbonization of iron in the Bessemer converter: Some inquisitive reader may be desirous of knowing "why there should be this effect of the air-blast through the melted cast iron?" Webster says that "it burns out a portion of the carbon." We say that the air, forced through the molten metal, blows out its impurities. The changed appearance of the flames from a dead red to a clear white light indicates this fact.

Says another: "Why add spiegeleisen?" After forcing the air through the liquid iron it becomes more or less porous. The spiegel contains a large per cent. of manganese. This attracts, gives density, cohesion and tensile strength to the compound. Some illustrate the change by the formation of a seedling powder. In this the parts separated are an acid and an alkali. Combined it is a new liquid—differing entirely from its component parts. Now, it cleanses and purifies the stomach. So the cast iron, freed from its impurities, and in a fluid condition, the spiegel, highly charged with manganese, and, also in a fluid state, immediately combines all its properties with the iron, and the result is a fine quality of steel, possessing great hardness and sufficient tensile strength for the best kind of steel for railroads.

**A SOLDERING fluid** which does not occasion rust is prepared in the following manner: Small pieces of zinc are immersed in muriatic acid and left in it until the acid is saturated with it, which may be known by the cessation of ebullition of the acid, and also by the zinc, after that stage, being left undissolved; add spirits of ammonia, about two-thirds of the quantity of the acid; thin with a little quantity of rain-water. When, at the time of adding the zinc, if the muriatic acid is heated to a low degree, the solving of the zinc will be achieved sooner. This fluid does not cause rust on iron or steel, and is excellent for all purposes, even for tinning.

**INTERESTING EXPERIMENTS.**—A very important and valuable series of experiments on the strength of wrought iron columns has been made by Mr. G. Bressacren. It includes a large number of columns made by the Union Iron Mills, Pittsburg, by the Cleveland Rolling Mill, Cleveland; the Phoenix Iron Co., Phoenixville; the Pencoyd Iron Works, Philadelphia, and the Ohio Falls Iron Works, New Albany, Ind. The paper was read before the American Society of Civil Engineers, and is published in the last December number of the transactions of that body.

**SULPHUR IN LUBRICATION.**—It has long been known that sulphur cools a hot bearing, but the reason why is doubtful. Von Heeren states that the fine metal dust formed when a journal runs hot, and which strongly acts upon both journal and bearing, forms a sulphide with this sulphur. This compound, which grows soft and greasy, does not cause any appreciable amount of friction. Sulphur and grease in combination are in regular use on board the steamers of the North German Lloyd.

**NEW STEAM ENGINE INDICATOR.**—A new indicator has been invented in Norway, by which the ordinary motives are reversed. The card is stretched upon the quadrant of a cylinder, which receives the reciprocating motion from the steam in the cylinder, and the pencil is attached to mechanism connected with the piston rod. The pencil can be moved sideways so that a continuous number of diagrams can be taken without moving the card. It is connected in the usual way with the steam cylinder.

SCIENTIFIC

PROGRESS.

Electrical Shadows.

Some curious phenomena—electrical shadows so-called—have been lately described by Herr Holtz to the Gottingen Academy. They are best got by fixing to one discharge rod of a Holtz machine a large concave disc with a piece of silk without wrinkles, adhering to it by electric action; at the point of the other rod, placed opposite, appears, when the machine is worked, a small, feeble, luminous star, and on the disc a luminous circle, and the shadows appear on the latter when objects are interposed. That they are not optical shadows is proved, *inter alia*, by the fact that not all objects give them. They are produced in general only by conductors or semi-conductors; insulating bodies, when small, give no shadow; when large they may give some shadow at first, but this gradually goes out as the action of the machine is continued. It makes no difference whether the conducting bodies are connected with the earth or insulated. The shadow-forming power is to be measured not only by the darkness of the image but by the magnification. Herr Holtz tried pasteboard, ebonite, silk, linen, knitting-needles and glass rod or tubes; the former he used in the form of strips, crosses and rings. The size and form of the shadows are affected by various things. The shadow is larger or smaller according as the body approaches the point or the large surface. It enlarges, too, outwards from the center of the disc, so that the shadow of a strip of uniform width is narrowed in the middle. It is further notable that, to a certain limit, strip gives the same shadow, whether it is placed with its broad side or narrow edge toward the disc. A system of strips placed edgewise, gives the same shadow as a homogeneous piece. Various instructive experiments may be contrived thus, a cross of pasteboard and ebonite gives only the shadows of the pasteboard, but by breathing on the cross a full cross shade momentarily appears. A glass rod with one end made conducting by heat gives a partial shadow, which gradually disappears in cooling; and so on. Herr Holtz does not at this stage say much as to what the phenomena mean.

**ADULTERATION OF SALICYLIC ACID.**—The large use which is now being made of salicylic acid, has recently led to its very common adulteration. According to the *Textile Colorist*, sugar, starch, sulphate acid of potash, sulphate of lime and silica are substances entering into its adulteration. Phenol, sulphuric and muriatic acids, even salts of soda, can also be used for this sulphurification. To detect the presence of phenic acid in salicylic acid, or in salicylate of soda, one gram of concentrated sulphuric acid in 20 centigrams of salicylic, being well mixed, gives a preparation which demonstrates the adulteration by the following method: Add to this preparation one or two drops of nitrous sulphuric acid, which can be obtained by mixing 20 centigrams of nitrate of potash in 30 grams of sulphuric acid. If any greenish coloration takes place in the contact, it indicates the presence of phenol. Some nitro-prussiate of soda, in powder, put into the first preparation, produces a reddish or pinkish color, according to the proportion of phenol. Nothing of this kind takes place when the product is pure. Any azotates will reach the above, showing a dark color when phenol is in it; and if neutralized by ammonia, a yellow dye is produced with some chance of usefulness, as its tinctorial power is quite considerable.

**LIGHT AND HEAT** have for some time been regarded as essentially the same thing—being only different manifestations of the same radiant energy; but it is only quite recently that this theory has been satisfactorily demonstrated. By the use of a Rutherford grating and a delicate thermal balance, Prof. Langley of Alleghany (Pa.) Observatory, recently succeeded in obtaining for the first time full and exact measurements of the distribution of energy in a pure spectrum, where no lens or prism had been used, and of fixing its relative amount as determined accurately by the wave-lengths of light in all parts of the visible spectrum and in the ultra red. The essential result is of high theoretical value. It is that heat and light as received from the sun are now experimentally proved, so far as such measurement can prove it, to be in essence the same thing. The old delineations of essentially different curves representing heat and light must be banished hereafter from text books. The old views on this subject can no longer be maintained even by European men of science, who are prepossessed in their favor. This result, fulfilling what was almost a prophecy when it was made, a quarter of a century ago, by the elder Draper, and being due largely to means which science owes to Mr. Rutherford, may, if obtained, be most fairly claimed as largely due to the two Americans whose names have just been cited.

**ELECTRICAL TEST FOR OILS AND SILKS.**—Prof. Palmieri, of Naples, has recently constructed an apparatus which allows the purity of oils to be judged of by the resistance that they offer to the passage of electricity. Olive oil—a poorer conductor than any other—is taken as the standard of comparison. The apparatus may also serve to reveal the presence of cotton in silk fabrics; for a very small portion of cotton in silk tissues greatly increases the conductivity of the latter.

Electric Light Good for the Eyes.

When the electric light began to be used in our shops, factories and places of amusement, it was confidently asserted by its opponents that so dazzling a light must be injurious to the eye. The objection seemed plausible at least, although the light when diffused seemed to have the quality of bright moonlight, which is the reverse of irritating. People would persist in looking at the source of the light, and as the early lamps were far from steady, the observer's eyes suffered both from the intensity of the light and the sudden and large variations in the quantity of it. It appears, however, from the experiments recently made by Professor Cohn, of Breslau, whose name is so familiar in connection with the investigation of color blindness and other optical defects, that our eyes will be benefited rather than hurt by the new method of lighting, and it is obvious that with incandescent electric lighting the advantages will be still more marked.

While testing the influence of electric light on visual perception and the sense of color, Dr. Cohn proved, he thinks, that letters, spots and colors were perceived at a much greater distance under electric illumination than by gas light or even daylight. Compared with daylight, the electric light increased the sensation of yellow 60 fold, red 6 fold, and green and blue about 2-fold. Eyes that in daylight or gaslight could perceive and distinguish colors only with difficulty were much aided by the electric light, and the visual perception was much strengthened. In all cases of distant signalling Dr. Cohn believes that the electric light will prove exceedingly and especially useful.

**NEW USE OF TUNGSTATE OF SODA.**—Prof. Sonnenschein, of Berlin, some time back found that when glue in thick solution is mixed with tungstate of soda, and hydrochloric acid is added, there is thrown down a compound of tungstic acid and glue, which at from 86° to 104° F. is so elastic as to admit of being drawn out into very thin sheets. On cooling this mass becomes solid and brittle, but on being heated it becomes soft and plastic. This material has now been employed as a substitute for alumen in fixing aniline colors in calico printing, and it has been tried in tanning, but produces hard and stiff leather. As tungstic acid renders fabric incombustible, its use in calico printing is a valuable feature. How far it is applicable in the manufacture of paper remains to be seen. Tungstic glue is recommended as a lute and cement. It may also have an application in the manufacture of billiard balls, knife handles, and as a substitute for India rubber.

**PREHISTORIC ENGLAND.**—Probably no man has more thoroughly explored or more carefully studied the ancient caves of Great Britain and their contents than Prof. W. Boyd Dawkins, F. R. S., who lately delivered a public lecture in London on the early inhabitants whose traces are discoverable in these caverns. Among the interesting results of his investigations he mentioned that the horse was used for food by these primitive people, and probably also the dog. The dog of those times appears to have been a much larger animal than the average dog of the present day. Fire was obtained by striking a light from the familiar mineral, iron pyrites. The potter's wheel does not seem to have been known, but pottery was made by hand. The cave implements show that the prehistoric inhabitants ground corn, and engaged to some extent in mining operations.

**CARBONIC ACID GAS IN THE ATMOSPHERE.**—In a lecture recently delivered by Prof. Ira Remsen, at Baltimore, that scientist maintained that air may contain 1-20th of its volume of carbonic acid gas without producing evil effects—a conclusion by no means novel, but sustained by such chemists as Berzelius and Pettenkofer. He stated that the most delicate tests failed to reveal the presence of carbonic oxide in the atmosphere of rooms heated by furnaces or by cast-iron stoves. According to his opinion there may be other pernicious gases in the air breathed, but there is no reason whatever why the deleterious effects should be attributed to carbonic oxide.

**ACTION OF VEGETABLE ACIDS ON TIN.**—Prof. Chas. E. Muoro, of Annapolis, states that the ordinary fruit acids, such as those contained in apples, tomatoes, rhubarb, lemons, etc., all act upon tin. Some cider which he examined, and which had been stored in a tin fountain, contained 117 milligrammes of metallic tin to the liter in solution. One case was given where persons eating fruit preserved in tin cans were made violently sick, and tin only was found in the fruit. Corrosion of tin pipes by water was referred to, and it was suggested that the corrosion was due to the vegetable acids in the water.

**THE STARS.**—About 5,000 stars are visible to the naked eye. There are 18,000,000 stars in the Milky Way. Even the stars that we call fixed are in constant motion. Arcturus moves through space three times as fast as the earth, but it takes a hundred years to move the eighth part of the apparent diameter of the moon.

**A CURIOUS FACT.**—It is a curious fact, lately noted by M. Bounguy, that if boiling water be projected on an incandescent surface, its temperature falls at once to 97° C. He is of the opinion that this is due to work expended in production of the spheroidal state.

Check, has let a contract to run a tunnel to tap the ledge on the Martha Ann quartz mine, on Otter Creek divide. They will tap the ledge some three next week, when they may expect to hear of a rich development.

D. Gibbs and F. W. Hubert located a quartz claim on the first of last month, on Dark canyon, about a mile from town, which they are prospecting with favorable results.

The Knox boys are prospecting a seam on Lousey gulch, which looks fine. That has been one of the richest gulches in these parts, and the boys may find a strike if they are lucky.

Frank Chizek has located a quartz mine on the north side of Canyon creek, and is getting some good prospects. We learn of several more quartz claims being located since last week, in this vicinity.

**INYO.**  
GOLD SHIPMENT.—Independence, Mar. 5: A shipment of gold, amounting to 291 ounces, valued at \$2,775, was made on the 2d inst. through Wells, Fargo & Co.'s office at Independence. It belonged to Moreno, Otero & Montana, and came from the Mexican camp, Beveridge district.

BISHOP CREEK.—Quite a little excitement has occurred on Bishop creek over some gold ledges situated about 12 miles east of the town, in the west foothills of the Inyo range.

**NEVADA.**  
STARTER UP.—Grass Valley Union, Mar. 5: Many of the mines in this district, which were being prospected in the early part of the winter, and which looked very promising, were obliged to stop work on account of the great loss of water upon them. Most of them have now started up again, and the chances are favorable for work continuing upon them right along without interruption, and Grass Valley will have more mines working the coming summer than for some years past. The whole outlook of the district is favorable, and it will not be long before some more dividend payers will be added to the list.

SCOTIA MINE.—The Scotia mine, which has been idle for the past few weeks, on account of the great quantity of water in the shaft, and which the small pumps were unable to handle, started up yesterday. Supt. Stoddard will cause a large pump to be placed in the mine immediately, and the work of developing the property will be prosecuted in earnest. Several carloads of heavy machinery are now being shipped from Virginia City, and will arrive in a few days. This company have a fine ledge in the mine, and do not propose to let water get the best of them another season, but will be prepared with large pumps to meet any such emergency. The starting up of the Scotia will give employment to quite a number of men.

THE AMERICAN MINE BLAST.—Transcript, Mar. 3: At 6 o'clock Monday evening a blast of 24,000 lbs. of Judson powder was set off in the American mining company's claims, 1 mile west of San Juan.

MINING CLAIM SOLD.—Eskrine & Craig have sold their possessory title in a quartz claim adjoining the Leecompton and Lackawanna, above the Murchie, to John W. Brodie.

THE SMARTVILLE MINES.—Smartville is one of the liveliest hydraulic mining camps in the State. The Excelsior company are employing 500 men in their claims there, and about 20 more on the company's ranch a few miles below. The Blue Point mine works about 60 men.

THE RACQUET QUARTZ MINE.—County Surveyor Hartwell and Deputy Surveyor Englebright have located 3,000 ft. along a ledge 15 miles northwest of Newtown, and in the same range as the Buelow quartz claim. They call their claim the Racquet. Several shallow shafts have been put down on the ledge, which is from 2 to 3 ft. thick, and the ore found at a depth of 20 ft. assays from \$15 a ton upward. The croppings are on the brow of an abrupt hill, and by running a tunnel in 500 ft. backs of 300 ft. can be obtained. By pushing the tunnel in further, the backs can be increased to 400 ft. The Racquet is a very encouraging prospect, and the owners propose making arrangements to develop it.

THE THRUER MINE.—The combination that some time since was made between the Thuer mine, on Massachusetts hill, Grass Valley township, for \$25,000 from M. C. Taylor, propose to immediately pay up for the mine, although their time is but half expired. They have recently struck a fine 18-inch ledge running north and south from the direction of the old Rocky Bar mine, which bounds the Tribute claim on the north, toward the Ford & Mullen bonanza, which bounds the Tribute on the south. The Tribute mine also lies but a few hundred ft. from the New York and New Rocky Bar mine, and consists of 1,500 ft. of the Black Lead ledge, for which a patent is being issued.

A STAW FOR THE "BEX."—A certain hydraulic mine, not far from here, has just cleaned up \$17,000. Of that amount \$15,000 is paid to Nevada City merchants for supplies of various kinds. Those supplies were mostly purchased from Sacramento dealers, and the retailers will have to repay to the merchants at Sacramento so long as it is to their interests to do so.

NEVADA CITY MINE.—The 3d ledge of the Nevada City mine is producing some high-grade ore. The 2 chutes in south part have been looking exceedingly well for several days, one being heavily charged with sulphurets and the other showing considerable free gold. An equally promising body of ore is just being opened into in the north part of the ledge.

THE JULIA.—Herald, Mar. 5: The Julia mine, situated down Deer creek near the Morrifield, is said to be yielding some good rock. The owners of the property are Wm. Sloan and Phil. Dunn. They are running a tunnel in on the ledge, which has now reached a distance of 200 ft. The width of the ledge is about 1 ft.

THE MURCHIE.—The machinery connecting with the new shaft of the Murchie mine will be started up next week. The shaft has been arrived at the depot, and is awaiting shipment to the mine. It is a steel cable, 2,000 ft. long, and is 3 1/2 inches in diameter. The company likewise sent to San Francisco for 2,400 ft. of Oregon pine lumber, 6x6, to be used for the guides of the cages. It is claimed that it is far superior to sugar pine.

A GOOD CLEAN-UP.—A part clean-up of 27 days' run was made this week at the hydraulic diggings of Messrs. J. C. and W. C. Smith, of Scott's Flat. The yield was between \$2,500 and \$3,000. During the past week the owners have used about 400 inches of water per day. The prospects of this mine are said to be very encouraging. The owners are deservingly of success.

IRON.—Foothill Tidings, Mar. 5: The Iron mine, near the lower line of this county, is assuming large proportions, and will be a great benefit to that rural region by the large number of men employed. The company has expended about \$150,000, and as soon as the road is completed good order for the hauling of charcoal, active smelting operations are expected to begin.

**PLACER.**

RUNNING.—Placer Times, Mar. 3: Mr. J. L. Gould, Superintendent of the Gold Run ditch and mining company, has been here for the last few days, and is at work in his mine, and taking advantage of the large supply of water now in the company's ditch, putting it all to good use.

NEW BLOCKING.—Workmen have been busy the past 10 days laying the tunnel of the Baker mine with new blocking and railroad iron. The iron used in the Franklin mine tunnel has been taken out and placed in the lower end of the Baker mine, for a distance of 1,700 ft. This work of the Baker mine is a fine piece of work, and the tunnel is over half a mile in length, and the cost of blocking must be quite heavy. It is proposed to leave the ironed portion of the flume remain through the season before it is taken out for a clean-up. Trouble has been experienced in washing through the tunnel heretofore, on account of a lack of sufficient grade—the fault of the company, who first cut it. But now it is expected less drawbacks will be met, since the tunnel supply of ironed. Several new powder drills are now being run in the Baker, preparatory to tearing up the banks generally.

CEMENT.—Mr. F. M. Chaboudon, Superintendent of the New Gold Run mine, informs us that the cement mill, erected in that mine last fall, is grinding up cement pretty rapidly. A drift has been run into the cement

bank upon the bedrock a distance of about 100 ft., and has been branched out with a full breast of over 90 ft. The gravel in that whole section is spotted—in some places very rich. It has been some time since hydraulic washing was resumed this season, and the cement mill and hydraulic washing are pushed with vigor. All indications point to a good season's work.

GOOD.—Placer Herald, Mar. 5: The good prospect found in the Herold Webster mine has increased as far as the lode has been uncovered, and that is about 125 ft. The owners are now running a tunnel to tap the lode about 75 ft. below the present surface of the lode. This lode was prospected over 20 years ago, and was then known as the "old man Mason's lode." It was abandoned, and for several years deemed unworthy of notice. About 10 years ago a San Francisco company did some work upon the claim, but owing to the inexperience and utter ignorance of that kind of mining of those having charge of the work, they failed to find the lode, and the ground was again abandoned. It has been since several times since, but no work done until located by the present owners, D. W. Malby and P. W. McCarthy, who went to work early this winter and stripped the lode for over 100 ft. on the surface, and are now opening it in good shape. They found the true lode within 30 ft. of the old works. Now near a miner might come to a fortune and mine it. This mine is located on the trail leading from Michigan Bluff to the W. mine, at Turkey Hill, and about 15 miles from Michigan Bluff.

**PLUMAS.**  
SAVERCOOL.—Greenville Bulletin, Mar. 2: Twenty stamps, or half the mill, are all that are running now, as the weather is so cold, and the ore to the mill during the terrible stormy weather. It has been since the whole 40 stamps will soon be in active operation.

SOUTHERN SKEEN COX.—The pay chimney has just been reached in the new or middle tunnel, and the quality of ore developed is very superior. A large lode of good ore is now being developed in the southeast drift from the main working tunnel. The new mill will be started this spring, and the general outlook of this mine is quite promising.

CHICKOKE.—The mill is doing continuous work. The shaft goes down steadily, being now a little over 100 ft. in depth. A timber shed has been erected adjoining the hoisting works, affording ample room for framing timbers under cover.

PLUMAS NATIONAL.—Mr. C. H. Aaron is making a complete test of the sulphurates at this mine, which thus far has proved to be quite satisfactory. It requires considerable experimenting to get the right heat, as well as the correct proportion of chemicals to be used, and consequently will take a little time to get everything arranged in perfect working order. The visit of Mr. Carter has greatly improved the working of the Frac concentrators.

CROWN MOUNTAIN.—Both mills have been running continuously during the last 18 days of February, with the exception of time lost in cleaning up. The results are proportionately better than ever before. The additional plates placed in the mill a short time since have done some satisfactory work that still another addition has been thought advisable, and the plates are now ready to be placed. In the mine, the contract on the 5th level has been completed, and a raise will shortly be started to open up the main body of pay, connecting with the works in the old incline in No. 4.

DISCOVERY OF COAL.—J. L. Davis, of Bidwell's Bridge, Big Meadows valley, Feb. 26: A discovery of coal was made by the discovery by him of what appears to be a vein of coal. It is estimated in the cut through which the water flows for draining the meadows, about a quarter of a mile beyond Bidwell's Bridge, on the road to Prattville. From his description, we judge it to be the kind known as brown coal, or lignite, as it shows marks of the wood or grass roots in its texture or formation. Mr. Davis is located his claim, and proposes to commence work at once, and ascertain what he has.

**SIERRA.**  
SIERRA CITY.—Mountain Messenger, Mar. 9: Pipe lay was struck in the Blue Gravel tunnel, above Sierra City. The discovery was made by Fine blue quartz gravel is near three-quarters up the face of the tunnel, which is prospecting favorably with gold. Length of tunnel, 300 ft., through mostly cement gravel. Ground rather dry and somewhat difficult to work, requiring occasional blasts of Giant powder.

**TUOLUMNE.**  
POCKET CLAIM.—The Edith pocket claim, about 2 miles northeast of Golden City, and owned by John E. Carne, prospects well in free gold; pieces to the value of 75 cents and \$1 to the pan. Three men are at work building dams, preparatory to sluicing off the gulch to follow up the pocket.

ED. T. FRANK, Superintendent of the Soulsbyville reduction works, has gone to the new gold fields in Alaska.

MR. W. C. HOLMES, of Brown's flat, is reported to have taken up a pocket some time last week.

## NEVADA.

**WASHOE DISTRICT.**  
BULLION.—Virginia City Enterprise, Mar. 8: Crosscut No. 1, 2,450 level, 100 ft. south of the shaft, is in 15 ft., and has its face in quartz giving low assays. The crosscut struck on the surface on this level is 8 ft. and has in its face stringers of quartz and porphyry, and is not yet through the west wall of the vein. The north drill hole on this level has been run a distance of 150 ft. and stopped in quartz.

BELCHER.—The southwest drift has been run and timbered 33 ft. during the week. Have commenced clearing out a west drift on the 400 level. The work of putting the traps on the surface has been completed at 1 o'clock Tuesday. Repairing the 300 and 1000 bob station will be completed in a few days. The pumps are running well and keeping the water below the 2100 level, as usual.

CALDONIA.—The pumps have been run an average of 18 hours per day, burning an average of 7 cords of wood per day. At the Foran shaft the station for the 1700 pump is completed, and the bearers for the pump are in place. We will commence putting the pump in place this evening. The Suto tunnel drift has been extended 33 ft.; total length, 116 ft.

OVERMAN.—The station for the 1700 pump has been completed, and the bearers for the pump are in place. We will commence putting the pump in place this evening, and will complete the balance-bob station to-day.

C. N. S. SHAFT.—Putting in the pumps at the 2400 level, and raising water to the 2100 level, the 3 room partitions, as the Hale & Norcross yesterday broke a rocking shaft of one of its bobs, and was compelled to stop pumping.

G. & C. AND B. & B. SHAFT.—Working on bob-bits Nos. 1, 4 and 5. No. 5 will be completed this week. Everything below the Suto tunnel level is ready for starting up level dry, and keeping it dry.

YELLOW JACKET.—We have extended the Suto tunnel level 54 ft. during the past week, making the present length of the same 554 ft. from the switch, or 627 ft. from a point 80 ft. east of the shaft. The drift is now in the Challenge company's ground.

SILVER HILL.—Work on our 900 level bulkhead is progressing favorably, and will finish up without a doubt, be solid and tight. No other work can be done in the mine until that is completed. The pump is handling the water easily and at reduced expense.

ALTA.—The shaft has been sunk and timbered 25 ft.; total depth, 1,800 ft.

UNION CON.—On the 2500 level the joint Mexican east crosscut has been extended 25 ft. Cutting out chamber for water in joint Sierra Nevada east crosscut.

MEXICAN.—On the 2500 level the joint Union Con. east crosscut has been extended 25 ft.

ONIR.—On the 2500 level the joint California east crosscut has been extended 36 ft. Cutting out station at 2700 level at bottom of joint Mexican vein.

C. & C. SHAFT.—At the C. & C. joint shaft are cutting

out a bob station at the 2100 level. The shaft has been sunk 8 ft.; total depth below the 2500 level, 13 ft.

HALL & NORCROSS.—The pumps were started up yesterday. All the machinery is working well.

CALDONIA.—During the past week 63 tons of ore, assaying \$53.23, have been extracted. The joint Ophir east crosscut, 2500 level, has been extended 36 ft.; the joint Con. Virginia west drift to the C. & C. shaft has been advanced 33 ft.

SIERRA NEVADA.—During the week 215 tons of ore were extracted. A shipment of bullion amounting to \$40,355.53 was made.

CUN. VIRGINIA.—During the past week 63 tons of ore, assaying \$47.65, have been extracted. On the 2500 level the joint Best & Bolcher raise has been extended 12 ft., and west crosscut No. 1 extended 17 ft. On the 2500 level the joint California west crosscut has been advanced 33 ft., and the south drift 20 ft. During the week \$5,413.15 in bullion was shipped.

SOUTH LATERAL.—The ground passed through last week was mostly decomposed andesite, with frequent clay seams. It was heavy ground, and requires to be cased and additional timbers set in. The repairmen working near the carriage stand have timbered 52 ft. of ground, and a portion of the repairmen have been engaged doubling up timbers near the face and repairing the track. The header is now 400 ft. in Imperial ground, and 10 ft. from the Jacks shaft. Total distance of south drift from the Julia connection, 3,749 ft. Flow of water from the mouth of the tunnel in standard gallons, 3,350,000.

**BRADSHAW DISTRICT.**

MONITOR ORE.—Silver State, Mar. 2: James H. Sackett, District Recorder at Silver Lake, took about 10 miles northwest from Winnemucca, called yesterday and showed us several very fine specimens of galena ore from the Monitor ledge. This is considered the best claim in the district, although there are others which may prove as good, or even better, when the same amount of work has been done on them. The Monitor is being prospected by a shaft, which is now down about 40 ft. At the bottom of the shaft, the ledge is 3 1/2 ft. wide, and carries about 18 inches of the ore above mentioned. A number of working tests made of this ore, in large and small quantities, show it to be worth from \$47 to \$220 per ton in silver, an average of about \$5.50 in gold, and about 15% lead. The district is adjoining the old Silver State district on the south, and is tolerably well supplied with wood and water.

**CANDELARIA DISTRICT.**

AT WORK.—True Future, Feb. 26: There is quite a number of men, scattered over the hills in this district, who are doing a little work on their locations. Some are going down with shafts on small stringers of ore, and others are doing more pretentious work, and are sinking with the intention of cutting the State, which a little capital would in a short time convert into a bullion-producing properties. As our mines go down, the ore increases in quantity and richness, and the veins everywhere are true fissures. We think that our district has passed its stagnant period. In a month or so every idle man in our town, who wants work, will be employed.

**CHERRY CREEK DISTRICT.**

OUTLOOK.—News, Mar. 2: The outlook for the future of Cherry Creek is brighter to-day than at any time since the district was discovered. When spring fairly opens, and work in the various mines of the district resumed, we shall hear but little of our miners going off to Arizona, New Mexico, and other remote sections in search of what we have at home. Old miners in this district well know that there are not, within a radius of 3 miles, in the mineral belt back of Cherry Creek, 6 or 8 as good mines as can be found anywhere in the State, which a little capital would in a short time convert into a bullion-producing properties. As our mines go down, the ore increases in quantity and richness, and the veins everywhere are true fissures. We think that our district has passed its stagnant period. In a month or so every idle man in our town, who wants work, will be employed.

**REBEL CREEK DISTRICT.**

TO BE WORKED.—Silver State, Mar. 1: From Charles Bernard we learn that work will soon be commenced on several mining claims in Rebel Creek district, one of his own among the number. There are some good mines in that district, and with a reasonable amount of prospecting, some good developments may be looked for during the coming summer.

**WARD DISTRICT.**

ORE.—Reflex, Feb. 26: A small body of ore was struck in the 3220-ft. crosscut, in the Martin White tunnel, Thursday night. Mr. Settepaup is of the opinion that the ore found in the footwall, which is going ahead in the 2000-ft. crosscut, from which a drift is being run to the 3220-ft. crosscut.

## ARIZONA.

MULE MOUNTAINS.—Tombstone Nugget, Mar. 6: Every day we receive encouraging news from the Mule mountains. All mining operations in the district have been successful, and even prospectors are eagerly sought for. Although the result of developments in the district already exceeded the expectations of the most sanguine, there is now a sale on the tapis that, if it comes off, will do much towards boosting up the camp and making it as prominent for the production of silver as it now is for the production of copper. We refer to the purchase now being negotiated for Silver Lake, the mine at the Elk, Minnie and Daisy. All these mines are on the southwest slope of the Mule mountains, running with each other, except the Oak Grove, which is an extension of the Mountain King. They crop out boldly, and assays from the croppings are very satisfactory, going from \$35 to \$164 per ton. But little work has been done on any of the mines, 20 ft. being the greatest depth attained; yet we are pleased to know that the work done has encouraged the proprietors. Mr. James Gray, formerly of Phoenix, is the principal owner.

## IDAHO.

BASE OF MOUNT ESTES.—Yankee Fork Herald, Feb. 26: There are several parties prospecting and doing assessment work around the base of Mount Estes. Harry Merritt and Charlie Lambert are running a tunnel to the Michigan ledge, situated near the forks of Jordan. They are in 75 ft. and have crossed several streaks of quartz, one of which is 3 ft. in width and contains considerable ore that carries more or less sulphurates of silver and some gold. The main ledge, which is 10 or 12 ft. in width, will be reached in a farther distance of about 10 ft. Lanyon & Moore are sinking on the Butcher Boy and down about 70 ft. in a ledge of medium quartz, carrying both silver and gold. Alec Robinson and Lee Dorsey are sinking on the Golden Gate. Cal. Clawson is running a single-banded tunnel to the slide under the Montana, in search of rich float, diamonds and precious stones and metals generally. Allison & Jamison are running a bedrock drain in right bank fork of Jordan with a view of thoroughly prospecting the gulch. The snow up Jordan is 4 ft. deep. The journeying to and from Mount Estes is made on snowshoes, and the road up Jordan is a hard one to travel.

CUSTER.—The owners of the Lemhi mine are pushing their tunnel ahead with all speed, and have only about 100 ft. more to run before striking the ledge. The tunnel will tap the ledge about 130 ft. below the surface. The country rock through which the tunnel runs is similar in every respect to that encountered in running for the Charles Dickens ledge, about half a mile southwest of Lemhi. It is the theory of the old timers that the rich belt of mineral in which Charles Dickens, Gen. Custer and Unknown mines are located, has been cut by the Yankee Fork river, and that subsequent developments will prove this theory correct, the Lemhi being the last location between the river and the northeastern extension of the belt in which the Dickens is located. Work on the same mine undoubtedly demonstrate the correctness or falsity of the opinions now entertained by the old timers that the Yankee Fork has cut in twain this mineral belt, and that the Custer and Unknown mines, together with a large number of mines on the northeast side of the Yankee Fork, and the Charles Dickens, the Lemhi and other prominent mines on the opposite side of the river, are on the same mineral belt. There is a move on foot by the miners and others in the employ of the Custer Co. to create a hospital fund

by each member contributing from \$1.50 to \$2 per month. Private letters are received by parties here from many sections about Yankee Fork the coming season and Wm. Wakefield, an old pioneer of California, and a close observer of matters that tend to make up a lively mining camp, gives it as his candid opinion, and so advises his friends, that he knows of no camp on the coast that presents a better opportunity of making money than right here in the Yankee Fork. Owing to the extreme winter he thinks that the 1st of May is early enough to start for this country, and so advises his many correspondents.

## MONTANA.

CATACT MINES.—Herald Independent, Feb. 26: Anderson & McKilligan's new "pony" quartz mill has started up. The extreme cold weather has not prevented them from pushing forward their enterprise, and a concentrator only remains to be added to complete the mill ready for work. This is in most respects a new enterprise, as only one stamp is employed, and it is driven by steam which is applied directly to the upper end of the stamp stem, giving it a rapidly reciprocating vertical movement of several hundred strokes per minute. The proprietors claim that they can reduce 10 tons of ore per day, and if such facts are verified by actual tests here, I have no doubt it will work a great change in quartz mill building. I am informed by Major Thornton that the Boulder M. Co. will proceed immediately to sinking a shaft 300 ft. deep. A considerable amount of work has been done during the winter on various locations in this vicinity with encouraging results, and as soon as the snow takes its departure our camp will spring up with renewed energy and life.

THE ALTA MONTANA CO.—The ore product of this company for the first 10 days of January amounted to 150 tons, as last reported by us. From the 11th to the 31st, 30 days inclusive, the product sent to the mill from the Alta, amounted to 311 tons of the first class ore, the average value of which was 1204 ounces silver per ton. The lowest assay was of a 15 ton lot carrying 50 ounces silver and 44% lead a ton; and the highest, a 40 ton lot which had 104 ounces silver and 00% lead to the ton. Despite the severity of the winter this company has made and is making real progress.

IRON ORE, from the new discovery near the works, to the amount of 6 tons, is daily delivered at the smelter. Thus far the vein seems to be six ft. wide and is entirely free from sulphur.

THE Lexington, of Butte, is increasing in value rapidly. In making exploration where some stringers of ore led off from the main chute toward where the footwall was supposed to be, he found an entirely new pay chute 7 ft. wide, which added to the 10 ft. along the hanging wall aggregates 16 ft. of pay—solid and rich. The new strike is 110 ft. below the surface and is opened for about 100 ft. along the vein. A shaft on this mine, now 140 ft. deep, will be continued to a depth of 500 ft. One crosscut will be made when 300 ft. down and another at the bottom, and afterwards levels run at every 100 ft. Then will follow a chloridizing mill in which to treat the base ore, while the old one continues to work on the free. Judge Davis expects to have run through his mill before July of this year, over 20,000 tons of ore from the Lexington since he began to work it 4 years ago.

THE GREGORY.—This mine is located in Jefferson county, about 2 1/2 miles from the works of the Alta Montana, and is one of the oldest worked in this region. Formerly there were two companies on this property, each owning 800 ft., but late in the autumn of last year they were united under one management, and extensive reduction works were soon set in operation on the rapidly accumulating ore product. The ore, which is abundant everywhere in the mine, carries from 75 to 100 ounces of silver, 45% to 80% lead and from 1/2 an ounce to 2 ounces per ton in gold, the gold being associated with the iron pyrites and the silver with the galena. A wet concentrator will be employed on the large dump which has been accumulating at the Con. Gregory for many years, and estimated at nearly 5,000 tons of ore.

PHILLIPSBURG.—Cor. News Northwest, Feb. 25: The Granite Mountain mine, recently sold for \$40,000, continues to develop finely. The upper tunnel is in 168 ft. on the lead, which runs west to east. Below a shaft is sunk 85 ft. on the face of the lead, which dips south at an angle of 35°, and only 22 ft. more are required to tap the lower tunnel, now in 205 ft. It is not improbable that by next fall 400 tons will be crushing ore from this ledge. The 600 ft. tunnel run to the Cable mine was tapped by the shaft at the steam hoisting works last week, and soon the 20-stamp Nolan mill, so long idle, will be dropping on ore from this famous mine. It might be well to say here that quite a number of miners have arrived in Phillipsburg lately, and that the labor market is well stocked. But the prospects for the coming season are good.

LEXINGTON.—Butte Miner, Mar. 1: The mining sensation, most freely the theme of conversation and discussion for several days past, is Davis' Lexington mine. The Lexington has always been rated a big mine. From its opening it has paid largely, and its pay chute has been drifted and worked for over 1,000 ft. without a barren spot being met with on the vein. The ore is taken from the workings in the east level, distant from the shaft nearly a mile. The rich ore vein, as far as exposed, has the appearance of being a new zone, and it is fully 5 ft. wide, without any indications of pinching. Silver in its purity is plainly discernible in much of the ore hoisted out daily. The daily output is about 17 tons.

ALICE.—Everything is running nicely at the Alice. No new developments are reported, but all the ore faces and bodies of ore present their customary fine appearance. About 10 tons of ore of good quality are hoisted daily. At the 700 level of the Alice a larger volume of water was temporarily encountered lately, but it abated without calling into requisition the full capacity of the pump, and it is now under easy control.

BELL.—The Bell is showing well in all its workings. The drifts continue to develop rich ore, and the supply of exhaustible supply of ore is already developing in the Bell and ore extraction is daily added to as the drifts run upon and open this remarkable vein.

BELLE OF BUTTE.—Messrs. Roubush & Young are engaged opening and working the Belle of Butte lode, which is situated immediately south of east of the Alice. A main shaft is down to a depth of about 85 ft. on the vein. At this depth levels are being run east and west on a good sized vein of paying ore. The ore is coming out assays from 60 to 80 ounces per ton in silver.

NOTES.—The Diamond is idle, but the dump pile at this mine is being cleaned and baled to the Dexter mill for crushing. The Colusa is in full blast with an ore product that must average nearly 50 tons per day. The Gargon yields its daily output of rich ore without material variation.

## OREGON.

CLEAN UPS.—Sentinel, Feb. 20: Lackland, of the Star Gulch hydraulic mines, made a good clean-up yesterday, but we have not been able to learn the amount taken out yet. Byboe & Hawket cleaned up after a run of 9 days in their Waldo mine, realizing \$1,600. It is expected that their water will last 3 months yet.

The Starling pipes are playing on very rich ground, and we are informed by a gentleman, who visited the mine lately, that the bedrock is literally yellow with gold.

## UTAH.

THE HICKORY.—Times, Feb. 26: A 6-ft. body of high-grade ore is now exposed, and an improvement is noticeable as depth is attained.

HORN SILVER.—This week's bullion shipment foots up 10 carloads. Mr. Byram is continuing his experiments at the smelter, and apparently with favorable results. The company have, during the week, purchased undeveloped property near the mine.

THE SPOON.—A fine body of ore was struck in this mine on Monday last. The Spoon lies not far from the Horn mine, and is supposed to be on the same ledge. The strike was made at the bottom of the 00-ft. shaft, and the owners, Messrs. Campbell, Burke & Lane, B. B. Brown, now have 10 tons of ore on the dump, which carries an average of 50 ounces silver and 40% lead. The ledge matter, 21 ft. in width, lies between walls of lime and porphyry.

## Mining Litigation.

¶ R. J. Kohler has entered suit in the Superior Court against Robert Watson and Samuel Corwin to recover \$10,000 damages for breach of contract.

Plaintiff and defendants entered into an agreement, whereby defendant Watson was to pay to plaintiff the sum of \$5,000, and defendant Corwin, \$2,500, and the three were to run the Kohler Reduction Works at Melrose, Alameda county. The defendants, after signing the contract, refused to pay the sums as above, and plaintiff prays damages.

Augustus J. Bowie, Jr., has brought suit against Archibald Borland for an accounting of alleged copartnership in the Gopher Con. Mining Co., and for a dissolution of the partnership. The complaint sets forth that in the spring of 1879 plaintiff became acquainted with the Gopher and Golden Terry mines, situated at Bobtail gulch, Lawrence county, D. T. He then entered into a partnership with defendant in a speculation to buy the mines and organize the Gopher Con. Defendant was to advance the necessary money for the purchase of the above mines, and plaintiff was to negotiate the purchase and carry through certain litigation then pending, and to sell the capital stock. According to the complaint a partnership was formed on the 23d of April, 1879, and the next month the minns were purchased for \$117,000, toward which the defendant advanced \$40,000, and took the title in his name. In the course of the speculation 10,000 shares of the stock were transferred to George Purmort. By March, 1880, they had sold 34,870 shares of the stock for a net sum of \$99,700, which sum was applied in payment of the purchase money. In May, 1880, the defendant repudiated the partnership agreement and refused to recognize the plaintiff's rights themselves. Since that time defendant has sold all the balance of the stock, and converted the proceeds to his own use.

The Jupiter vs. Bodie Mining Co.'s case is on trial in the U. S. Circuit Court. The suit is one of the most important that has arisen from the clashing of titles in Mono county, Messrs. Ralston and Yerington, who control the Jupiter Co., are the real plaintiffs, with D. O. Mills as an interested but silent partner. Cause of action was furnished by the Bodie Co. extending its explorations into the property claimed by the Jupiter Co. This property of the Jupiter Co. includes four locations—the Savage, East Savage, Riordan and Daily claims—representing in the aggregate 1,500 ft. by 330 ft. The Bodie Co. has run several drifts into this property claimed by the Jupiter, and struck a valuable ledge at a depth not yet attained by the Jupiter Co.'s workings. It is alleged that much if not all of the ore extracted by the Bodie Co. is coming from the Jupiter ground, and damages to the amount of \$5,000 are therefore claimed. The damages, however, are the smallest consideration in the suit. The real object is to quiet the title of the Bodie Co. to all the ground owned by the Jupiter Co. and some more.

The Bodie Co. claims that it obtained a conveyance of this disputed ground from former locators, who called the claim the Lucky Jack. The Lucky Jack was located May 26, 1875, by T. J. Fouse and C. E. Lewis. In June, 1877, the Lucky Jack was relocated under the name of the Savage, by Davis, Ireton, Lee and Gibbons. On the 21st of July, 1879, the Bodie Mining Co. obtained a conveyance of the Lucky Jack claim, 1,500x600 ft., through the original locators. Acting under authority of its conveyance the Bodie Co. has since treated the Jupiter claim as its own. It has explored it underground and occupied it overground. To this connection the Jupiter Co. objects on the ground that the Lucky Jack claim was never properly located, and therefore could not have been conveyed by the original locators. The claim was invalid, the Jupiter Co. says, because the Lucky Jack claim was 1,500 ft. by 1,600 ft.; whereas, the law of the district provided that the width of the claim should have been only 100 ft. In the second place, because the claim was not staked off properly, only one stake having been driven to indicate the north boundary. In the third place, because Fouse and Lewis, the locators of the claim, voluntarily abandoned it. In the fourth place, because no assessment work was done on the claim for 17 months, beginning with April, 1877. The allegation that the claim was not properly staked off appears to be the most serious, and the efforts of counsel on both sides are directed to that point.

**TESTING DRAIN PIPES.**—A writer in the *Ironmonger*, from long practical experience in testing drain pipes, confidently recommends for that purpose what he terms a "smoke test," and which gives evidence as to leaks both to the sight and smell. The materials that he employs are soiled cotton waste and sulphur, the smoke from which, after ignition, is blown into the drain or pipes. If leakages exist in the latter inside of the house, the smoke and smell both issue forth and show that something is wrong, and generally tell also just where the fault or faults are. Sulphur, as well known, is one of the best of disinfectants, and a dose of the fumes from this to the drains, after disease has been in a house, would effect much good.

A SALT LAKE gentleman blew up one of the old smelting furnaces at Oreana recently, and got five or six thousand dollars' worth of bullion out of the ruins.

## Raisin Making in California.

In the report of the Viticultural Commission lately issued there is a brief review of raisin making in this State, by R. B. Blowers, Commissioner of the Sacramento district.

Raisins are made from the Muscatel Gordo Blanco and Muscat of Alexandria, preferably of the former, also a seedless raisin, highly esteemed, made from the seedless Sultan. The grape should be allowed to remain on the vine until quite ripe, showing a yellowish or golden color and being more translucent than when too green. Then they should be carefully picked and placed upon a drying tray (usually two by three feet in size), then exposed with an inclination toward the sun in some convenient place, generally between the rows in the vineyard or in some contiguous open land. After having been exposed a sufficient time to become about half dried, they are turned once in this manner, viz: two workmen taking an empty tray, place it upon a full one, holding them together firmly, and with a swinging motion turn them over and replace the now turned grapes in their former position. The turning should be done before the dew is quite off the grapes in early morning; then when the grapes have become so dry as to lose their ashy appearance, some being a little too green, and some quite dry enough, they are, after removing those entirely too green, elid from the tray into large sweat boxes, having a thick sheet of paper between about every 25 or 30 pounds of raisins, then are removed to the store-room, where they should remain two weeks or more. When ready to pack it will be found that the two moist ones have parted with their surplus moisture which has been absorbed by the stems and drier raisins. The stems are now tough and the raisins soft and ready to pack. They are carefully placed in packing frames made of iron or steel. The large and fair ones being placed carefully in the bottom of the frames, the surplus stems and imperfect berries cut away, then the average raisins are arranged in and weighed, placing five pounds in each frame, then pressed enough to make them firm in the frame, but not enough to break the skin. They are then passed to an inspector who examines the exposed side of the raisins, removing any imperfect ones, then placing the wrapper paper on the frame, holds it in place with a wooden or steel plate, turns it bottom up, drops the left end into the box, slides the plate quickly from under the frame and it drops into the box, then pressing slightly upon the moveable bottom of the frame, the frame is removed, the bottom of the frame is then pressed more firmly to cause the raisins to fill the space formerly occupied by the sides and ends of the frame; then it is removed and the face of the latter is exposed, all imperfect berries or too wet ones are removed and all vacancies or hollows filled by large, loose raisins. The label of the proprietor is then placed on the face; the ends of the wrapper, and then the sides are folded over, the box cover nailed on, and they are ready for market.

Many hundred tons of shipping grapes are sent East from this district to all principal markets in the United States. The Emperor, Tokay, Black Morocco and the Muscat family are most liked for the Eastern market.

Irrigation is a very important factor in the success of the fruit grower, but if the situation is good in other respects, and no ditch water can be secured, it is found that in many parts of the State an unfailing supply lies but a small way beneath the surface in gravel ridges. Former water courses having been filled with gravel, the surface stream diverted sometimes many miles away, leave quite a large flow of water in the gravel. This being tapped by a well the only equipment needed is a straw-burner engine and rotary pump, and 100 or more acres can be irrigated with economy, insuring a good profit and a pleasant home.

In an experiment made recently in Yolo county, after having submerged the entire vineyard for nearly two weeks, each a well being on the place, the ditch water was shut off from 20 acres of the vineyard, and while the water still covered the entire surface to the extent of over 19 acres, the pump was run five hours, supplying the seepage and raising the water five-eighths of an inch over the entire surface, showing that in 24 hours three inches in excess of the seepage could be added to 19 acres after the ground had been saturated.

Cost of planting and cultivating, irrigating, labor, subsistence, etc., including total expense for first year, is from \$20 to \$25 per acre, if thoroughly well done; second year, \$15 to \$20; third year, many varieties, if well cared for, yield a profit; if not well attended to it may take a year or two longer. Nothing pays better than care, and nothing loses more surely than negligence in vine growing. In pruning, the habit of each variety grown should be closely studied. In grafting, great care should be taken to choose stock with wood of similar growth; if the variety desired is a coarse wood and large grower, a similar stock should be selected; if wood is of fine texture and slow growth, a wood of fine texture should be selected as grafting stock.

GLASS manufacture is making rapid strides in Ohio. Last year there were five new works erected, and this year there will probably be as many more. There are 19 firms in the State engaged in the manufacture, which employ over 2,000 men.

## Geological Survey Work.

The U. S. Geological Survey, under Mr. Clarence King, is doing a good work in the collection of facts concerning the mining industry of the coast. They have taken three great central points—Leadville, Colorado, and the Comstock and Eureka districts, Nevada, and have worked them up thoroughly. At these places they will find a large mass of material ready to hand. The appliances of mining, methods of working the mines, metallurgical processes, etc., are all being worked up. The topography and geology of the sections receive special attention.

We had an opportunity this week of examining the very fine map of Eureka district, made by Frederick A. Clark, of the Survey, from data gathered by over a year's work of the party. The map itself is in great detail, and on a scale of six inches to the mile. The map is 9 7-10 ft. square, and represents an area 20 miles square, or 400 square miles. It includes the location of the Richmond and other celebrated mines, with the town of Eureka and its approaches and surroundings. The map is as correct as science can make it.

The contours are 50 ft.; that is, in surveying the country represented, its form for every 50 ft. of perpendicular height was ascertained. The lowest a titude measured was 6,150 ft., and the highest 10,637, making over 4,500 ft. in vertical height, which was divided into 90 horizontal planes 50 ft. thick. The outlines of the base of each of these planes is represented upon the map, thus showing the exact topography of the entire country, the canyons, hills, peaks, slopes and mountains. Every stream and spring, every road and tract, every mine of any importance is laid down. It took 16 months' work on this field to obtain data for the construction of the map. It took five men one month of constant work from 5 o'clock A. M. to 11 and 12 P. M. each day to make the drawing. The map is made on a scale of 1 to 10,000, or about six inches to the mile. It is for the Geological Survey, and upon it will be designated the geological formations found in that section of Nevada. The geological coloring will be done by another party, the data having all been collected.

This map will be lithographed in sections and published. Owing to the scale upon which it is made, the geology can be worked up very closely, for which reason, in fact, it was made so large. The map has been sent on to Washington.

## Silver Bell District, Arizona.

This new mining district located about 40 miles northwest of Tucson, near Red Rock station on the Southern Pacific railroad, is coming into great prominence for the extent and great richness of its mines.

The Old Boot, Blue Coat and Copper King mines have each been developed sufficiently to warrant the erection of a 30-ton smelter, and from the character of the ores, a repetition of the successes of Bisbee is anticipated. These three mines are the property of the Huachuca Mining Co., organized under the laws of the State of New York, Guy R. Pelton, as President, R. Danneheim as Secretary, and Z. Staab as Treasurer. Mr. W. B. Scott, Superintendent of the company's mines, has already started to San Francisco to purchase a smelter, which will be put in operation as soon as it is possible to erect it. The ore, a red oxide of copper, carrying considerable iron, is it thought will be easily smelted with the natural flux contained therein.

A new town has been started in the district called Pelton, and a store opened. The district, it is said, comprises an immense number of very rich ledges, all carrying more or less silver.—*Citizen*.

## San Pedro District, Arizona.

Mr. W. F. Peabody was in town to-day from the San Pedro mining district, which comprises a section of mineral country at the confluence of the San Pedro and Gila rivers, about 40 miles from Casa Grande. This district, from the exceeding richness of its mines, is destined to excite a great deal of attention. Mr. Peabody has some of the most beautiful specimens of ore we have ever seen, taken from the Walston mine, owned by himself and J. S. Walston. They are not only beautiful, but rich in silver almost beyond computation. Mr. Peabody has just shipped to San Francisco, for a working test, about 800 lbs. of ore taken from a depth of 50 ft. which assays an average of \$1,500 per ton. An 18-inch streak of this mineral occurs in an eight-foot ledge of quartz that assays over \$50 per ton. Messrs. Peabody & Walston have a veritable bonanza in their mine, and fully deserve their good fortune for their perseverance and industry.—*Citizen*.

**THE CHLORIDING BOOM.**—A number of miners formerly in the employ of the Stormont company are now chloriding in the different mines on the East and White reefs, all sanguine of making their \$4 per day. Six are at work on the Vanderbilt mine, and judging from the looks of the ore and the quantity they have extracted already, big wages will be their reward. Chloriders are also doing remarkably well on the Toquerville, Duffin and Spillsbury mines.—*Silver Reef Miner*.

## Stopping the Leadville Mines.

The mining interests of Colorado have ever had a good deal to contend with. They have had the obstacles of nature and the cussedness of mankind to fight. First there were serious disadvantages of situation to struggle against. A wide expanse of barren plain stretched away eastward from the mines, to retard the transportation of machinery and to discourage capital. The waters flowed into the deep shafts, to dampen enthusiasm and drown out energy and effort. The mine jumper came along to create a scene of insecurity, to interfere with work and to generally distract and hinder. The legal claimant appeared with his suits of ouster and his injunctions to weary and to worry. Then the designing demagogue came along to excite to strikes, to interfere with work and to stop the golden yield.

But over all these things the miners have, in a large measure, triumphed. The power of steam, with its smooth, iron roadway, and its fleet tireless messengers, has placed the mines adjacent to the smelter, the foundry and the money center. The same power, its swift energies directed in another way, has cleared the shafts of water. The mine jumper hangs harmless from the convenient branch of the adjacent tree. The litigant has, in a measure, been sat down upon by the courts and by public opinion.

The meddlesome demagogue has been suppressed by the strong hand of executive power. No sooner, however, have these triumphs been scored and the mining interests apparently secured a clear field for expansion and development, than a new and harassing enemy appears in the form of the authority of the law. The County Commissioners of Lake county have levied upon all the personal property of the Little Pittsburg, including machinery and cord wood, for the purpose of enforcing collection of the tax levied upon the net income. This, of course, has stopped all operations and thrown all the miners employed on the property—nearly 200 in number—out of work. The development of the rich ore body just discovered is indefinitely postponed. Similar proceedings are threatened against all the mines. The inevitable result of all this will be the indefinite suspension of mining operations, the enforced idleness of thousands of men, the stagnation of business in the second city of the State, serious damage to business generally, and disorder, violence and crime. An unemployed laboring population, agitated by the fears of want, inflamed by a sense of wrong, and, perchance, goaded by the torments of poverty, cannot be kept quiet and cannot long be restrained from excesses.

The action of the Lake county Commissioners is thus a mad, reckless blow, not only at the business interests of Leadville and of Colorado, but also at the peace, safety and lives of the people. It endangers everything. It has evidently been taken in the expectation of forcing the mining companies to terms, and, therefore, is only a piece of passionate, desperate intimidation and bluffing. Such a proceeding is as foolish as it is wicked. It is as unworthy of sensible officers of the law as it would be of christian, provident citizens. Laws are not enforced by such means. The Commissioners cannot expect to collect the tax through their levy. The assessment against the Little Pittsburg is over \$50,000, and the Commissioners have seized nothing that they can sell for any such amount; therefore they can expect nothing but to force the company to terms.

There is a serious question as to how the tax justly levied upon the net product of the mines, owned in part by foreign stockholders, is to be collected. A test case to settle this question could have been raised by levying on a portion of the company's property, and without this sweeping seizure that disarranges business, disturbs the peace of the community and endangers life. The question must ultimately be settled by such a test case, so the present violent proceeding will have no effect except to do the great injury and harm to the people already indicated. Nothing but evil will result.

It seems a little hard that the mining interests of Leadville, after having overcome the disadvantages of situation, after having fought down the jumper and the striker, and after having suppressed the litigant, should now have the authorities to overcome. Only interests of wonderful power, resource and vitality could have prevailed over so much; and they will doubtless be able to triumph over the new enemy.

Lake county, ever since it has come into prominence through the marvelous carbonates discoveries, seems to have been blessed with a set of County Commissioners whose sole object in life has been to see how much injury they could inflict upon the people and how much general wickedness they could perpetrate. It is to be hoped that their last performance will prove to be the sublime atrocity, the final exasperation that will arouse a popular resentment, which will bring them to their senses or suppress them altogether.—*Denver Republican*.

A LETTER from Tombstone, Arizona, says: There are 60 saloons here, and 10 faro games, besides chuck-a-luck, percentage poker and the like. The gambling houses are crowded from morning to night.

EIGHTY miles south of Winnemucca, Nev., in what is known as Bolivia district, copper and iron ores abound, but they are worthless now, and will remain so until a railroad is built through that section.

## Forests or Floods.

The yearly destruction of forests by legitimate enterprise will in a short time leave us without any woods. But the waste of careless lumbermen, tannin seekers and the fire fiend must bring us almost immediately to the condition of degenerate Turkey, Persia and Spain. Forests in the southern part of the State are already much less than the prescribed fifth of the territory, and we cannot afford to lose another bush. Fire is responsible for more floods than anything, except water. When a forest is burned, not only the trees, and shrubs, and bushes, which would escape the lumbermen, but the moss and grass are also destroyed. These and the roots hold the soil on the mountains and steep places, and it is this top spongy soil together with the leaves of trees, mold and brush which hold the rain or retard its progress to the earth. So a mountain or ravine covered with woods with a given rainfall, will supply the springs which drain it during the entire year. Denude this locality of its timber and there will be an excess of water at one season, and none at all at another. In the first case, the rain must come to the earth slowly; and once there it finds a loose mold to absorb it, leaves, and roots, and brush to obstruct it; so that it has time to find its way into the veins and fissures which make the springs. In the other case the rain comes down directly on the soil; that part which is soft and might absorb the water is washed away, and the hard surface of the mountain turns the whole rain into turbulent torrents to the lowlands, and in the summer there are no springs and no brooks. Thus, the destruction of forests by leaving nothing to give moisture to the air when there is no rain, gives us not only seasons of flood and drouth, but also greater extremes of temperature, for moisture is the great equalizer of temperature, as those know who may have lived upon islands.

The misuse of fire is the curse of California. At the end of the dry season, when everything is like tinder, the California farmer will find something to burn; rubbish, straw, stubble, or, worst of all, he will undertake to clear some land by setting fire to it. From August to November there is probably not a day but what a fire runs away from its originator in some part of the State and does more or less damage. What shall we do to stop it? We can gather some information from other countries. All through Europe there are officers whose only duty it is to watch and preserve the forests. In many of the principal civilized States there exist regular schools of forestry in which young men are educated in everything pertaining to trees; such subjects, for instance, as the rainfall as affected by trees, preservation of mountain sides, prevention of too rapid draining of water by plantation where the water sheds are very steep, etc.

One of the axioms laid down is that one-fifth part of any territory 100 miles square should be in forest, if that territory is to produce the maximum returns of which it is capable. That amount of forest has been demonstrated over and over again to be the least which a territory should have. Forests prevent drouths and extremes of temperature. France, Germany and Austria maintain this proportion, as do other countries. In Germany the system is followed of utilizing the woods directly by cutting one-third of the State forests every year so that in 30 years the whole forest is cut down, but is still always growing and always a forest.

Another axiom is that all mountain slopes having an angle of 45 degrees, or greater, when not covered with grass should be covered with trees. In Switzerland, since the government has adopted this principle, and planted trees in exposed localities, and prevented the clearing of other such situations, land slides and floods have become much less common than formerly. In France, by the intelligent plantation of trees they have reclaimed extensive tracts of desert and partially arid tracts. The most notable instance is the reclamation of the "Landes" (formerly a sandy desert to the south of Bordeaux) by gradually setting out pines in it, which, very much to the surprise of most people, have taken root and grown until now the entire section is inhabited, cultivated or in forest. This forest brings in a good revenue to the government, and the taxes the inhabitants now pay make the investment a good one.

In France the government is now giving a great deal of attention to tracts of private mountain lands which have been denuded of trees and turned, as far as they were capable of it, into sheep pastures. Extensive floods, some of them very disastrous, have taken place since this change, and the government has now set to work to replant these tracts with a view to so hold the rainfall as to diminish the floods prevalent under the present conditions. Some of the nurseries established to carry out the plan are to furnish 300,000 trees each year. How much easier to have kept the old woods!

"HONEST JOURNALISM."—President Hayes recently made a speech in Baltimore in which he complimented "honest journalism." If the management of all newspapers were "honest," the country would be far better off than it is at present, for then newspaper would condemn all dishonesty; but, unfortunately, too many newspapers are now used to help plunder the people. They advocate the election of dishonest candidates to office for the purpose of making money for their masters through corrupt practices.—*Morning Call.*

## USEFUL INFORMATION.

**IMPROVEMENTS IN DYEING.**—Mr. Theodore Daux is the inventor of a process for fixing rapidly and uniformly mordants on cachemeres, merinos and such kinds of woolen goods, as also for the chemical curing of wool. The goods are treated in this ordinary way until they are ready for the mordants. These are prepared cold, and are composed according to the color required, acidulated or not, or even consisting of one acid only, according to the new chemicals to be employed. The goods are immersed and worked till well impregnated, when they are lifted out and pressed, and afterwards passed on cylinders heated by steam to a high degree, in order to fix the mordant in a rapid and uniform manner. The fabrics thus mordanted are taken at once into the dye-bath at the boil, and the rest of the dyeing and finishing done in the usual way. Heated stoves can be used instead of cylinders. Mr. Daulol Faquet fixes colors by steam. He replaces the dye-baths which, as is not the rule, are generally heated up to a certain temperature in order to fix the color on the fiber, by completely cold baths, and afterwards steams to fix the color. It is said that great economy is effected by this method.

**FOR CLEANING KID GLOVES.**—Get one quart of deodorized benzine, one drachm of sulphuric ether, one drachm of chloroform, two drachms of alcohol. Pour a little of this into a clean bowl, and wash the gloves in it as you would wash anything. After the dirt is nearly out, rinse in more of the clean fluid. Usually one rinsing is enough, but if the gloves were very much soiled, rinse the second time. If the gloves are of cheap kid, it is best to dry them on the hand, but a nice glove, after having been rubbed with a soft cloth to smooth out wrinkles, may be hung on a line to dry. This preparation is an excellent thing to keep in the house, not only for cleaning gloves, but for taking out grease spots from clothing and carpets, and for sponging coat collars and felt hats.

A GOOD CROCK OIL is made as follows: Take olive oil and dissolve it in boiling alcohol, and add it drop by drop until it is no longer taken into solution. Upon cooling it will let fall crystals, and leave a considerable portion still fluid. The fluid part is to be poured off, filtered through a piece of white blotting-paper, and may be used in this form, or the alcohol may be distilled off for fresh processes, and the pure lubricating oil which remains is very suitable for oiling watches, clocks, or other delicate machinery. This will not oxidize or gum up, even when exposed to great cold. Or take neatfoot oil and drop into it some lead shavings in order to neutralize the acid contained in the oil. Let this stand for a considerable time (the longer the better). Oil thus prepared never corrodes or thickens.

**PURIFYING A WELL.**—A correspondent of the *Inter-Ocean*, living in Battle Creek, Mich., says that he purified his well of water, which was so subject to many worms, bugs and other insects as to render it almost unfit for drinking, by placing in the well a couple of good-sized trout. They have kept perfectly healthy, and have eaten up every live thing in the water; in the winter season crumbs of bread or cracker are thrown in. The water is perfectly pure and sweet.

**TO MEND BROKEN CROCKERY,** use lime and the white of an egg. Mix only enough to mend one article at a time, as it soon hardens and cannot be used. Powder a small quantity of the lime, and mix to a paste with the egg. Apply quickly to the edges, and place firmly together. It will soon become set and strong, seldom breaking in the same place.

**PRESERVING LEATHER.**—To preserve leather hose, belting, etc., in good condition, use crude castor-oil, warmed, if possible, and freely applied. It increases the pliability of the leather and the cling of the belts, and does not become rancid. Rats avoid it. In hose it should be pumped in from the interior under considerable pressure, thus thoroughly filling the pores.

**KEROSENE** will soften boots or shoes which have been hardened by water, and render them as pliable as when new. It will also make tin kettles as bright as when new. Saturate a woolen rag and rub with it. Stains may also be removed from clean varnished furniture with kerosene.

**SOREL'S CEMENT.**—Mix commercial zinc white with one-half its bulk of fine sand, adding a solution of chloride of zinc of 1.26 specific gravity, and rub the whole thoroughly together in a mortar. The mixture must be applied at once, as it hardens very quickly.

**BEESEWAX AND SALT** will make flat-irons as clean and as smooth as glass. Tie a lump of wax in a rag, and keep it for that purpose; when the irons are hot rub them with the wax rag, then scour with a clean paper or cloth sprinkled with salt.

**ASBESTOS POWDER,** made into a thick paste with liquid silicate of soda, is used with great advantage for making joints, fitting taps and connecting pipes, filling cracks, etc. It hardens very quickly, endures any heat, and is steam tight.

**GLUCOSE SUGAR FROM RAGS.**—We last week alluded to the manufacture in Brooklyn, N. Y., of glucose from old leather shoes. We now add the following: "The manufacture of glucose from rags, the novel industry recently started in Germany, is regarded with much disfavor, and it is understood that the German government will be likely to interfere with the business. The glucose is said to be chemically identical with grape sugar. The process, which is represented to be very cheap, is as follows: Old linen rags, which are composed of hard vegetable fibers, are converted into dextrine by the application of sulphuric acid; and the product thus obtained is then washed with milk of lime. Next it is treated with a stronger solution of the sulphuric acid than that first used, when the material is immediately transformed and crystallized into a glucose, from which appetizing jellies and tempting confections can be made."

**A NOVEL MODE OF CROSSING STREAMS.**—The following is an extract from a survey report by Lieut. (now Major) Woodthorpe, R. E., written in 1876, describing the method which he saw practiced by men of the Naga tribes, for crossing a deep stream too rapid for their feeble powers of swimming, and about 20 yards wide: "Taking large stones in their hands, they waded in up to their necks, and throwing up their legs and lowering their hands, the stones carried them to the bottom, along which they crept on all fours till they reached the shallows on the other side." The rough bottom afforded them sufficient hold to withstand the modified current and resist flotation.

**MICA IN SHOE MAKING.**—This mineral, mica, is now applied to a new use, that of fashioning it into middle soles to boots and shoes. The invention consists of a sheet of mica, embedded in thin coatings of cement, and placed in the boot or shoe, under and adjacent to the insole, the upper leather of the shoe lapping over its edges, or next under the filling and the outer, or bottom sole, and covering the upper space from the toe to the instep.

**WITHERED LEAVES** having the yellow-brown or red autumnal colors can be made green again by steeping them in water with a little zinc powder.

## GOOD HEALTH.

## Cigarette Smoking—Its Increase and Danger.

The Americans may be said to have become a nation of cigarette smokers. Time was, not a very great number of years ago, when the consumption of "paper cigars" in the United States was confined almost entirely to the foreign-born portion of our population. To-day more natives than foreigners smoke them. The enormous growth of the industry is readily shown by a comparison of figures. For example, in the fiscal year 1870, tax was paid in the United States on 13,881,417 cigarettes, and in the fiscal year 1880 on 408,708,365—an increase in 10 years of 394,826,948 cigarettes. The following table shows the number on which tax was paid during each of the past 11 fiscal years:

Year.	No. Cigarettes
1870.....	13,881,417
1871.....	18,030,753
1872.....	20,691,059
1873.....	27,088,056
1874.....	28,718,200
1875.....	41,297,883
1876.....	77,420,586
1877.....	149,069,257
1878.....	165,139,594
1879.....	238,276,317
1880.....	408,708,365
Total.....	1,180,271,072

The United States now ranks as the heaviest cigarette producer in the world, France coming next. The annual sale of cigarettes in France is estimated at 900,000 lbs., or about 300,000,000 cigarettes—only about one-quarter of the number consumed in this country. There can be but little doubt that the majority of cigarettes are consumed by boys between the ages of 12 and 18 to 20. Men, as a rule, smoke cigars and pipes. That the inordinate use of tobacco at an early age is hurtful is uncontested. Recent scientific investigations go to prove that smoking, especially cigarette smoking, is very detrimental to youths during the transition period from boyhood to manhood. The stunted forms of many men is as much due to excessive use of tobacco at an early age as to anything else. What cigarette smoking and absinthe drinking combined can accomplish may readily be seen by a visit to any large French town.

**VENTILATE YOUR CLOSETS.**—Soiled undergarments or the wash clothes ought not to be put into a closet, ventilated or not ventilated. They should be placed in a large bag made for the purpose, or a roomy basket, and then put in a well-aired room at some distance from the family. Having thus excluded one of the fertile sources of bad odors in closets, the next point is to see that the closets are properly ventilated. It matters not how clean the clothing in the closets may be; if there is no ventilation that clothing will not be what it should be. Any garments after being absorbed for a while will absorb more or less of the exhalations which arise from the body, and thus contain an amount of foreign—it may be hurtful—matter which free circulation of pure air can soon remove.

**THE SCIENCE OF LIFE.**—How few of us acquire this science until we are old enough for life to have lost half its charms! The sciences of life consists in knowing how to take care of your health, how to make use of people, how to make the most of yourself and how to push your way in the world. These are the things which everybody ought to know and which very few people do know. How never to get sick, how to develop your health and strength to the utmost, how to make every man you meet your friend, how to attach a few people to you as your bosom friends to be relied on in every case, how to earn money and save it, how to behave just as you ought to behave amid all the contingencies and unforeseen happenings of life, how so to live down your past if it is of such a character as to demand being lived down, how to manage yourself as to escape the entanglements of bad women and insincere friends, how to provide yourself, if you wish to do so, with a wife that will not be a burden and shame to you all the rest of your life, how to approach old age gracefully, so that you will not be a grief and reproach to yourself or others, how to make use of past errors and crimes, so that they may prove a help rather than a hindrance to you in the future; all these and many other things are to be included in the science of living, and the pity is that we only appreciate that science at its true value when the bloom of life is gone.

**THE EFFECTS OF WORRY.**—That the effects of worry are more to be dreaded than those of simple hard work is evident from noting the classes of persons who suffer most from the effects of mental overstrain. The case-book of the physician shows that it is the speculator, the hating man, the railway manager, the great merchant, the superintendent of large manufacturing or commercial works, who most frequently exhibits the symptoms of cerebral exhaustion. Mental cares accompanied with suppressed emotion, occupations liable to great vicissitudes of fortune, and those which involve the hearing on the mind of a multiplicity of intricate details, eventually break down the lives of the strongest. In estimating what may be called the staying powers of different minds under hard work, it is always necessary to take early training into account. A young man cast suddenly into a position involving great care and responsibility, will break down in circumstances in which, had he been gradually habituated to the position, he would have performed its duties without difficulty. It is probably for this reason that the professional classes generally suffer less from the effects of overstrain than others. They have a long course of preliminary training, and their work comes on them by degrees; therefore, when it does come in excessive quantity, it finds them prepared for it. Those, on the other hand, who suddenly vaunt into a position requiring severe mental toil, generally die before their time.

**HOW TO PREVENT WRINKLES.**—There is no such thing as wiping out wrinkles. In men they are often honorable evidence of hard mental labor, in women they are usually the evidence of coming age, although care and suffering have much to do with them. Sometimes fair foreheads are prematurely wrinkled from a nervous habit of raising the eyebrows, and from a too great and a too constant pressure of the pillow on one or both sides of the head while sleeping. And just here comes a fact worth remembering. If the forehead has escaped wrinkles, crow's feet are prematurely seen about the corners of the eyes. We all see these crow's feet in men and women whose brows are smooth and young looking. They are the result of sleeping on the light and left sides. The pressure upon the temple and cheeks leaves wrinkles at the corners and underneath the eyes which disappear in a few hours, but finally becomes so fixed that neither hours nor ablutions will abate them. If girl children were compelled to sleep on their backs and continued the habit when they reach womanhood and afterward, they would arrive at middle life without crow's feet gathering in the neighborhood of the eyes, and in most cases their foreheads would be free from even shallow furrows.

**A NEW FLEA PEST.**—The Manchester (N. H.) *Mirror* gives the following: A Hollis family by the name of Patch is tormented with fleas to a degree heretofore unknown in a civilized country. It appears that in 1876 a member of the family came from a sea-port town in a second-hand suit of clothing. Shortly after, the father, mother and three members of the household discovered the presence of a black insect. This insect is called a flea by the Hollis people. He burrows under the skin of the victim and tortures him day and night. Artificial heat makes him more lively, and hence the family have little or no fire in house, preferring to endure the cold rather than a terrible burning and itching. They have haked their clothes and hurned their beds, they have consulted medical men at home and abroad, have tried internal and external remedies, and still get no relief. They are isolated from the community and in deep trouble.

**STAMMERING** is sometimes organic, caused by hare-lip, cleft palate, lengthened uvula, tumors, or something of the kind. Of course, when this is the case, the cause must be removed. Sometimes it is caused by general weakness, paralysis, rheumatic affection of the muscles of the face, etc., and sometimes it is acquired by habitually imitating a stammerer. Any specific or cure for stammering must be adapted to the special cause which produces the affliction.

## The Week.

Since our last issue the Legislature has completed its session and adjourned, leaving a great deal of business unsettled, owing to the long wrangle over the debris act.

The explosion of the powder works, which is referred to elsewhere, has attracted considerable attention among mining men, owing to the nature of the materials used to manufacture the explosive.

We describe in another column a very complete leaching apparatus and mill built in this city for Mexico, and while this is not the first California machinery shipped there, we expect hereafter considerable more will follow.

The wages question is still being agitated on the Comstock. At Silver Reef, Utah, the question has bred trouble. When the men refused to work for less than \$4, the Stormont shut down and the Barbee & Walker only ran its mill on ore already out. On the 27th ult., a meeting of the Miners' Union was called, and afterward the men, forming into line, marched down to the Buckeye mine and requested Supt. Allen, of the Stormont company, to leave the camp forthwith. Mr. Allen requested three hours' time, in order to arrange his business matters, but the men were peremptory, and told him that five minutes was the limit. Mr. Allen thereupon mounted his horse and left the camp, being accompanied as far as Bellevue by an escort of Miners' Union men. This action will leave the organization open to severe criticism. The Christy and Barbee & Walker mines will probably be shut down also, and the miners will do themselves no good by acting toward the Superintendent in this manner, since it is the companies, not the Superintendents, who take the action.

## California Mining Machinery for Mexico.

The New Mill, Furnace and Lixiviating Works for the Rosario Mining Co.

Prescott, Scott & Co. have just finished to order of Parke & Lacy, the most complete mill, with roasting furnaces and lixiviating works ever constructed on this coast. The plant is intended for the Rosario mines, Mexico. Two schooner loads of the material have already been shipped, but the engine and some other machinery is yet to be sent. The whole mill and reduction works, when ready to run, will have cost \$150,000. Every portion of the machinery combines all the latest improvements of every kind, no expense or pains having been spared in carrying out the plans.

The mines being about 100 miles from the sea coast, this machinery will have to be hauled over the road, which has been put in order for the purpose. The contractors here had made to order and shipped by the steamer *Neuborn*, ten 16-mule wagons, with harness and all necessary appliances for handling the machinery. The engine frame weighing 11,000 lbs., a special wagon was made for it, and special wagons with saddles were made to take the two steel boilers, which weigh 7,500 lbs. each. They ship from here to Guaymas, a port of entry, and there, without unloading, having no dutiable material aboard, the schooners sail down the coast, 150 miles to Ajavampo, where the freight is landed.

For the present, only 40 stamps will be used, but the mill is so arranged that it will eventually be made of 80-stamp capacity, the engine being of sufficient power and all the arrangements being made to that end.

The ore is delivered to the ore-house by a tramroad or wire tramway two miles long, running from the mine to the mill. The drying of the ore will be done in the Stetefeldt dry kiln, a device for which Mr. Stetefeldt lately obtained a patent through the MINING AND SCIENTIFIC PRESS Patent Agency. This drier consists of a series of inclined cast iron shelves, upon which the ore rests and slides down when the dry ore is removed from the lowest shelf. The fire enters the kiln or drying chamber under the top shelf, and works downward, an important feature in the saving of the iron. When the fire is applied first to the lowest plate, upon which is already heated ore, this plate becomes red hot and requires frequent renewal. When applied first to the upper plate, receiving fresh cold ore, this is not the case. As soon as the ore is dried it falls into care and is taken to the Eclipse feeders at the batteries. The batteries have double discharge mortars of an improved pattern, which are found, upon test, to be very effective in a dry-crushing mill. In order to take away all the dust, two large dust chambers are arranged above the batteries, provided with sheet-iron hoppers. These dust chambers are connected with a Sturtevant exhaust fan which draws the dust into them, where it is deposited at the bottom of the sheet-iron hopper, from whence it is discharged when it accumulates in sufficient quantity.

From the battery the pulp is taken by screw conveyors and an elevator, first, into a hopper provided with a sifter or revolving screen, where coarse particles are sifted out and returned to the battery. The hopper is provided with a Standish feeder by which the pulp is discharged into the conveyor and elevator, which takes it to the Stetefeldt furnace. This furnace is of the largest size, with a shaft 6 ft. square and 43 ft. high, and a system of 12 dust chambers. Mr. W. D. C. Morgan, one of the owners of the mine, came to this city last season and investigated the different furnaces in use and the modes of working ore. After due consideration he chose the Stetefeldt, and Mr. Stetefeldt himself was employed to draw up the plans.

The building which is to cover the furnace, dust chambers and cooling floor, will be 46 ft. wide and 102 ft. long. The furnace will be built in the most substantial style, with a great many improvements in construction, which are the result of the experience at the Ontario mill, Utah. It is calculated to roast from 40 to 50 tons of ore, which is about what the mill will work, the ore being very hard.

The ore, after cooling, is taken to the leaching-house in cars. The leaching-house will be 104x38 ft. There are eight leaching-tanks of 12 ft. in diameter, and the necessary tanks for precipitating and for the solutions. For the conveyance of the solutions back to the upper tank again for re-use, a novel method is employed, the usual pumping system being dispensed with. Below all the leaching-tanks and vats is a tank connected with an air compressor, the pressure of air driving the liquid to the upper vat or reservoir. For the drying of the silver precipitate a centrifugal machine will be used.

The roasted precipitate will be melted in a reverberatory furnace with charcoal gas fire, this furnace being constructed with a peculiar removable hearth, so that the hearth can be readily repaired if it becomes injured by the matte which results from the melting of the bullion.

The plans for the furnace, drying kilns, leaching tanks, etc., were all made by Mr. C. A. Stetefeldt, and the position of the batteries and engines had to conform to these more or less. The engine combines all the latest improvements, and is acknowledged to be the most complete machine which has come out of this shop, which is noted for its first-class work. In beauty of finish and neatness

and compactness in design, it is of a type which cannot be surpassed.

The improvements are more particularly in the details of construction. The engine is a 24x60 inch, with a box frame instead of the usual Allen frame. The advantage of this is that it is unusually strong, and at the same time economical. The frame, being cored out, gives as great strength as used to be gained with double the material. It weighs above 11,000 lbs. The pillow block is light in construction, but strong and durable. Its peculiar form gives it an advantage in adjustment of the quarter brasses; that is, in taking up the wearing surface of the brasses on each side of the pillow block.

The cross-head is adjusted by a nut setting it out to the surface of the slides in the frame. This admits of a free adjustment, and of getting it in perfect line.

The eccentric rods, valve rods and cut-off rods all have first-class bronze for journals, thus giving a better bearing surface, with no liability to heat.

The fly-wheel is 18 ft. in diameter, and weighs 30,000 lbs. The main pulley is 16 ft. in diameter, 43-inch face, and is made in 8 separate pieces bolted together. It works on a 13-inch shaft. The valves are made of bronze, and all the working parts of the cut-off are steel and every nut used in construction is case-hardened. The engine is fitted with Phillips' improved metallic packing.

The valve motion and cut-off is that invented by Eugene O'Neill, chief draftsman at the Union, and who recently patented the improvements through the MINING AND SCIENTIFIC PRESS Agency.

A ball governor is used, having a sleeve at the lower part of the spindle, which moves up and down upon the spindle by the expansion or approach of the governor ball. The governor is so arranged that an upper cup on this spindle can be partly filled with shot according to the speed at which the engine is to run. By this means the exact speed can be regulated without any change of belt. The steam valves are placed vertically above the exhaust valves, the seats being just far enough above the exhaust valves to leave clearance for the latter to work. The steam valve has a central hollow sleeve, and the stem of the exhaust valve passes up this sleeve and a stuffing box on the valve chamber cover, and is secured to a sliding bar or frame moving in suitable guides and raised by a cam oscillated by a crank arm and a pitman, and eccentric from the engine shaft. The late improvement by Mr. O'Neill more particularly refers to the intermediate mechanism which is connected with the governor, and which regulates the movements of the rocker arm and the trip mechanism of the valves.

A pair of bell cranks, pivoting on a horizontally reciprocating slide, have their ends connected to the cut-off rocker arms, and the other ends are connected to the sleeve on the governor spindle. The throw of the governor and its consequent action upon the valves is regulated by the variable weight, consisting of the receptacle or cup for the shot which surrounds the spindle, and is supported by the governor arms. Mr. O'Neill has done away with the inclines on his cut-off, and substituted bell crank motion, which works much better, as the point connecting the bell crank is always at the same level, and sometimes it used to be at a bad angle.

The stamps have dies and shoes 8½ inches in diameter, the heads being 8½ by 18 inches long. There are four cam-shafts 14 ft. 6 inches long, and 5½ inches in diameter. For these there are four wooden pulleys 6 ft. in diameter and 17½ inches face.

There are also two 9x13 Eclipse ore-crushers, and eight swivel dump cars. The No. 5 Knowles' pump is a very handsome nickel-plated finish, with a steam cylinder 7 inches in diameter, water cylinder 4½ and 10-inch stroke.

There is one pair of 54-inch diameter steel boilers 16 ft. long with 46 tubes 3½-inch. The double steam drums are 40 inches in diameter and 12½ ft. long. The mud drum is 30 inches in diameter and 14 ft. long. The stack will be 42 inches in diameter and 80 ft. long. The Crosby steam gauge, water gauge, revolution register, locomotive clock, and the Edison time recording and alarm gauge will all be set up in a handsome case in front of the engine. These Edison gauges keep a perfect record of the performance of the engine, and give an alarm in case the pressure rises above a specified figure. A set of fire tools, tube scrapers, 240 extra shoes and dies and a lot of miscellaneous articles not procurable in Mexico, go with the plant.

Among other improvements forming part of this machinery, is the heater, which was devised by the Union Iron Works recently. It is 30 inches in diameter, 9 ft. 8 inches high, and has 157 square ft. of heating surface.

This heater consists of a series of tubes secured vertically in a base by being screwed into place. Over each of these fits a larger tube which screws into the upper plate of the base. The tubes are only secured at their lower ends, thus leaving plenty of opportunity for expansion without injury. The feedwater is forced up the inner tubes to their tops, there overflowing and coming down the space between the two tubes, the outer ones of which are enveloped in the exhaust steam in the heater. This compels a circulation of the water and produces a temperature of 208 degrees, before the water enters the boilers.

The mines of the Rosario mining company are located in the Rosario mountain, a spur of the Sierra Madre, a distance of 100 miles from the port of Ajavampo, on the gulf of California,

to which there is a good road; about 90 miles from the city of Alamos where there is a mint, and about 30 miles from this city of El Fuerte. They are surrounded by an estate of 100,000 acres of land belonging to the company. At the base of the mountain about two miles from the mines, a number of streams unite and form an abundant supply of water. Here the mill will be erected and the reduction works established, the ore from the mines being brought on the wire rope tramway before referred to.

The Rosario mines were discovered by Don Bruno Esquer in 1852. They consist of a group of nine mines, under the following names. Dulces Nombres, San Jose, Bueno Fe, Carmen, San Genovera, Providencia, San Rafael, Sonorensis and Descubridora. They are on one vein and together embrace a distance of 9,600 ft. The vein is 4,000 ft. above sea level, and the adjoining valley 2,000 ft.

The work done on the various mines by the Mexican owners has all been of a rude and primitive character. The vein has been attacked only where an unusually rich place presented itself in the outcrop, and worked only so far as the great richness of the ore paid the owners well for the reduction by the rude processes employed for the purpose. Yet the records of the mines show a yield of over a million dollars. The vein is very wide, a cut of 42 ft. in one place failing to show the walls. Developments have chiefly been limited to the Dulces Nombres and Descubridora, on the east side of the mountain, and the San Rafael on the west side.

There is already at the mine a No. 4 Burleigh air compressor to run seven stopping drills, a saw mill to cut timber from the lumber on the property, a brick machine for making brick for the furnaces and houses, and also a mill for grinding sugar cane upon the ranch.

The Descanso ranch, belonging to the company, and on which the mines are situated, comprises 100,000 acres of land well watered and wooded, and perfectly adapted for agriculture, producing among other things Cuban sugar cane, maize, potatoes, wheat, bananas, plantains, oranges, etc.

Within a short distance of the Rosario and in the same range are many other well-known and profitable mines; among others the Trinidad, Jesus Maria and Quintana, in the State of Sonora, the Uriqui Batopilas, Morelas, Jocuistita and Guadalupe y Calvo, in Chihuahua, and the Palmarajo, in Sinaloa. The Rosario company is a New York organization, General Geo. B. McClellan being President, the other Trustees being A. Hegewisch, Hon. Hugh J. Jewett, Wm. H. Hays, Herman R. Baltzer, Hon. David A. Wells, Herman Drieler and W. E. Kimball. The general manager, a gentleman of wide experience and acknowledged ability, who is now at the mines, is Donald McNeil Palmer, Esq. The prime mover in the organization was W. W. McFarland, Esq., of New York, to whom is due the credit of having undertaken the project.

## The Suro Tunnel.

It seems to be a pretty well settled opinion upon the Comstock that the Suro tunnel has come under the control of the bonanza people, but as yet there is no official announcement of the fact. It is probable that if the bonanza people are going to boost the low-grade ores, the tunnel will be of great use to them, as they can save a dollar a ton by owning it. The *News* in speaking of the subject says that "the mines of the Comstock need the adit of the tunnel, and the draining facilities; and in the hands of no one will it be made more conducive to the workings of the lode than in those of the men controlling many of the principal mines of the lode, and those more particularly benefited by its operation. If the tunnel is in the hands of that firm, we may look for a more extended use of it. Money is needed to make the tunnel of the greatest utility to the mines, as well as to construct new works, and carry on operations through it. If the tunnel is in bonanza hands, the fact will soon be manifest."

It is very probable that the tunnel, by reducing the cost of handling and working the ore, will play an important part in the question of utilization of the low-grade ores. As to the tunnel itself, Supt. Thomas informs a Virginia *Chronicle* reporter that it is in fair condition from end to end, and there is no danger of its caving, as all the bad places have been carefully repaired and closely timbered. No preparations have as yet been made for receiving the water from the Yellow Jacket, Imperial and Belcher mines, but there is plenty of time to provide for this before the connection is made with the Yellow Jacket. A line of drain boxes will probably be laid in the south lateral drift of the tunnel, the same as is now laid in the north lateral. Indeed, this is the only way that the water can be taken off, as the drain in the bottom of the tunnel has not yet been finished up to the point where the fourth lateral makes off. It is by no means certain that the drain box in the main tunnel will be able to carry all the water that will be given it after the Jacket connection is made. If it is not, another drain box can be readily put in.

The new workings in Belcher are not entirely to search for low-grade ores. They are prospecting to open new ground south and west of the shaft on the 520 level, where lies a portion of the back ledge never yet explored. There are reasonable hopes of success in the venture.

## Extraction of Gold by Chlorination.

Among late improvements in chlorination processes for working gold ores is one invented by a citizen of Saco, Maine, which consists in exhausting or removing the air from the treating vessel, and supplying chlorine to replace the air and fill the vacuum created.

It is well known that chlorins will dissolve gold and other metals, and form valuable chlorides, which can then be leached out, leaving substances not attached by chlorine, and also such chlorides as are not soluble. This chlorine process is in common use, especially in making exact assays of gold ores and mixtures. It has also been applied as a working metallurgical method, but has been attended by many practical difficulties. Of late years it has been applied in the shape of the so-called "chloride of lime," (bleaching powder) which, when mixed with ore, upon the addition of sulphuric acid, liberates chlorine which dissolves the gold; or lime has been mixed with the ore, and chlorine gas passed into the mixture under pressure, so as to dissolve the gold; or a solution of chlorine in water has been digested with the ore, so as to dissolve and leach out the gold as a chloride. The process referred to differs from all these, and it consists, first, in exhausting the air from the vessel containing the ore prior to admitting this chlorine in the form of gas; second, in preparing the gas, and storing it in a gasometer, or holder, so that it may be supplied as wanted to the vessel containing the ores; third, in a device for manipulating the ores in suitable vessels, so that the necessary connections may not be easily disarranged, so that the gas is not allowed to escape to interfere with the workmen, so that there may be no useless waste of materials, and so that a complete control of the operation be secured. The accompanying drawings show suitable apparatus for carrying on the process.

B shows a chlorine generator of ordinary construction, whereby a mixture of common salt and black oxide of manganese and the addition of sulphuric acid, chlorins gas may be produced. Any other compound capable of producing chlorine in sufficient quantity may be substituted.

The chlorine gas passes by a pipe into a vessel, C, where it is washed in the ordinary way, and passes thence into the gas-holder, D, by a pipe. This holder is nicely balanced, so that it will rise and fall without pressure, or very slight pressure, on the holder and its connections.

The vessel, E, is for holding the ore while being treated, and may be called the "chlorinator." It is made very strong, so as to resist collapsing when exhausted of air. It may be from three to six ft. in length, in the form of a cylinder—say about three ft. in diameter.

F shows an exhausting air-pump, of ordinary construction, connected with this chlorinator by pipe and coupling. The chlorinator, E, is placed on rails or tramway, as shown, so as to be rolled from side to side, so that when the treatment is finished it may be rolled away to be emptied and replaced by other vessels. The chlorinator, E, may, if desired, serve as a leaching-tank.

The pit, G, serves for the workmen that handle the chlorinator.

H is a vacuum barometer or gauge to show the degree of exhaustion in the vessel, E.

The following is the way of using chlorine described by the inventor: Have a gas-holder, like any other holder for burning gas. Fill in any way as the gas is generated. When it is supplied and the holder is up, or partly so, let it balance on the weights, so that if the gas is sucked out the holder would descend by reason of the effective of external pressure due to the vacuum rather than by its own weight. This holder could stand ready for use. It may be made of lead, varnished with paraffine or other varnish not acted on by chlorine. A tube is run from the holder to an apparatus, like an old soda fountain, lined with lead, or may be made of stone or stoneware. In this vessel, which is called a "chlorinator" or "vacuum-chlorinator," the well-roasted ore, dry or damp, is put, and the air exhausted, so as to produce as perfect a vacuum as possible by an air-pump, or by other means. By means of the pipe leading from the gas-holder, the gas (chlorine) is allowed to enter slowly or rapidly, as occasion may require, into the chlorinator and mingle with the ore or metal to be operated on by the pure chlorine.

The gas penetrates among the particles, fills the spaces or interstices, and acts on the particles as well as on the surface of the pile of ore. The chlorinator is now tumbled or rolled so that the ore in it may be tumbled over itself or agitated while the chlorine is combining with the gold or other metals.

As the chlorine enters into combination additional quantities are drawn into the chlorinator and exhausted from the holder. Since the gas combines with the metal of the ore, and is thereby condensed, the effect is produced by exhausting, not by pressure. By this means (exhausting) the chlorinator is free of all air, vapor and gases, the surfaces of the particles of ore brought into perfect contact, and a more perfect action insured, as there are no other elements to conflict with the action of the chlorine. Chlorine being heavier than air and some other gases, it tends to remain on the ore at the bottom of the apparatus and not to escape. Now when all action has stopped—that is of the chlorine on the metal—a stream of

water may be let into the chlorinator at this level of this ore, or beneath it, and thus raise the remaining chlorine out of the ore into the spaces above, and by filling the chlorinator with water the remaining gas can be driven back into the holder, raising it up in proportion to this quantity forced back; or the chlorine can be blown away by air simply by attaching a tube to a blacksmith's bellows or any other blower and blow air through the chlorinator and deliver the air and chlorins wherever desired. When chlorination is complete the ore is to be taken out, either wet or dry, and leached with water to take out the metallic chlorides.

It will be seen that this invention obviates the use of strong, tight pressure-cocks and jacks, that must be used where pressure is exerted.

In this process the whole operation is on the principle of vacuum rather than on pressure. Using an air pump to exhaust the air and gas from the ore is claimed to ensure a clean, perfect contact for the chlorine.

There need be but little waste of gas. That which is not absorbed by the ore can be blown or forced back to the holder by the same pipe it came in by, and to act on the other one in another chlorinator. This would get rid of strong coupling, since all joints and pipes might be made of india-rubber and slipped into the tubes without nuts and screws, no pressures being used.

The inventor says that pressure and impurities are what he wants to get rid of. The use of chlorine under pressure is troublesome to the operator and corrosive to the apparatus employed. By generating the gas in separate vessels, keeping it pure and apart from the ores, and using it pure, the gold chloride, when filtered, will be free from lime sulphate, as is not now the case when the chloride of lime and sulphuric acid are used with the ore in this chlorinator under pressure.

## New Mining Regions.

It looks now as if in addition to the rapidly increasing tide of travel to Arizona and New Mexico, there will be an excitement northward,

BOYNTON'S APPARATUS FOR CHLORINATION OF ORES.

and Alaska and Idaho will also increase their population by several hundred miners. The Wood River country in Idaho is attracting great attention, and already many miners are preparing to go there as soon as the weather will permit. The winter has been a rough one there. The snow fall at Bellevue has been so far almost 75 inches on a level. At Ketchum there was 150 inches. Most glowing accounts of the richness of these mines have appeared from time to time, and during the winter many strikes have been made which appear to sustain the opinion that the camp will be a permanent and rich one. The Smoky district, which is in the Wood River country, is also attracting attention. In the Saw Tooth district in the same region, most encouraging results have attended the operations.

The recent reports from Alaska have attracted toward that Territory a great deal of attention. We have heard of the organization of several prospecting parties who are going in that direction. We gave in a recent issue of the PRESS quite an extended account of the late discoveries in Alaska, written for us by Mr. Pilz—who, by the way, the compositor named Mr. Bilz. This is the most extended account we have seen. It must be remembered, however, that there was previously an excitement, and men were sent up last year to work the Henrietta ledge five miles from Sitka, but on arriving, found there was "no money in it." They returned to San Francisco by the next steamer. But just after this a party employed by Mr. Geo. E. Pilz returned, and brought the rich free gold quartz which he described in his letter. This renewed the excitement. The mines are on the mainland to the eastward of Douglass island, Stephen's passage. A number more men were sent out, and they found at an elevation of about 1,500 ft., embedded between secondary granite and basaltic rock, six true lodes of auriferous quartz carrying galena and black sulphide of silver. A river cuts completely through the lodes, and prospecting in its bed yielded from 50 to 80 cents a pan, promising rich placer mines. The lowest assay of the quartz was \$150 in gold a ton, and several reached as high as \$3,500 a ton.

We shall keep our readers posted as to any developments in any of the localities where so much interest is now turned,

## Completion of the New Trans-continental Route.

An event of more than usual interest was consummated in rather a quiet way on Tuesday, the 8th inst., namely, the union of the rails of the Southern Pacific railroad with the Atchison, Topeka & Santa Fe railroad. The approaching completion of a second trans-continental railroad through a section of country rich in mineral resources, and on a parallel of latitudes that exempts the new road from the heavy snow storms which so often embarrass the operations of the more northern and hitherto only rail route across the country, had been watched with much interest by the people of this State, who are now to be congratulated upon their increased railroad facilities. The southern portion of California has for months been reaping substantial benefits from its railway connections with Arizona, and its present prosperity will be greatly enhanced by the extension of such connection to the East. Arizona and New Mexico are now fair and rich fields for California merchants, manufacturers and producers to cultivate, the careful tilling of which will greatly enrich our State, as well as proving profitable to the individuals who reach out for the newly opened markets.

The following dispatch from Deming Junction, New Mexico, gives a brief account of the driving of the last spike: The Atchison, Topeka & Santa Fe made connection to-day at this point at 3:45, San Francisco time. There were present R. R. Colman, Manager of Construction of the A. T. & S. F. R. R.; A. Longstreet, of the Southern Pacific; J. H. Bates and J. F. Kilalea, of the same, and others. The silver spike was driven at 3:45 by the above-named gentlemen. Engineer O'Neil, of engine 503, Atchison, Topeka & Santa Fe, ran the first engine from the Atchison to the Southern Pacific road. There was no further demonstration. Through mail and postal facilities have all been arranged. The first through train will leave San Francisco at 8:30 on the 19th, and make the trip through to Deming Junction in 60 hours. It was generally understood that

## The World's Fair of 1883.

The Executive Committee of the World's fair, to be held at New York in 1883, are holding frequent meetings at their rooms in that city, and report a gratifying increase in popular sentiment everywhere; not only in this country, but in Europe as well. Gen. Grant has added much strength to the enterprise, and has taken hold of it with energy and determination. Mayor Grace, of New York, who is Chairman of the Finance Committee, is fast doing away with the temporary differences which beset the enterprise at its outset, and is now meeting with decided success in his efforts to interest and organize the support expected from the business men of New York.

The Centennial exhibition, although a grand success, was an experiment, and did not elicit anything like the full interest of all the States of the Union. Some, indeed, did not participate at all; but those that made appropriations were amply reimbursed in the advantages which they derived. The only regrets over the grand results have been formed in the minds of people whose States failed to make appropriations to enable their citizens to share in the benefits.

This was especially the case with California, but the recent Legislature found time in the midst of a greatly disturbed and exciting session to unite in a strong majority for the passage of a bill appropriating \$5,000 "to provide for a proper representation of the products of California at the next World's exhibition, to be held in New York, in 1883." The amount is small, but it is amply sufficient for all preliminary work; and there can be no doubt but that the next Legislature will supplement this appropriation by whatever additional amount the wants and needs of exhibitors may seem to require.

The States and Territories will determine, each for itself, the manner and character of their exhibitions. Some will prefer to make full exhibitions; others to exhibit specialties. Some will prefer to furnish their own exhibition buildings, after the manner of Kansas and Colorado at Philadelphia. Others will seek space in the buildings of the Commission. It is yet too early to forecast what may be the policy of California, but at the proper time this matter will take shape, according to circumstances. Efforts will soon be made to arrive at an approximate estimate of what will be the extent of California's exhibits, and the space which she may need. It has been suggested that a street of States should be laid out in one of the principal buildings, similar to the street of Nations in the main building at the Philadelphia exposition. Such a design, if properly carried out, would form an imposing feature in the exposition, and would do much to excite an honest spirit of emulation among the exhibitors from the different States. An avenue of States has also been suggested, with buildings for State exhibitions, like the Kansas building at Philadelphia, where the great mass of the exhibits of the several States could be aggregated. For such a plan the great grain-producing States of the West might make their exhibits more prominent by introducing them in bulk; the Southern States would have ample room for their bulky products of cotton, rice and sugar; the mining States, their combined products of mine and field, and the New England States their manufactures, etc. Such an arrangement would be especially favorable for adding interest and zest to "State days," which will be set apart for the different States for special State ceremonies. This feature contributed largely to the interest of the exposition of 1876.

The times are propitious. The country, and indeed the whole world, is fast entering upon an era of remarkable prosperity. Our experimental exhibition of 1876 surprised both ourselves and Europe; and the announcement of another American International exhibition for 1883, is awakening interest abroad, far beyond that which was created in 1876. Our people, our merchants, our capitalists, our manufacturers and our producers of every class, should and will be fully aroused to the importance of the work in hand. The exhibition of 1883 will be commensurate with the growth of the country, and worthy of the exalted purpose to be accomplished in aid of the united industries of the world.

## Academy of Sciences.

The regular meeting of the Academy was held last Monday. Among the donations to the Museum were large shrimps from J. P. Moore. These are what were recently mistaken at San Rafael for young lobsters. From D. J. Staples, a four pound striped bass, 20 inches long by 7 inches deep, taken outside the Golden Gate, from C. S. Capp, a peculiar gold fish; from W. H. J. Brooks, a lizard, mole and white gophers.

Mrs. J. G. Lemmon read a very interesting paper on Pacific coast ferns, giving not only a popular but a scientific account of them.

Dr. Harkness read a paper on a new grape root fungus. We shall give this paper in full. The President read a paper on Alaska's system of Internal Water Communication, by Ivan Petroff. This we shall also give in a future number of the PRESS.

HEAVY snows in Scotland have blocked all traffic.

the Presidents of the two roads would be on the ground at the union to-day. The following congratulatory telegram was sent by Governor Fremont and the Arizona Legislative Assembly: Prescott, March 8th.—The congratulations of the eleventh Legislative Assembly of Arizona are tendered to the Atchison, Topeka & Santa Fe and the Southern Pacific Railroad Companies, upon the junction of their roads, an event which will mark a new era in the prosperity of our Territory, and which gives a second great transcontinental route for the trade and travel of the world. Signed, J. C. Fremont, Governor; Murat Masterson, President of the Council; J. F. Knapp, Speaker of House.

WOOD RIVER.—We take the following items from a letter to the Salt Lake Tribune: The winter is but half over and our communication with the outside world is open by way of Blackfoot. Mails are as regular as clockwork—six times per week to all points on the river. The snow fall at Bellevue this winter has been about 75 inches on the level. The Wood River mine owners of late are greatly pleased to learn of the new discovery in the Maud May, in Green Horn gulch. This property is owned by some New York men, who have kept two Utah miners at work this winter on the same. Ten or twelve days ago they came back very much elated over the fine appearance of the mine. They had, as they reported, followed down their shaft on the hanging wall for over 230 ft. without finding any regular body of mineral. One of the party made a suggestion to cross-cut the lead, which led to the discovery of a body of galena and carbonates over five ft. in thickness, assaying over 100 ounces in silver, and very rich in lead. The ore lay on the foot wall in a lime formation.

The tin mines of Cornwall are all looking well, and producing large quantities of tin ores, from which considerably increased dividends will be paid in the year 1881, for there is a strong feeling among those well able to form an opinion that the price of tin in the next 12 months will advance at least 25% to 30% per ton. There is at the present moment a great demand by capitalists for the investment of money in good Cornish tin mines, both of a dividend and progressive character.

### Subterranean Heat and Plant Life.

During a discussion the other evening, at the California Academy of Sciences, on the subject of the change of climate in Arctic regions, the question of subterranean heat and plant life came up. One of the members said he thought Greenland once had a warm climate, as British explorers found the *Sigilaria* and palm leaves impressed upon its fossil sandstones, and the qualities of coal and coal formations found there could only have existed in quite a warm climate. Some eminent French physicists think that all life started at the Poles, as these points received less of the heat developed by the sun. Tigers are considered as tropical animals, yet they are now plenty in eastern Siberia and Manchuria.

The presiding officer was opposed to the theory of cataclysms because he did not like to contemplate such things as possible. He argued that earth had formerly a higher temperature throughout its entire surface, and during its continually cooling process the present tropical plants have gradually moved toward the equator from the Poles, as the Poles become colder.

Dr. Kellogg thought that all theories which were based on the supposition that subterranean heat influenced plant life, were incorrect. In the course of a life-time study of plants, he had seen no evidences of subterranean heat assisting plant life. He thought the sun had the most to do with the existence of vegetation. He based his opinion on his experience, and gave the following example as a proof that subterranean heat has no decided influence. When last in Alaska he took occasion to visit a large active volcano, and during a trip of four days passed many others which were still also active. He traversed extensive fields of volcanic scoria, and gathered plants in every direction. He paid particular attention to the situation of the plants, as any hotanist would. In following up his work, he had occasion several times to dig under the surface soil, and at a depth of 10 inches, it was so hot he could not hear to touch it with his finger. Yet no indications of this were evident on the surface. The heat was not perceptible. He did not see here any more flourishing vegetation than elsewhere. There were plenty of plants, but they showed no more vigor than in other situations near by. It did not seem as if this subterranean heat, so close to their roots, influenced them at all.

L. K. DRAIS writes from Florence, Arizona, to friends in Winnemucca that the country is ten times more desolate than Nevada. There are some good mines discovered, and as there are a good many capitalists ready to buy mines, it ought to be a good place for prospectors; but labor is not in demand, and there are three men for every job. All the freighting business is carried on by companies who have their own shops and employ their own mechanics. Outside teaming is carried on by Mexicans, who use oxen for wheelers and mules or horses for leaders, and it is not unusual to see a team of six animals composed of horses, mules and oxen.

WM. BARTLING.

HENRY KIMBALL

BARTLING &amp; KIMBALL,

BOOKBINDERS,

Paper Rulers & Blank Book Manufacturers  
505 Clay Street, (southwest corner Sansome),  
SAN FRANCISCO.JOHN A. CHURCH, E. M. PH. D.  
MINING ENGINEER,

Room 75, 115 Broadway, New York.

Agent for PADDOCK'S Ore Dressing Machinery.

Mining Machinery supplied.

San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS &amp; CO.,

611 and 613 Front Street, San Francisco

### New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. PH. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

### USEFUL BOOKS

Relating to Casting and Founding, Electricity, Electric Light, Engineering, Drawing, Manufacture of Gas, Heat, Indicator Diagram, Link Motion, Mechanics, Screw Cutting, Slide Valve, Steam B-ilers, Steam Engines, Steel, Turning, Wire Gauge, Workshop Receipts. Descriptive Catalogue sent prompt on application.

E. &amp; F. N. Spon, 446 Broome St., N. Y.

## MOREY & SPERRY,

MANUFACTURERS OF

### Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C. No bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply. Iron Work complete for Wood Frames, also.

SPERRY'S  
WROUGHT IRON FRAME  
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores, Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

PACIFIC MACHINERY DEPOT.

## H. P. GREGORY & CO.,

Nos. 2 and 4 California Street, San Francisco.

Importers and Dealers in every description of

### MACHINERY!

Sole Agents for the Pacific Coast for

BUCKEYE  
Engine Company.

J. A. Fay & Co.'s Wood-Working Machinery; Benient & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Belting and Packing Co.'s Rubber Goods; Sturtevant Blowers and Exhaust Fan; Tanite Co.'s Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus Self-Oilers; Gould Mfg. Co.'s Hand and Power Pumps; Bellows Windmills; Diston & Sons Circular Saws; Otto Silent Gas Engine; Dues' Elevator Cups; Ballard's Oak Tanned Belting.

Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

### NOTICE!

ENGINEERS, DEALERS AND USERS OF STEAM PUMPS

Will please take notice that we have taken the sole agency for the KNOWLES' STEAM PUMP, for the Pacific Coast States and Territories, and keep a full stock of Pumps and Duplicate Parts on hand at all times.

PARKE &amp; LACY,

Nos. 21 and 23 FREMONT STREET.

San Francisco, Cal., September 23, 1880.

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-OLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

## Judson Powder

IS NOW USED IN ALL LAROE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN &amp; CO.,

SAN FRANCISCO, CAL.

### LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for New Prices, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL &amp; CO., Springfield, Ohio,

and 110 Liberty St., N. Y. City.

### Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867. This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, equipments and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

### L. P. DECEN.

MANUFACTURER OF

Also Water-Proof Leather Belting.

NO. 13 FREMONT ST., near Market, SAN FRANCISCO

### Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arsenurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequalled by any other published embracing the subjects treated. Post-paid, \$7.50. Printed and sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, \$2. Published and sold by Dewey & Co., S. F.

COPP'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, \$1.00. Sold by Dewey & Co., S. F.

A New Edition.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. 1880. A valuable and carefully written work. Post-paid, \$3.00. Sold by Dewey & Co., S. F.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates.

DESIGNERS AND BUILDERS OF  
**MILLS AND METALLURGICAL WORKS,**  
FOR THE TREATMENT OF  
Gold, Silver and Copper Ores.

Mines examined with a view of determining their value, and the method of treatment best adapted to their product. Will furnish estimates, plans and specifications, and superintend or contract for the erection of all kinds of Mining and Milling Machinery.  
Leadville, Colorado, P. O. Box 2039.  
New York Branch Office, 68 Broadway, P. O. Box 203.  
S. F. Agents, Prescott, Scott & Co., 61 First St., P. O. Box 2128.

### F. VON LEICHT,

**Mining and Civil Engineer,**

432 Montgomery Street, San Francisco.

Reports, Surveys and Plans of Mines made.

### OTOKAR HOFMANN,

(Of the Firm of Hofmann Bros.)

**Metallurgist and Mining Engineer.**

Erection of Leaching and Chlorination Works a specialty. Working Tests and Reports made.  
415 MISSION STREET, SAN FRANCISCO.

**METALLURGICAL WORKS,**  
STRONG & CO., 10 Stevenson Street, S. F.  
ORES SAMPLED, TESTED, ASSAYED.

### J. S. PHILLIPS, M. E., ETC.

May still be consulted by old friends. Address No. 1 Wall Street, New York.

### A Card from Architects.

**The California Architect and Building Review.**

Office, No. 240 Montgomery Street, San Francisco, Cal.  
It is with pleasure that we publish the following from prominent Architects in this city:  
Believing that a journal of this kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Parkins, Wright & Sanders, S. H. Williams, Thos. J. Webb, F. Huern, John Marquis, McDougall & Son, Wm. Mooser, Wm. Carlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson

## SELBY

## SMELTING and LEAD CO.

### REMOVAL.

## JUSTINIAN CAIRE,

IMPORTER AND DEALER IN

**Assayers Materials, Chemicals AND MILL SUPPLIES.**

Brass and Steel Wire Screens, Hardware and Fancy Goods, Opera, Field and Marine Glasses, Optical Instruments, Etc.

Nos. 521 and 523 MARKET STREET, S. F.

The attention of Assayers, Chemists, Mining and Milling Companies is particularly called to the complete stock of Balances, Furnaces, Crucibles, Brass and Steel Wire Screens, etc., including all the necessities for Assayers and Miners, as also for Milling men. An experience of 30 years in this line of business enables me to guarantee a trial attendance to the orders which my friends may entrust to me. Gold and Silver Tables and a full list of articles to be found in my store, to be had on application.

Patent Mill and Street Lamps to Burn Coal Oil, Naptha and Gas.

### BOESCH'S PATENT

Hydraulic Mining and Locomotive Head Lights, with the Latest Improvements, making them the best and cheapest in the market.

**Pacific Lamp and Reflector Factory.**

569 Mission Street, San Francisco.

### Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 53.

## SAVE YOUR GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me from 500 pounds to a ton of their ores, that I can save from 25 to 100 per cent. more than any other machinery now in use. I will make no charge.  
Machinery can be seen in operation every day at No. 143 Fremont Street.

M. B. DODGE.

### BOILER COVERINGS.

Plastic Cement and Hair Felt, with or without the Patent "AIR SPACE" Method. Cement ready for use by the barrel.

G. C. FOWLER, No. 413 Pacific St., S. F.

### W. N. LOCKINGTON,

520 FIFTH ST, cor. Bryant, San Francisco.  
Assaying and Amalgamating, Ores Tested, Jewellers' Sweeps Worked.

## An Improved Electro-Medical Apparatus.

(CONTINUED FROM PAGE 161.)

The switch, *L*, breaks or closes the circuit in the positive or negative poles. The six-lever switch, *K*, connects all the before-mentioned parts of the apparatus together. No part or parts can be used unless the levers controlling their action be moved to the right or the left as the case may be.

The entire apparatus is so arranged that no shock can be given unless special combinations are used for that purpose.

Dr. Williams is now erecting a stationary apparatus for administering medicated vapors to the lungs, throat and nasal passages for disease of those parts. It is intended to use electricity to illuminate the parts for purposes of examination.

## The Powder Explosion.

The explosion which occurred in the works of the Eureka powder company, near Berkeley, on Friday last, has drawn public attention once more to the manufacture of high explosives. Four Chinamen were killed outright and seven other persons were more or less seriously injured. The company is a new one, and they have only been manufacturing some three weeks. The officers of the corporation are N. K. Masten, President; Samuel Rosener, Treasurer; C. Van Dyck Hubbard, Secretary; Max Tschirner, Superintendent.

One theory of the cause of the explosion is that a Chinaman was smoking a pipe. Another is that some of the powder became scattered on the turn-table and became ignited by friction. Another is that it was caused by "overheating." Whatever the cause the explosion occurred and loss of life was the result.

The Eureka powder contained in its component parts chlorate of potash and picric acid, substances which are very dangerous to handle. There have been frequent examples of explosions from picric acid being used in the dyeing of wools. This is so well known that the use of powders from it and from chlorate of potash are prohibited in both England and France, and all the authorities are agreed upon its dangerous qualities. These are mentioned in Wagner's technology, Fownes' chemistry, Thompson's encyclopaedia of chemistry, the American encyclopaedia and elsewhere. The wonder is that an attempt should have been made to manufacture powder from these experiences, when their tendency to explode is so well known.

The *Post*, of this city, has an excellent article on this subject, explaining it so well that we can do no better than copy a portion of the remarks. This Eureka powder contains elements which, alone and unmixed, are frightfully dangerous, and when conjoined, doubly so. An eminent apothecary ventures the assertion that chlorate of potash will sometimes explode of its own gravity when loose and put in a box; and that when made into cartridges, the lower part is very liable to explode under pressure. Picric acid, which is mixed with the chlorate of potash, is also an explosive. The crystals are of a bright straw color, and used largely in dyeing silks, gloves, etc. Whole piles of silk dyed with this compound have been known to explode, and its mixture with chlorate of potash renders the powder made from it the most unsafe material known. There is terrible danger in mixing chlorate of potash with either sulphur, cyanide of lead, phosphorus, cinnabar, or even sugar. Picric acid is made chiefly by the decomposition of carbolic acid by means of nitric acid. Hafeneegger, who had two patents on the manufacture of explosives, hoped to overcome the danger of using chlorate of potash by combining it with fatty substances, such as butter, lard, tallow and oil; but the first experiment made with it killed the man who was loading the mortar, and Hafeneegger afterwards always kept away from his own experiments. The list of accidents from experiments with chlorate of potash as an ingredient of explosives is innumerable. A well-known chemist has written of it: "This astonishingly powerful compound was first discovered by the celebrated chemist Berthollet, in 1785, who proposed to substitute it for common gunpowder. When he first formed this salt he named it oxygenized muriate of potash. It appears to include the elements of thunder in its composition, and nature has concentrated all her powers of detonation, fulmination and inflammation in this terrible compound. A great many individuals have lost their lives or been dreadfully wounded in their attempt to manufacture gunpowder or blasting powder with this salt, and the lives of the two first workmen employed by Berthollet were sacrificed to the experiment, for immediately they began to triturate the ingredients they exploded with such violence as to blow them to atoms and destroy the whole building. This was in 1785, and for nearly a century, chemists have in vain endeavored to control the dangerous element. If only three grains of a mixture of chlorate of potash and any of the elements above mentioned are struck with a hammer upon an anvil, the report is as loud as that of a gun. The writer proceeds to show that the greatest objection to chlorate of potash is that it will ignite even by friction, and that its manufacture and use is too dangerous. It has already had its quota of victims on this coast. This does not imply, of course, by reversing the argument that all other

powders are safe, for carelessness often causes accidents, even in the manufacture of common gunpowder, but it does show that the powder under discussion cannot be either manufactured or used with any degree of safety. There are powders which can, with ordinary precaution, be manufactured and used without any danger, but none where chlorate of potash and picric acid are among the ingredients.

However, the purpose is not to show whether one explosive is safe and another fearfully dangerous to handle, but rather to put before the public the question as to whether an explosive ought to be made which contains such a fearful element as a combination of chlorate of potash and picric acid. In Dr. Ure's Dictionary of Arts (vol. 2, page 321) he says: "Picric acid was discovered in 1788," etc. "It is now readily manufactured from the coal tar product known as carbolic acid. This, when mixed with saltpeter or chlorate of potash, particularly with the latter, furnishes products which in violence of action more nearly resemble gun cotton and nitro-glycerine preparations than does any other explosive agent. Both mixtures are susceptible of detonation by friction, and especially that containing chlorate of potash, which is, indeed, inapplicable to practical purposes on account of its dangerous nature." The subject is not one that can rest here. The public is entitled to the knowledge as to whether any or all of these explosives are safe to handle. It does not want to know what any writer thinks, but what are the facts. If the materials used in the Eureka Powder Works are as dangerous to human life as Dr. Ure and other authorities say they are, then the existence of a factory where such powder is made is not only a crime against all concerned in making it, against the community where the factory is located, but against every miner who may buy it and use it under the belief that it is safe.

All powders to which we are accustomed, can be used without danger by those who understand their properties. Dynamite, gun cotton, and even ordinary gun powder are more or less dangerous, but being from daily use familiar with them we are, with due precaution, able to utilize them with comparative security. To try and improve on the compounds which can be used safely might result in great benefit to the scientific world, but further experiments in chlorate of potash compounds seem to present obstacles which, from the inherent chemical properties of the substances used, nature itself has made unconquerable. If it can be proven that these combinations will explode spontaneously in a state of rest then their manufactures should be prohibited by law. It has been shown that the idea of the recent explosion having been caused by Chinamen smoking in the cartridge house is chimerical. Chinamen do not smoke in powder works. How it did occur will probably never be known; but if the data and points that have been gathered for this article are at all reliable, it is certain that no powder should ever be made where picric acid and chlorate of potash are two ingredients. There have been railroad collisions and accidents where dynamite and other terrible explosives were among the freight, and where no harm has resulted from the concussion; but these powders, as shown, are of a far different nature, and are invaluable to the miner, without endangering his life. The question as to which is or is not the best and safest blasting powder is one which may come up hereafter; at present the point most interesting to the public is whether there are powders manufactured which endanger the lives of all who make or use them.

## Agricultural Implements.

## Manufacturing Industries.

It is only within about the last two decades that most of the farming tools and agricultural machines used on this coast were imported at great risk and immense expense, as well to our wholesale dealers as to the people who had to purchase and use them. And it is not a little strange, now, that while we have the iron, the timber and the skilled labor to fabricate everything in this line, there should still be so much importation carried on, manifestly to the serious detriment of our struggling home enterprise, and the pecuniary aggrandizement of our Atlantic manufacturers and shippers. By small increments, however, agricultural manufacturing industries are beginning to assume a prominence and importance, here at home, justly to the lasting honor of those enterprising spirits who have had the business courage to embark in these far-reaching and worthy undertakings. It matters not how lavishly a country may have been blessed by natural advantages, it cannot be said to be truly independent until such time as it has gotten to be wholly self-supplying in all those varied manufactured materials and appliances in popular use, as vital to its prosperity as the productions of its fertile soil.

We believe there is enough latent genius in our California artisans to invent and manufacture anything in the agricultural line, from the simplest plow or harrow to the most elaborate and complicated reaping or threshing machine; and we believe, too, if a commensurate inducement were brought to bear by our home dealers and home consumers, this inventive faculty could be aroused to such a degree of fruitful energy as would well surprise and startle our most sanguine people. It is hopeful to be able to state that we have already within our borders, factories where many first-class agri-

cultural implements are turned out which will bear favorable comparison with similar articles emanating from Eastern establishments. Among these, we take pleasure in calling attention to the well-known and popular Stockton Gang Plow and Manufacturing Works, Mr. John Caine, sole proprietor. This business was established in 1860, and after a 20 years' prosperous career, it is yet rapidly growing in importance.

Mr. Caine is also proprietor of the Globe Iron Works, his warehouse and office being located at Nos. 205 and 207 El Dorado St., corner of Market, Stockton, Cal. A full list and description of the articles manufactured by Mr. Caine would require a respectable volume, and we can only give a synopsis of them here. Among his agricultural appliances may be enumerated headers and mowers, derrick forks, barb fence wire, wheels, gears, pulleys, belts, Baxter's Improved Stockton headers, Stockton gang plows, etc. From his iron works he turns out steam engines, for steamboat and stationary purposes, horse power, pumps, house fronts and quartz, saw and grist mill irons. Mr. Caine is also agent for the celebrated Improved Studebaker wagone for 1880, and agent for the Pacific coast for Root's rotary force blast blowers for ventilating mines.

But enough has been said to show that these works occupy the foremost rank in the growing home manufacturing industries of the Pacific coast, and the men who thus hazard their time and money to serve the people in these great undertakings, are the ones to be encouraged and patronized.

## Mining in Mexico.

A correspondent writing to the *Leadville Circular* from Alamosa, Sonora, Mexico, says: The climate is magnificent for seven months in the 12, and we have four or five months of pretty hot weather, but can stand that better than the cold and snow. To-day the thermometer in my room stands at 58°. It ranges right along from 58° to 64°. We have occasional winter rains besides the regular rainy season, so that everything looks fresh and green. It is a country of endless resources. Everything grows here from coffee and sugar cane to Indian corn, and of the latter they raise as high as three crops a year. As for the mines, I think it is the coming country. You know better than I the amount of attention Mexico is attracting in the United States. The country is overrun with experts and agents, from Clarence King down to many not so well known. Much property is being picked up, and American capital is pouring in rapidly. If care is exercised in the purchase of properties, I see no room for failures, as good mines are plenty, mines that have produced their millions, worked in the crudest manner. It is easy to arrive at actual facts about the production of various mines, as the bullion pays a coinage tax, and the mint records show the figures. I suppose that more or less bullion is smuggled out of the country, so that a person taking the mint returns will come under rather than over the fact.

There are many desirable features of working here, and one of them is cheap labor. We utilize lots of Indian labor at 50 cents a day, and get the work as well done as you would pay \$3 a day for in Leadville, for nothing but main strength and awkwardness is required. They do as well as anybody, and even in the mines I have a lot of "teniteros" who get 75 cents a day, and they can strike a drill as good as any man you ever saw; so, you see, by putting one of these men with an experienced white miner how much it reduces the average expenses.

"A PLACE IN EVERY CABIN."—THE MINING AND SCIENTIFIC PRESS is not only full of good reading for the miners, but is wide awake to their interests, and ought to have a place in every cabin. It has a weekly "Mining Summary" gathered in goodly part from the local newspapers in the mining districts of the western States and Territories. For instance, all the important news of Georgetown Divide appearing in the *Gazette* is copied in the PRESS, thus heralding to the world the mining interests of this section. Therefore, it behooves us to publish only authentic reports of mining transactions, and we hope that those furnishing us with accounts of mines will give the real facts and nothing more.—*Georgetown (El Dorado Co.) Gazette*.

THE commencement of work to connect the Forman shaft with the Suro tunnel is worthy of notice. The Jacket drift is 1,513 ft. from the surface. The Forman shaft works are 12 ft. lower than the Jacket works. This would bring the Forman shaft drift at a depth of 1,501 ft. from the surface; or, allowing for grade, about 1,495 ft. The surveyed line of the south branch of the tunnel runs 200 ft. west of the Forman shaft, and the distance from the Jacket shaft to the Forman shaft is 3,450 ft., as the surveyed line of the tunnel runs.

THE Treasury officials estimate the surplus revenue for the remaining four months of the present fiscal year at \$45,000,000. The sinking fund will require \$8,000,000 to complete it. By the end of the present fiscal year, according to their estimate and exhibit, there will be a surplus of \$37,000,000 available, between now and June 30th, with which the Secretary may purchase and cancel bonds.

## News in Brief.

EARTHQUAKE at London and at Naples. SEVERAL lives lost by wrecks on Rockaway beach.

The report of the plague in Mesopotamia is fully confirmed.

FRANCE has decided to recall its representative in Venezuela.

SEVERE rain and snow storms on the Atlantic coast and in Canada.

BUENOS AYRES desires immigration from Ireland and Germany.

THE snow blockade continues in Illinois, Wisconsin, Iowa and Minnesota.

PORTUGAL consumed nearly as much American wheat in 1880 as Germany.

STATISTICS show Gilroy to be the chief cheese manufacturing township in the State.

MILES CITY, Dakota, has been flooded by reason of the ice gorges in the Tongue river.

THE steamer *Sultan*, with 100 emigrants on board, was sunk in the Humber, on the English coast.

The insane asylum near Danville, Pa., was destroyed by fire Saturday night. The building contained about 500 patients, none of whom perished.

A CARTRIDGE manufactory has been opened in Constantinople. It is provided with American machinery capable of turning out 30,000 cartridge daily.

It is asserted that within 18 months 2½ miles of the proposed channel between England and France will have been excavated, and that the work will be completed in about four years.

ALDERMAN SAUSS' resolution was adopted by the New York Board of Aldermen, asking the corporation counsel if there was any way of stopping the walking matchee, which he denounced as frauds.

THE Spanish treasury exhibit a deficit of \$300,000,000, the Government is overwhelmed with debt, and the revenue is on the decline. Alfonso had better go into bankruptcy or compromise with his creditors.

EVEN Asia has not escaped an exceptionally severe winter. In Japan there have been snow storms the like of which are not remembered to have occurred in 40 years. The snow is 10 ft. deep in the fields and 15 ft. on the hills.

A SERIES of most terrible shipping disasters occurred on the Aberdeenshire coast last Saturday morning, when no less than nine vessels were wrecked and 100 lives lost. One vessel was the Liverpool ship *Ben Rhydding*, from Calcutta. All the crew, 30 in number, perished within eight of land, the rocket apparatus being unable to reach the vessel.

DODSON, President of the Local Government Board, said that there were no cases of trichinosis in England. He hoped there was no real cause for alarm; but, in view of the action of foreign governments, a circular addressed to the local sanitary authorities has been printed, empowering the medical officers of the Boards of Health to carry out the provisions of the act ordering the examination of all pork exposed for sale.

THE Royal Spanish Academy has decided to open a poetical competition in London, to celebrate the forthcoming second centennial anniversary of the poet Calderon de la Barca. The contributions are to be in honor of Calderon, and in the English language. The Archbishop of Dublin, James Russell Lowell and Lord Houghton, have been appointed jurors. The successful competitor will receive the gold medal of the Academy and a diploma.

THE forged telegram designed to cause the Board of Trade to take action against American pork, were received in the House of Commons on Tuesday last, while an influential deputation from the Liverpool provision trade were actually there to interview Nundella, the Vice-President of the Councils, and to advise him against action similar to that of France. The telegram purported to be from the Secretary of the Liverpool Provision Guild. The police are investigating the matter.

It is apparent there is to be a tremendous pressure brought to bear upon the President for the removal of persons now in office, and the appointment of new applicants. At one time, Tuesday, fully 500 office-seekers were at the White House endeavoring to get an audience with the President, and present their papers. Very few were admitted, and the President said emphatically to a Senator who had called with an applicant, that he would not make any removals at present, and intended to require all papers asking for appointments to come through the proper department.

VALUABLE IMPROVEMENT IN THE BESSEMER PROCESS.—The Pittsburg Steel Casting Company are about to erect a Bessemer plant, for the purpose of making steel castings, and a superior quality of pig iron. This plant will be on an improved plan, under patents, by which they claim to be able to save 50 per cent of labor, and make ordinary Bessemer steel, and in 40 minutes change it into good open-hearth steel, or in one hour produce a steel of as good quality and more uniform than crucible steel; also, with a five-ton converter and five-ton open-hearth furnace, to produce in a given time, eight times the quantity of open-hearth steel that can be produced by the present process. Parties interested are at liberty to call and examine the models, at the works of Pittsburg Steel Casting Company, corner 26 street and Allegheny valley railroad.

The Californian.

THIS RISING MONTHLY OF THE DAY. YEARLY SUBSCRIPTION \$4. Single number 35 cents. AGENTS WANTED in every town and village of the United States to canvass for this popular magazine. The most liberal commissions will be paid to responsible parties. This is a chance to make money at your own home. Address: THE CALIFORNIA PUBLISHING CO. (P. O. Box 2310) 202 Sansome St. S. F.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St. S. F.

HALL'S VEGETABLE SICILIAN HAIR RESTORER is a scientific combination of some of the most powerful restorative agents in the vegetable kingdom. It restores gray hair to its original color. It makes the scalp white and clean. It cures dandruff and humors, and falling out of the hair. It furnishes the nutritive principle by which the hair is nourished and supported. It makes the hair moist, soft and glossy, and is unsurpassed as a hair dressing. It is the most economical preparation ever offered to the public, as its effects remain a long time, making only an occasional application necessary. It is recommended and used by eminent medical men, and officially endorsed by the State Assayer of Massachusetts. The popularity of Hall's Hair Restorer has increased with the test of many years, both in this country and in foreign lands, and it is now known and used in all the civilized countries of the world.

FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving specimens of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their notions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

How to STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and each binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry O. Hanks, State Mineralogist.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

OFFICE OF THE

Northern Belle Mill and Mining Company.

SAN FRANCISCO, MARCH 10, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, a dividend (No. 11) of Fifty (50) Cents per share, was declared payable on Tuesday, March Fifteenth (15), 1881. Transfer books closed on Saturday, March Eleventh (11), 1881, at 3 o'clock P. M.

WM. WILLIS, Sec'y.  
Office—Room 29, Nevada Block, No. 300 Montgomery Street, San Francisco.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

SAN FRANCISCO, MARCH 2, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, a dividend (No. 26) of Seventy-five (75) Cents per share, was declared payable on Saturday, March Twelfth (12), 1881, at the office in this city, or at the Agency of the Nevada Bank of San Francisco, in New York.

WM. WILLIS, Sec'y.  
Office—Room 29, Nevada Block, No. 300 Montgomery Street, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE

Silver King Mining Company.

SAN FRANCISCO, MARCH 1, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, a dividend (No. 15) of Twenty-five (25) Cents per share was declared, payable on Tuesday, March Fifteenth (15), 1881, at the office of the Company, Room 19, No. 328 Montgomery Street, San Francisco, California. Transfer books will be closed March 10, 1881.

JOSEPH NASH, Sec'y.

ANNUAL MEETING.

Notice is hereby given that at a meeting of the Stockholders of the Paris Mining Company will be held, in accordance with the By-Laws of said Company, at the office of said Company, Room 25, No. 310 Pine Street, in the City and County of San Francisco, California, on Tuesday, the Twenty-second (22) day of March, A. D., 1881, at one o'clock P. M., of said day, for the annual election of Directors, and the transaction of such other business as may properly come before the meeting. Transfer books will be closed on Friday, the Eighteenth (18) day of March, 1881, at three o'clock P. M.

WM. J. TAYLOR, Sec'y.

Office—Room 25, No. 310 Pine Street, San Francisco, California.

Booth Gold Mining Company.—Location of principal place of business, San Francisco, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment No. 3, levied on the second day of February, 1881, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the eighth (8) day of January, 1881, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, No. 10 Market Street, on Monday, the fourteenth (14) day of March, 1881, at the hour of 2 o'clock, P. M., of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

WM. H. KNIGHT, Sec'y.  
Office—No. 10 Market Street.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates

This paper is printed with ink furnished by Chas. Eneu Johnson & Co., 609 South 10th St., Philadelphia & 59 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorey, 527 Commercial St., S. F.

INCERSOLL

ECLIPSE ROCK DRILLS.

The Most Economical Air Compressor in the Market.

MINERS' HORSE-POWER.

One Horse can easily belt over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is hoisted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX,

49 Fremont St., S. F.

NOTICE.

TO ALL WHOM IT MAY CONCERN: Notice is hereby given that George Denton Cardew is no longer a Director of the Isabelle Gold and Silver Mining Company, of London, England, Limited, and that any Power of Attorney which he may have had from said Company was invalid, for the reasons set forth in the following Resolutions:

1. Resolved, that as the Power of Attorney given to Mr. Geo. Denton Cardew on the 24th of August last, was not duly authorized, and the seal of the Company was affixed thereto without the authority of a duly constituted Board of Directors, the Directors of the Company hereby repudiate all acts and things done, or caused to be done by Mr. G. D. Cardew, under or by virtue of such Power of Attorney, and that by way of caution the Directors of the Company do rescind the said Power of Attorney, but without in any way recognizing the validity of such Power of Attorney, and such Power of Attorney is hereby rescinded accordingly; and that the solicitor of the Company inform Mr. G. D. Cardew of this Resolution, and request him to return to the office of the Company, the said Power of Attorney.

2. Resolved, that the Solicitor do forward a copy of the said Resolution to Mr. Lewis Chalmers, the Manager, at the Mines, and request him to advertise in such papers in California as he may think necessary, the said Resolution, or the purport thereof; and also the fact of Mr. G. D. Cardew having resigned the office of Director of the Company.

By order of the Directors, LEWIS CHALMERS, Manager.

DEWEY & CO.,

American & Foreign Patent Agents.

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## Iron and Machine Works.

### ÆTNA IRON WORKS,

PENDERGAST, SMITH & CO.,

MANUFACTURERS OF

### IRON CASTINGS

### and MACHINERY

OF ALL KINDS.

217, 219 and 221 Fremont Street,

Between Howard and Folsom,

San Francisco.

### SACRAMENTO BOILER WORKS,

214 & 216 BEALE St. (rear of Ætna Foundry),

J. V. HALL,

PRACTICAL BOILER MAKER.

Marine, Stationary and Portable Boilers, Smoke Stacks Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

### ALL KINDS OF SHEET IRON WORK,

Repairing promptly attended to at the lowest possible terms.

### UNION IRON WORKS,

SACRAMENTO, CAL.

ROOT, NEILSON & CO.,

MANUFACTURERS OF

### STEAM ENGINES, BOILERS AND ALL

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.

Front Street, Between N and O Streets,  
SACRAMENTO, CAL.

### Golden State & Miners Iron Works,

Manufactures Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

### California Brass Foundry,

No. 125 First Street, Opposite Minna.  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. **PRICES MODERATE.**  
J. H. WEED. V. KINGWELL.

### California Machine Works,

WM. H. BIRCH, Prop'r.

119 Beale Street,

San Francisco.

General Mechanical Engineer and Machinist. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturer of Brodie's Patent Rock Crushers and Steel-Exed Tappets. Agent and Manufacturer of F. A. Yonck's Patent Steam Packing Rings for Steam Pistons. The best ever invented; can be applied to any Engine. Piston and give entire satisfaction to those using. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

### STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

THOMAS THOMPSON.

THORNTON THOMPSON.

THOMPSON BROTHERS,

EUREKA FOUNDRY,  
and 131 Beale St., between Mission and Howard, S. F.

MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

### DODGE'S

### UNEQUALLED

### Concentrating Machinery

FOR CONCENTRATING GOLD, SILVER,  
LEAD and COPPER ORES.

Furnaces for Roasting and Chloridizing Ores, for Amalgamation or Leaching. Plans, Drawings and Estimates for Working Ores by any Process.

M. B. DODGE,

143 Fremont Street, S. F.

**WIND MILL.** One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

Established in 1850.

### RANKIN, BRAYTON & CO.

Office—127 First Street, San Francisco, Cal.

### Builders of Engines, Boilers, all Classes of Machinery.

PLANTS FOR GOLD AND SILVER MILLS,  
Embracing the latest and most Improved Machinery and Processes for Base and Free Gies.

WATER JACKET SMELTING FURNACES.

For both Galena and Copper Ores of the Most Improved Construction.

Having built nearly every successful working Furnace on the Coast, we are prepared to guarantee the best results attainable in all classes of Ores.

HOISTING AND PUMPING MACHINERY,

Embracing all Known Improvements.

WHEELOCK'S AUTOMATIC CUT-OFF ENGINE,

Beyond Question the most economical and perfect working Engine now made.

WALKER'S COMPOUND STEAM PUMPS,

The best in use. Will work with thirty per cent. less steam than any other Pump in the market.

Sole Agent for HOWELL'S IMPROVED WHITE FURNACE.

The only successful Chloridizing Furnace made Over fifty of them in use on this Coast.

Parties Wanting any kind of Mining Machinery are requested to send for Illustrated Circular.

## William Hawkins,

(SUCCESSOR TO HAWKINS & CANTRELL).

### MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturer of

### IMPROVED PORTABLE HOISTING ENGINES,

FOR MINING AND OTHER PURPOSES.

Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warshouses and Public Buildings.

### Steam Engines and all Kinds of Mill and Mining Machinery.

L. C. MARSHUTZ.

T. G. CANTRELL.

## National Iron Works.

Northwest Cor. Main and Howard Sts., San Francisco.

MANUFACTURERS OF

### IMPROVED PORTABLE HOISTING ENGINES.

Stationary and Compound Engines, Quartz Crushing and Amalgamating Machines, Flour, Sugar and Saw Mills.

SOLE MANUFACTURERS OF

Kendall's Patent Quartz Mill, National Ore Feeder & Concentrator.

CASTINGS AND FORGINGS OF EVERY DESCRIPTION.

## Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

### RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDGE AND MACHINE BOLTS, LAG SCREWS, NUTS, WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

HIGHEST PRICE PAID FOR SCRAP IRON.

Orders Solicited and Promptly Executed.

Office, No 202 Market St., UNION BLOCK.

GEO. S. LADD, President.

ANDREW WHITE, Secretary.

134 Sutter Street, San Francisco.

Telegraph Supplies, Instruments of all Descriptions.

FIRE ALARM TELEGRAPH BOXES, GONGS and BELL STRIKERS,

Model Machinery, Patent Office Models, Electro-Magnetic Blasting Machines and Supplies.

### AMALGAMATING PLATES.

1 oz. of Silver Deposit to 1 square foot for \$3.

All orders promptly attended to.

PAUL SEILER, Superintendent.

Corner Beale and Howard Sts.,

SAN FRANCISCO, CAL.

W. H. TAYLOR, Pres't.

JOSEPH MOORE, Sup't

### Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

### Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

### San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLGT GUT and SLGT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

THE CALIFORNIA POWDER WORKS.  
MANUFACTURERS OF  
Sporting, Cannon, Mining, Blasting and  
HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.  
No. 2 is superior to any powder of that grade.  
PATENTED IN THE UNITED STATES PATENT OFFICE.  
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.  
JOHN F. LOHSE, SEC'Y.  
Office, No. 230 California Street - - - San Francisco, Cal.

PACIFIC POWER CO.  
Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

MENZO SPRING.  
Manufacturer of the Best  
Improved Artificial Limbs.

9 Geary Street, Junction of  
Market and Kearny, S. F.

## AVERILL MIXED PAINT.

THE PIONEER IN MIXED PAINTS. Is prepared ready for immediate use, and of any Shade or Color desired. Any one who can handle a brush can apply it. It is impervious to our damp atmosphere, and is equally as good on Wood, Stone or Iron Work.

It does not Crack, Chalk or Peel Off, but retains for years that beauty of finish for which it is so justly celebrated.

Sample Cards of Colors, Testimonials and Price List furnished free, on application to

O. S. ORRICK, General Agent for Pacific Coast.

403 Market Street, - - - - - Opposite Front, San Francisco.

## HYDRAULIC GRAVEL ELEVATORS,

For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY,

No. 51 Fremont Street. Office of the Hydraulic Gravel Elevating Mining Co., S. F.

WILLIAMS, DIMOND & CO.

202 Market Street, San Francisco

## EXCELSIOR BLASTING POWDER

MANUFACTURED BY THE

Excelsior Powder Company.

This is no so-called "safety" Powder, but a powerful explosive, and as safe to handle and use as any nitro-glycerine Powder on the continent. There is no headache or nausea in the use of this Powder, as the noxious fumes are entirely done away with. It is put up in cartridges of any size to suit consumers and is exploded with cap and fuse, the same as any other high explosive. The following testimonial is a sample of hundreds of the same tenor being constantly received.

GOLD HILL, August 17, 1880.

AGENT EXCELSIOR POWDER CO.—Dear Sir:—I have used your Powder in test cement and hard blasting rock, and find it superior to any Powder in use on the Comstock. It does its work effectually, and does not leave the person using it with a severe headache, like the other Powders do to the majority of miners. In recommending it I would suggest, give it a fair trial and I am confident it will speak for itself. Wishing your Company success,

I am respectfully yours, GEORGE CLARK, Foreman Sierra G. and S. M. Co.

Address all orders to

Excelsior Powder Company, Room 40, Merchants' Exchange, SAN FRANCISCO, CAL.

A. S. HALLIDIE,  
OFFICE, NO. 6 CALIFORNIA STREET,  
SAN FRANCISCO.

## \$1,000 CHALLENGE!

### THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of \$1,000 each, and we mean business.

ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

## VULCAN BLASTING POWDER.

THE MOST ECONOMIC AND BEST TRO-GLYCERINE  
EXPLOSIVE IN MARKET.

For the year 1881, we are prepared to make MOST LIBERAL ARRANGEMENTS. Having unequalled facilities we are in position to offer BEST TERMS, and purchasers will serve their own interest by conferring with the Company, before concluding arrangements elsewhere.

NOS. 1, 2 AND 3 VULCAN,

TRIPPLE FORCE CAPS,

And all Grades of Fuse at Bottom Rates.

VULCAN POWDER COMPANY,

212 California St., San Francisco, Cal.

AIR COMPRESSORS  
PRICES REDUCED. SEND FOR NEW CATALOGUE.  
CLAYTON STEAM PUMP WORKS  
14 AND 16 WATER STREET, BROOKLYN, N. Y.

J. H. WYTHE, M. D.

# MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, MARCH 19, 1881. VOLUME XLII Number 12.

## Underground Surveying.

Although several improvements have been made during the past few years in the construction of the theodolite and dial, and these instruments are now considered perfect for all practical purposes, there are, however, other instruments which the mining engineer and surveyor must use, and the much greater accuracy which is now necessary in making mining plans, to prevent encroachment and consequent litigation, makes it desirable to use the best instruments for securing precision. One of the defects of the present system of surveying is the method of transmitting a mark from the center of the dial to the roof of the tunnel or drift. The usual practice is to hold the line and plumb-bob with one hand above the instrument, and after getting the center the hand is removed to allow the mark to be made on the roof with the other hand. This method is too much dependent on guesswork, and for accurate operations, say, in the case where two headings have to meet, surveyors, although it sometimes entails a large amount of extra work, prefer to go over the whole distance again rather than rely on a mark made in this way. To overcome these difficulties, an English mining engineer, Mr. W. E. Garforth, of Normanton, has designed an arrangement of adjustable plumb-hob and holder, which we illustrate in the accompanying drawings, taken from the *Engineer*.

From this it will be seen that Mr. Garforth's new instrument, which is very ingenious and extremely neat in design, consists of a small brass box plate—with projections to prevent slipping when placed against the roof of the mine—on the under side of which the rack, C, is arranged to move backwards and forwards the projecting arm, which can likewise be worked at right angles by the second rack, D. By means of these motions the string connected with the plumb-hob can be moved to any required position by the wheels. A and B, which, although placed on one hollow spindle, work independently of each other. At the extremity of the arm a duplex center or gimbal motion—similar to that in use for suspending a ship's compass—is arranged to hold the rod, R, through which a string passes, to which is attached the plumb-bob which causes the rod, R, to hang in a perfectly vertical line whatever the inclination of the roof of the mine. The movable slide, T, which is bored to fit the rod, R, when lifted upwards either by a spring or by hand, as preferred, is consequently obliged to move in a perpendicular line. An adjustable screw cap, in which is placed the chalk or needle, is fitted to the upper end of the slide. The plumb-hob, L, is arranged with a lock nut, H, so as to allow the string between the instrument and the roof to be lengthened or shortened as required, and to obtain greater accuracy the plumb-bob has a long, adjustable, coarse-threaded screw, K, to enable the point of this plumb-bob to be brought in the closest contact with the glass of the instrument.

Now, assuming it is required to transmit a mark, the "dial center" is placed against the roof of the mine, the string adjusted first by the lock nut, H, and afterwards by the screw, K, the screws A and B, are then worked until the plumb-bob hangs exactly above the center of the dial, when the slide—which, for the reasons already explained, is caused to hang vertical—is next moved upwards, and the center mark made in the roof. To obtain even greater accuracy, and when the mark has to be made on timber, the screw, M, can be attached to the movable slide, and instead of a chalk mark a loose needle can be pressed and left in the plug or timber.

Mr. Garforth's "dial center" will, without doubt, prove a most useful adjunct to the dial, and a means of saving considerable time in setting out lines is now almost daily required, especially in those collieries where an extensive system of chain or rope haulage is at work, and where straight roads are found to work so much more advantageously, as compared with crooked roads. The plumb-hob used by itself will prove of service to architects and engineers, as there is often a loss of time in having to lengthen or shorten the line, which is so quickly adjusted by the arrangement shown.

## Selling Mines.

It does seem queer, when you come to think of it, that people who own what they consider good mines, always seem willing and even anxious to sell them. When a man goes to a new mining camp, he finds several dozen mines, which he is told are first-class, which can be bought cheap. Almost any of them will show ore running from \$100 to \$1,000 per ton, with several tons on the dump, and several hundred more in sight. Yet this mine will be sold—at a high price—for a couple of thousand dollars, or even less.

It seems as if the spirit of "trade" in mines is as firmly fixed as that of "trading" in horses. A man may own a horse which has all the points to make up a perfect horse—as every horse is supposed to have—and yet he will trade him off at the slightest provocation.

It is the same with a mine; especially a new and slightly developed one. The owner may

## Mining Statistics of the State of Nevada.

This State, according to the recently published report of A. J. Hatch, Surveyor-General, contains at the present time 108 ore-crushing mills and 26 smelting furnaces, by which latter there were last year smelted 98,825 tons of ore; 1,168,465 tons of ore having been milled meantime. Seven pan mills worked over 119,523 tons of tailings. These reduction works are of very variable capacity, each being able to put through from 2 or 3 to 40 or 50 tons every 24 hours. There are 10 mining ditches in the State having an aggregate length of 51½ miles, and a carrying capacity of 20,413 inches of water; also 569 irrigating ditches having a total length of 1,941 miles, and capable of irrigating 89,322 acres of land, 4 inches of water being used per acre. One borax mill located at Teal's marsh, Esmeralda county, manufactured 371 tons of refined borax.

The amount of mineral land in the State is

## Mining and Railroad in Mexico.

There is considerable excitement both as regards railroading and mining in Mexico. The mines are mostly discovered and being worked, but the railroads are mainly as yet on paper. It is not probable that the conservative people of that country will view the advent of American miners and railroad men with great rejoicing. Nor is it likely that the new roads will go through the country as cheaply and early as was expected. The inhabitants will in all probability throw every obstacle they can in this way. A dispatch from Tucson, Arizona, on the 16th says that parties in from northeastern Sonora report that the politicians of that State are very much opposed to the extension of the railroad in that direction, believing that it will result in virtually turning the Government over to Americans. The railroad is now replacing its Indian with white labor, and expects to push work much faster than heretofore. The railroad company also find considerable objections to locating the line of the road through Mexican ranches along the river bottom in the neighborhood of Ures.

The cheap labor calculated upon by the railroad contractors is not going to be as cheap as expected, since the laborers will soon learn that they are "worthy of their hire." A correspondent of the *Bulletin*, who is at Paso Del Norte, Mexico, writes that wages have advanced there. He says: "Laborers now receive 75 cts. per diem, being just double what they received a few months ago. Out of the 37½ cts. they had to provide their own food, and as the payment was in the copper money of the country, which is valued 10% below Mexican silver, and 20% below United States money, it will be seen that Mexican laborers have heretofore received less remuneration for their toil than the Chinese in California. There is quite a probability of a further advance in the price of labor here, as some Mexicans have been employed by railroad contractors on the American side at \$1 per diem and their board, and the contractor of the Texas-Pacific has advertised for 200 laborers at the same rate. As it is understood that grading will be commenced on this side of the river upon the return of the surveying party, a large number of Mexicans will find employment at wages approximating to those given on the American side. For an improvement in their condition, the laboring class of Mexico will be indebted to American enterprise, as under the sway of the European commercial element, which has dominated the country and retarded its prosperity, there was no hope for them."

A NEW INSTRUMENT FOR UNDERGROUND SURVEYING.

strikes a bonanza any moment, yet he is ready to take ready cash and let the next man have the chances for the bonanza. This has always been so, and probably always will be so.

Men will sit contented on a little dump at the mouth of a prospect hole, and wait for a purchaser, when a few blows of a pick might show them their fortune. But they know by bitter experience that the next blow may show them that their ledge has "pettered." They prefer the sure thing of the sale to the doubtful thing of working the mine. If there is any other reason we do not know it.

**THE NEW CONSTITUTION AND MORTGAGES.**—Judge Denson, of the Superior Court at Sacramento, has decided in an important case, that where a mortgage was given prior to the adoption of the new Constitution, the tax upon it must be paid by the mortgagee; that the new Constitution, directing a tax on mortgages, does not thus change a pre-existing contract, but only imposes a tax upon that which before was stipulated in the mortgage, an authority to the mortgagee to pay the taxes on the property, if the mortgagor failed to do so, and that such payment by the mortgagee should be covered and secured by the mortgage. The mortgagee paid the tax and sought to recover it with the debt, under foreclosure.

**TRAVEL** Bodieward from Virginia City is slightly on the increase.

estimated at 1,135,960 acres; grazing land, 5,606,061; timber land, 590,811, and farming land, 107,876 acres. Through the 9 wood flumes, 69 miles in length, there were last year floated 118,000 cords of wood and 28,000,000 ft. of lumber. The 17 railroads that traverse different sections of the State have a total length of 702 miles, this being exclusive of the Carson & Colorado narrow gauge road, of which nearly the entire track is graded and a portion laid with rails, 125 tons of mineral coal were mined and over a million tons of charcoal burned last year. From the Osceola mines, about the only placer mines now being worked in the State, \$30,000 worth of gold dust was collected. The assessed value of real property amounts in the State to \$10,984,331; personal to \$7,438,795; population, 59,529; voters, 18,889.

**THE NEW OVERLAND ROUTE.**—The telegrams from New York state that passengers by the new route—Atchison, Topeka & Santa Fe and Southern Pacific roads—left that city on Tuesday last. The passenger rates agreed upon between the Southern Pacific and the Atchison, Topeka & Santa Fe railroads are: From Los Angeles to Kansas City, unlimited first-class, \$112; limited first-class, \$104; limited second-class, \$78; limited third-class, \$52.50; from Los Angeles to New York, first-class, \$133.50; second-class, \$105; third-class, \$65; from San Francisco to New York by the southern route, the same as the Central.

**A SEVERE TEST.**—During the trial trip of the English steamship *Gainsborough*, a few weeks ago, the engines were stopped and altered from hard ahead to full speed astern in 23 seconds. The steamer is 231 ft. long, with a measurement of 1081 tons. The engines are of the compound, direct acting, inverted cylinder type, 150 nominal horse power, having cylinders 32 inches and 62 inches diameter, by 36 inches stroke. She made 12 knots.

**A COMPRESSED-AIR locomotive**, intended for underground work, ran 11 miles the other day, the engine commencing with an initial pressure of 1,000 lbs. to the square inch, and running down to 300 lbs. The load weighed 20 tons.

In the immense city of London the whole staff of firemen is only 483, very far less than one man for every thousand houses, and about one for every eight thousand people. Fires are increasing, as well they might.

The tunnel under the English channel will cost £200 per yard, or £352,000 per mile, being less than half the cost of the metropolitan lines, in which the cost of land is an important, though undistinguished portion.

The *Territorial Enterprise* says: It is rumored that the honanza people have bought the Wells-Fargo property, and will sink there another large east shaft. The report is generally believed in mining circles.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eos

### Review of the Beet-Sugar Industry in the United States During 1880.

EDITORS PRESS:—It is the custom in all sugar-producing countries, when the season is over, to lay before the public the general result of the season's work, and to point out the advantages or disadvantages encountered during that time, in order to form a correct judgment how to overcome them another season, if such a thing is possible.

In every beet-sugar producing country the manufacturers meet annually for three days, and discuss the whole industry from an agricultural, commercial, mechanical, economical and political standpoint. Thus it has been since the industry was in its earliest infancy, and this system of mutual consultation has no doubt done more than any other to bring the beet-sugar industry to the immense importance it at present occupies in nearly every European country. Could this be done in the United States, the result would unquestionably be the same; the difficulties exposed would be understood and might be overcome. Unfortunately, the territory of the United States is too large, and the harmony among the beet-sugar manufacturers too small, to accomplish a meeting of all the parties engaged in it; we have, therefore, to be content with a general review, and draw our conclusions therefrom.

During the year 1880-81, six beet-sugar manufactories have been to work; three in the Eastern States and three in California. While one has been standing still in California (the one at Soquel), another has had not even all its machinery tried (the one at Los Angeles); so that we might say more correctly five beet-sugar factories have been to work in the United States during the year 1880-81.

In the Eastern States, the beet-sugar factory at Portland, Maine, had its third and last season. It made, early in spring, contracts with 1,220 farmers for the cultivation and delivery of sugar beets. The result of all these contracts was to supply the factory with raw material for only seven weeks. Part of the machinery at Portland was made in Europe, and part in the United States; the whole worked satisfactory, the largest single day's work being done converted 185 tons of beets into sugar. Although the Maine Beet-Sugar Company had a subsidy from the State amounting to \$7,000 annually, yet the Board of Directors called a stockholders' meeting for the 2d of February to decide regarding the closing up of the works and selling the property of the company, which, it has been understood, was sold to a company in New York State. As a singular fact it may be stated here that, according to the official statement of the officers of the company, made to the Secretary of State under oath, the company made during the first season, employing the most simple home-made machinery, a little more sugar out of a ton of beets than they did the second and third seasons with the most complete imported machinery.

The Delaware Beet-Sugar Company worked for the second season this year. Their machinery is entirely of American make, and worked very well. The sugar they made was sold at satisfactory prices, and had they worked as many months as they worked weeks, would have had a very profitable run; but this was not possible for the want of raw material.

The beet-sugar works at Franklin, Mass., had the past year its first season. The complete machinery was directly imported from Europe, and embraced all that art and science have produced during the last years. The manager was also brought from Europe, and the building erected according to European plans. This sugar factory worked well, though not better than the other two, and during the four weeks' work was anything but a financial success; and, what is worse, there is no prospect that the year 1881 will bring to either of these factories a full supply of beets.

The quality of the sugar beets has been about equal to the average French, with from 10% to 11% of sugar; 73% to 80% of purity; but the price, independent of general expenses, has been nearer \$7 than \$6 per ton, delivered in the factories.

Neither of these three beet-sugar factories has the elements of life in it. Without a sufficient supply of raw material, at fair prices, no financial success is possible, and without this, no industry can exist for any length of time. In former years the managers were blamed for all financial shortcomings, and the result was the hitherest recriminations among the leading men, who lost entirely sight of the axiom: Without sugar beets no beet sugar.

In California the beet-sugar works at Alvarado had an average season's work and a fair supply of beets at moderate price. The machinery employed there is of a promiscuous nature, partly made in Europe and remodeled here, and partly made here in the first place. The quality of the beets is good, and the only apparent drawback appears to be the difficulty of keeping the beets for a sufficiently long winter campaign. If the beets are placed in silos, as is the general custom in Europe, they will

heat and sprout in a wonderful short time, and if placed within easy reach of the factory, they are apt to suffer from frost at night and warm sunshine during the following day. This prevents the season to be carried into the spring, as it would be most desirable to ensure financial success.

The sugar works at Isleton had a short revival this year. The machinery was made partly in Bohemia and partly in San Francisco. The machinery is old-fashioned, and rather miniature, though good sugar can be produced with the same; but the location on an island in the Sacramento river, with its water level generally above the beet fields, is a most unfortunate one. These circumstances, taken all together, a financial success could hardly be expected.

It begins to be well understood that the beet-sugar industry will eventually gravitate to localities where the raw material can be obtained in ample quantities, of a fair quality and at moderate prices; in fact, where the sugar beet can find a home. The raw material, and not the machinery, is and has been the great obstacle to success, and although complete and sufficient machinery is very desirable, and to financial success essential, yet when the first barrel of beet sugar was made in Illinois, at which Bro. Emery, editor of the *Prairie Farmer*, assisted, and at which empty nail kegs were substituted for charcoal filters, he declared enthusiastically: "It is easier to make a barrel of beet sugar than to boil a pot of good mush."

While all the difficulty the beet-sugar industry has encountered in the United States during the season 1880-81 points in the same direction toward the supply of raw material; while the machinery in all the sugar works has done equally well, whether made of the newest pattern in Europe or made at home, we find a most singular exception in the Los Angeles enterprise. The farmers in Los Angeles county took with the most surprising readiness to raise sugar beets. Ten times the quantity desired could have been contracted for. The cost of raising sugar beets proved to be less than anticipated, and the result unexpectantly good. The quality of sugar beets proved to be of a fair average, and the attempt to dry them by solar heat on the fields on which they were grown, a most perfect success, although not all the drying turned out well, for want of the necessary care and attention. Sugar beets planted in January and February last year were fully ripe in July, and could have been worked into sugar since then at any time up to the present day directly from the field. There are hundreds of acres of sugar beets standing in the field in as fine a condition as any sugar manufacturer could wish to see and work. Farmers feed them mostly to their cattle, and yet they express not only a willingness to raise another crop, if there is a chance to manufacture them into sugar, but are really anxious to do so.

In no part of the United States can sugar beets be grown with such a facility and produce so sure a crop at so small a cost, as in southern California, and though this industry met with a set back last year through the blunders of those engaged in it, yet it is not impossible that eventually sugar factories will locate here. Whatever may be said of the wine and fruit raising advantages of southern California, farmers are pretty unanimous in the opinion that it is no grain growing locality, while root crops are every year sure and immense. Had any one of the three Eastern beet-sugar factories had the large and cheap supply of sugar beets of Los Angeles they would have coined money, notwithstanding that sugar in the East is from 2 to 2½ cents per lb. cheaper than in California.

If the peculiar advantages and disadvantages of the beet-sugar industry in the United States has encountered in the different localities where its introduction has been attempted is once correctly understood, a great step towards success has been accomplished.

ERNEST TH. GENNERT.

Los Angeles, Cal.

THE COAL FIELDS OF ARIZONA.—Of the extent and character of the recently discovered coal fields in Arizona, the *Journal* says: "The valley on Deer Creek is about 10 or 12 miles long, and forms a natural basin. Last Wednesday, George Martin and George Cook in prospecting found croppings, shale and ledge matter, which cover almost the entire surface of from 800 to 1,000 acres of land. The ledges in several places crop out, with a dip of 20° to the southeast. From breaks in the surface of the land and a washout where the water has cut through, it is evident that one of the ledges is at least 20 ft. thick. The others will have to be prospected before the owners can determine their extent. It is certainly a wonderful discovery of magnificent coal beds. The discoverers brought some fine samples to town, which were tested yesterday in a blacksmith shop, and they burned beautifully. It is bituminous coal of a superior character, specially adapted to railroad or machinery of any kind. In the last few days persons have gone thither, and are prospecting the valley in search of coal. Many locations have already been made. These coal fields are about 18 miles from the San Pedro valley, and can be reached by a road going up Deer Creek valley. The line of the projected railroad from Globe to Tombstone is right along that valley. Messrs. Martin, Cook, Oates, Wicks and others have taken up two sections of 160 acres each, and propose to commence operations in connection with the same at an early date.

### The Murchie Mine.

During the 11 months ending Dec. 31, 1880, the Murchie mine, Nevada county, as stated in Supt. Schuyler's annual report, has produced 5,924 tons of ore, the percentage of sulphurets being 3.76. The product was as follows:

5,924 tons of ore worked by company, 1,614 ounces bullion.....	\$26,313.07
70 tons sulphurets worked by company.....	676.01
139 tons sulphurets worked by Pioneer reduction company, of Nevada City.....	16,574.98
37 tons worked by Ireland & Aaron, Melrose.....	5,512.24
40 tons of sulphurets sold abroad.....	4,934.00
31 tons of first-class ore worked at Pioneer reduction works.....	1,935.00
Total.....	\$50,210.30

The average yield per ton was as follows:

Free metal.....	\$4.42
Sulphurets.....	4.90
Total.....	\$9.32

The cost of mining, milling and reduction of sulphurets was \$8.37 per ton.

During the same period the company has sunk a new three-compartment shaft, which is now at a depth of 404 ft. The various levels have been extended 2,530 ft. A 78-ft. winz has also been sunk. A commodious shaft-house has been erected, and new and powerful hoisting machinery set therein. The total amount expended on the mine and in making these improvements is \$98,393.10.

A chemical analysis of the first-class ore, made by Prof. Schaeffer, of Cornell University, gives the following result:

	Percentage.
Silica.....	74.203
Sulphur.....	11.960
Iron.....	10.636
Lead.....	1.444
Copper.....	1.020
Alumina.....	.863
Silver.....	.056
Gold.....	.012
	100.244
Selenium.....	Trace.
Tellurium.....	Trace.

Hiko.—Good news comes from Hiko. Henry Raymond's mill started up on the 22d of last month, and has been running along ever since. When the stamps were first dropped the mill was not completed, but is now, with the exception of the roof, which will soon be completed. It was just about three months from the time that Henry Raymond first started shipping material for the construction of his mill till the first stamps fell. Considerable delay was caused in the transportation of material by the storms. The mill is a five-stamper, yet was constructed so five additional stamps could be added at any moment with but little trouble, and they are now preparing to put in place the additional stamps. This mill is situated in a canyon about 15 miles from Hiko, and the town site has recently been christened "Cassel City," in honor of Jack Cassel, the dashing Superintendent of the Green Monster mine. The mill has a supply of water sufficient to run a 20-stamp mill, which is furnished by a spring, and as the water is 18 ft. higher than the pans, it does away with the pumping of water altogether. The mine is situated one mile and a half from the mill, and the ore is all packed along the mountains on mules from the mine to the mill. The ore which is run through pulps from \$100 to \$150. The Green Monster mine is looking splendid, there being a large quantity of ore in sight. In the tunnel that was being run, a three-ft. vein was encountered, which is 90 ft. below the bottom of the shaft, and assays from \$150 to \$350 per ton. There are about 45 men employed at both mine and mill. W. M. Wilson says Henry Raymond will probably be in Pioche the last of the month with a load of bullion.—*Pioche Record*.

GOLD MINES NEAR BISHOP.—Quite a little excitement has occurred on Bishop creek over some gold ledges situated about 12 miles east of the town, in the west foot-hills of the Inyo range. One of the best is a three-ft. ledge belonging to Hypolite Galerón, from which, by means of a small aqueduct over the river, he last week cleaned up \$350 in gold after working five tons. The specimens all show gold in a free state, and the entire ledge would pay handsomely with proper milling facilities. Messrs. Keating & Baule, of Bodie, recently made an examination of the property, for which they offered \$10,000 and were refused. Extensions on this ledge, probably of equal value, belong to J. H. Stoutenborough and to Munzinger & Phillippy. Higher up on the mountain Gilbert, Sherman & Black have discovered some mines of the same description and equally rich in gold. The veins are contact, in slate and lime; small specimens of the ore may be seen at this office. It is to be hoped that the Bodie party may be encouraged to put up a mill.—*Inyo Independent*.

PYRAMID LAKE MINES.—Colonel F. F. Osbiston and Superintendent Smith, of the Belcher, who went out to Pyramid lake day before yesterday to take a look at the Jones and Kinkead and other mines in that vicinity, have returned. They brought home with them some samples of ore that present a fine appearance and assay well. It is one that can be very easily concentrated. It will be an easy matter to put six tons of it into one. This gives a ton of material rich enough to be sent almost any distance for further reduction.—*Virginia Enterprise*.

### Mining Altitudes.

Scientific men have proved by actual measurement that most of the great silver mines lie 10,000 ft. above the present sea level, and among the richest are some which lie 2,000 ft. higher still. Very rich mines have been found as high as 16,000 ft. It is a notable fact that as a rule the richest silver mines lie over 10,000 ft. above the sea level. The mines on Ruby Hill are between 8,000 and 9,000 ft. above the level of the sea.—*Ruby Hill Mining News*.

According to the above item Nevada is a notable exception to that 10,000 ft. rule, her richest mines, including those of Ruby Hill or Eureka mining district, lying considerably below that level. The *News* says that the general surface of the Comstock lode, which must be classed as among the most famous and richest of the silver mines of the world, is about 6,000 ft. above the level of the sea. The Sutro tunnel, which intersects the Comstock 1,600 ft. below the surface, is 4,400 ft. above the level of the sea. The rich bonanzas of the Crown Point and the Consolidated Virginia sections, which have yielded \$200,000,000, were nearly or quite down to the Sutro tunnel level. In point of fact, the deepest workings of the Comstock are less than 3,000 ft. above the sea level. There are no large bonanzas of ore found at that depth as yet, but there is no reason to believe that there will not be, extending perhaps far below the sea level.

NEVADA ASBESTOS.—Heretofore most of the asbestos used by the Asbestos Felting Company, of San Francisco, has been procured in Sierra and Plumas counties, California, but recently they have been obtaining the article from Elko. The asbestos shipped from Elko comes from a mine somewhere in that part of Nevada which is owned in part by Prof. W. F. Stewart. It is much superior to the California asbestos. The fiber is as soft and fine as cotton; indeed, a person not well acquainted with the mineral would at once pronounce a hunch of it to be raw cotton. J. W. Farrell, who is agent for this State for the felting company above-named, is now patching up the former coating of the Hale & Norcross boilers and steam pipes with this asbestos preparation. The good service done by the former coating at the time the works were destroyed shows the utility and excellence of the preparation. Mr. Farrell has coated all the boilers and steam pipes on the Comstock and in Bodie and other places with this asbestos felting. The big fire at the Hale & Norcross made very little impression on the asbestos covering of the boilers and pipes. It would doubtless have remained intact, but for the water thrown in upon it while it was hot. This caused some scaling off of the outer coat in a few places.—*Virginia Enterprise*.

WOMEN AND MINING.—There are many vocations at the present time which were, at one period in their history, almost exclusively monopolized by men, but are now being opened to admit woman, who has compelled recognition by her talent and ability. The ranks of the theologians and physicians show many women who well maintain the position they have sought and secured. Beyond a speculation in stocks, the business of mining has presented but few points of interest to the gentler sex. A case has recently come under the *Mining Review's* observation which is at least worthy of record. Mrs. B. C. Clark, by the death of her husband, came into possession of a number of mining claims, and in order to intelligently superintend their development, and to gain a knowledge of the science of mining, she has taken a course of study in Prof. Mardock's school of assaying and chemistry in Chicago. This lady has also studied the operations of machinery, smelters and crushers, and is thoroughly imbued with the spirit of mining. A woman, as a skilled writer on metallurgy and mining, or as a superintendent of mines, would be a new thing under the sun.—*Nevada Transcript*.

THE PROVIDENCE.—Judging by the satisfied look that owners of this reliable quartz mine wear they are "not losing money on their goods." The hurrying of their hoisting works last summer might have proved a considerable hindrance to less practical and energetic men, but did not to them. Before the ashes of the ruins scarcely had time to cool off they had a new and better building over the mouth of the 1200 ft. incline, and were sailing along as merrily as though they had never seen a fire on the claim outside of the furnaces where fires ought to be. Since then fortune has smiled continually on them. Over near the new shaft some big developments have been made. Tons and tons of the bonanza kind of rock has been coming out there for many weeks, and the deposit has evidently just been tapped. The big hoist-works over the new shaft, the erection of which has been delayed longer than was anticipated last summer, will be begun this month we understand, and before another winter comes the Providence will eclipse its former successful history.—*Nevada Transcript*.

THE RISING SUN mining company, whose mine is near Colfax, has just declared another quarterly dividend of 15 cents a share. The 10,000 shares of treasury stock, offered to the stockholders on January 25th, were all taken. The proceeds of this sale will be used to increase the facilities of the mine. The company still retains 85,000 shares of capital stock in their treasury.

MECHANICAL

PROGRESS.

Progress in Machinery.

One hundred years ago, when thread numbered 150 by the standard set up by spinners was considered the utmost degree of fineness possible by English spinners, a pound of cotton spun to such fineness would give a thread 74 miles in length, sufficient to reach from Boston to Concord, N. H. The machinery of to-day spins for useful purposes thread numbered 600—from one pound a thread 196 miles in length. And machinery has been constructed so delicate that a pound of cotton has given a thread reaching 1,061 miles—farther than from Boston to Chicago! The weaver of my boyhood could throw the shuttle perhaps 25 times a minute, but not at that rate through the day. Human muscle would break down under such rapid action. In 1850, Compton's loom threw the shuttle 50 times a minute, whereas so great has been the advance of invention, that the loom of to-day is considered a slow-moving mechanism if the shuttle does not fly 240 times a minute. "No man can afford to take as a gift to-day a cotton manufactory equipped with the machinery of 1850," was the remark of the late superintendent of the Amoskeag mills. "We are breaking up the machinery of those days for old iron."

In some departments of cotton manufacture, a man with the present machines will do eight times the amount of work which he could accomplish in 1860. In the manufacture of coarse cloth an operative with 10 machines does twice the work which he could accomplish with 13 machines before the war. There never was a period so fruitful in discovery, so fertile in invention as the present, and this reason is manifest. The first discoverers and inventors groped in the dark. They were ignorant of nature's laws. They did not know what force was. They had a limited comprehension of what the simple mechanical powers were. There was little accumulated wealth of research.

In contrast, the mechanic of to-day has all the discoveries, the experiments, the ascertained facts, mathematics of machinery, the laws of force at his command. He inherits the scientific wealth of all the past and makes it his capital. Instead of gazing, as it were, upon old mines worked out, he beholds mountain ranges filled with golden ore, and engages in his work with the stimulus of the needs of the human race, and the ever increasing wants of an advancing civilization.—*Sci. Am.*

Driving Nails by Machinery.

Nails are now driven by machinery in most box factories where sufficient system and repetition exist to make it profitable, one machine doing the work of 10 or 15 men. The general idea of these machines is as follows: The nails are fed by hand into bell-shaped holes in a revolving disk. These holes are arranged in radial lines, each line with as many holes as there are nails wanted along the side of a box. This disk revolves and delivers the nails into bent tubes, each nail to a separate tube, which delivers it to a kind of a pair of nippers arranged in a row with others. Upon receiving their nails, the nippers advance simultaneously, so as to bring each nail under a kind of stationary hammer, the point of the nail protruding below the embrace of the nippers. At this point in the operation, the box upon a sliding platform rises until the points of the nails penetrate it to a certain extent, when the nippers relax their hold and recede, the box still rising to receive the entire penetration of the released nails the stationary hammer acting upon the heads of them meantime. This nails one edge of the box; but all the edges having the same arrangement of nails are finished by a repetition of the above movements. Then, to do the ends, the boxes are transferred to other machines, or the same one can be re-adjusted when a sufficient number of boxes have been passed. These machines work with rapidity and precision, and not one nail in many thousands fails to enter properly. Self-feeding nail machines are beginning to occupy the attention of inventors with some degree of success.

CASTINGS.—Castings seem to take to themselves peculiar freaks of irregularities, the causes being difficult to define. They occur sometimes in the sand, sometimes in ramming, sometimes in venting, and often with wrong facings. For instance, the quality of facing sand must always be graded, according to the casting to be made heavy or light, deep or shallow in the mold. Again, inferior coal in facings sands is detrimental. Possibly the dealer in foundry facings has been grinding inferior stock, instead of getting a carbon in the form of coal dust to stand the iron pouring against the mold. There has been dirt and slate ground in with the coal. This is a cause of scabby castings, together with too fine a sand or a sand without body, which all molders dread except for very light work. If molders could only have good sands, good irons, and good facings, and the same stock supplied each time, there would be little need of complaint; but the geology of our country is not such as to admit of digging molding sand at every foundry back door, when molding sand costs from \$40 to \$50 a car delivered in a foundry yard, as we know it does in many instances.—*Amer. Machinist.*

Welding by Electricity.

SCIENTIFIC

PROGRESS.

It is well known that great strength, with proportionally light weight, may be obtained in wrought-iron structures by employing the tubular form of making up. The great Victoria bridge, the Menai Straits bridge, the hull of the *Great Eastern*, and many other modern constructions of wrought iron are cases in point. But the cellular structure also has its advantages. The comb of the honey bee has been often quoted as a specimen of the utilization of space. It is fully as instructive as an illustration of the judicious employment of material for strength. It will appear reasonable to suppose that a rectangular sectioned beam of wrought iron would be much stronger if its interior was a series of transverse braces formed of sections of a circular or angular form, and making a part of the structure itself. The difficulty in the way of such an achievement is the impossibility of forming these transverse braces and the longitudinal plates into a solid and homogeneous whole. Claim has recently been made by a bright mechanic, that he can, by electrical action, really weld iron in place, and he exhibits a piece of his handiwork that appears to be perfectly welded, and done, as he says, by the heat of electricity. He says that he has filled a rectangular beam of wrought-iron plate with short sections of wrought-iron pipe, placed side by side, or at distances apart, but at their ends meeting the top and bottom plates of the beam, and welding them *in situ* so that they form a honey-combed structure making a homogeneous beam. He insists that this welding is done by means of dynamic electricity, inducing a welding heat on the inner surfaces of the longitudinal plates and the ends of the engaging tubes. The claim, at present, rests solely on the inventor's statement and his exhibit of a small specimen, not large enough to give a practical value to his reputed discovery. If his sanguine claim could be made a practical possibility, its value in increasing the usefulness of iron in permanent structures would be immense, and his discovery would greatly modify some of the present methods of working fibrous iron.—*Design and Work.*

The Locomotive a Precedent for Higher Piston Speed.

Advocates of high piston speed, just now attracting some discussion and exchange of opinions, have a strong argument on their side in the locomotive as built and operated to-day. Certainly no more prominent instance could be cited in favor of the system. Here is a machine that depends upon high speeds of piston for its success, and is worked under more adverse and destructive conditions than a stationary engine is ever liable to, yet it undergoes no extraordinary wear and tear, while exerting greater power in the same space of time than the stationary engine. As regards mechanical construction, the locomotive engine displays the most advanced knowledge of the day, in the fitting up of parts, in proportion of wearing and bearing surfaces, and in working steam expansively, as far as the link motion is capable, while in mere endurance of shock and strain of varying loads, handled by different persons of more or less mechanical knowledge, it suffers more in a year than a stationary engine in a lifetime.

No other tools than those already in daily use are required; no mechanics other than those already trained, need training, so that if we are to build high speed stationary engines instead of low speed, the necessary appliances and precedents exist. In connection with this subject, and as a practical example of the truth of the statements above, engine 273 on the Pennsylvania railway may be cited. This engine was built in 1875, has 5-ft. drivers, and weighs about 38 tons. It has never been repaired until recently, two months ago, and in 49 months' continual use has made a mileage of 251,552. This is only one instance, but doubtless many more could be cited in favor of the practicability of economical high piston speed.—*Exchange.*

NEW METHOD OF GENERATING STEAM.—A French manufacturing firm, Messrs. Serpollet, have patented a peculiar method of generating steam. At each stroke of the piston of the engine a certain quantity of water is projected against two strongly-heated metal plates. The steam so produced goes direct into the cylinder, so that in this arrangement not only a special generator, but also the valve system for the entering steam, is superfluous. The mode of action is similar to Hock's petroleum motor. In the example given in *Dingler's Journal*, the vaporizing surface consists of two metallic cooes, one within the other, with an interval of about 0.04 inch between. The hollow space is divided into two chambers, each of which is connected with one side of the cylinder. The gases play first on the inner surface of the double cone, then on the outer.

MALLEABLE IRON is said by Forguignon to lie intermediate between steel and gray pig iron, differing from the latter by the special nature of its amorphous graphite and its greater tenacity, and from steel by its small elongations and large proportion of graphite.

RUBBER WHEELBARROW tires were first invented in England to prevent the noise of wheelbarrows in warehouses, railroad stations, etc. To accomplish this object a rim of vulcanized rubber is fastened around the tire of the wheelbarrow.

Unrecognized Qualities in Charcoal.

Among the numerous and varied properties possessed by charcoal, there is one—one, too, of the most wonderful—which does not seem to be adequately recognized, probably from its being imperfectly known except to physicists. It is that of being able to condense and store away in its pores many times its own bulk of certain gaseous bodies, which it retains, thus compressed in an otherwise unaltered condition, and from which they can be withdrawn, as required, as from a reservoir.

That eminent scientist, M. Saussure, undertook the task of a systematic examination of this subject, with a result which will prove surprising to the general reader. Operating with blocks of fine hoxwood charcoal, freshly burnt, he found that by simply placing such blocks in contact with certain gases they absorbed them in the following proportions:

	Volumes.
Ammonia.....	90
Hydrochloric acid gas.....	85
Sulphurous acid.....	85
Sulphuretted hydrogen.....	55
Nitrous oxide (laughing gas).....	40
Carbonic acid.....	35
Carbonic oxide.....	9.42
Oxygen.....	9.25
Nitrogen.....	6.50
Carburetted hydrogen.....	5
Hydrogen.....	1.75

It is this enormous absorptive power that renders of so much value a comparatively slight sprinkling of charcoal over dead animal matter as a preventive of the escape of the odors arising from decomposition. A dead dog having been placed in a box in the warm laboratory of an eminent chemist, and covered with charcoal to the depth of between two and three inches, could not be discovered to have emitted any smell during several months, after which time an examination showed that nothing of the animal remained but the bones and a small portion of the skin. To the large excess of oxygen over the nitrogen in the atmosphere, which, according to the above table, was absorbed by the charcoal, and which thus rendered harmless the noxious vapors given off by the carcass as they were being absorbed, is doubtless owing the fact above stated and the further fact of the charcoal never becoming saturated.

A reader of the *Scientific American*, who has been trying certain experiments on the value of charcoal as a convenient means of storing oxygen, reports favorably as to the results. In a box or case containing one cubic foot of charcoal, may be stored, without mechanical compression, a little over nine cubic ft. of oxygen, representing a mechanical pressure of 126 lbs. on the square inch. From the store thus preserved, the oxygen can be drawn by a small hand pump.

From the fact of the charcoal absorbing oxygen in so much greater proportion than nitrogen, we have here a means of utilizing its discriminative powers of selection in obtaining unlimited supplies of oxygen from the atmosphere, which contains nitrogen five times in excess of its oxygen, or 20%; whereas, by the separating or selective powers of the charcoal, the mixed gases capable of being extracted from it contain over 60% of oxygen. It only suffices to withdraw this now highly oxygenized air into another vessel of charcoal, by the further exposure to which the proportion of oxygen will be increased to a still greater extent. This indicates a most feasible means by which atmospheric air can be decomposed in such a way as to provide a cheap supply of oxygen.

One cannot readily recognize the fact, which is nevertheless true, that the condensing power of charcoal, as applied to ammonia, is equal to what would be obtained by subjecting this gas to a pressure of nearly 1,260 lbs. on the square inch.—*Illustrated Scientific News.*

A POWERFUL LIGHT.—The Brush Electrical Manufacturing Company at Cleveland, Ohio, has recently manufactured for use in the British navy an electric light, which has been tested and found to have a 100,000-candle illuminating power—a power 50 times greater than the ordinary electric lamp for street lighting. This is believed to be the largest and most powerful light ever made with human hands. It is designed to be used in night attacks, and to surmount the sea for torpedoes. A 40-horse power engine is required to produce the light. The carbons used are two inches and a half thick. The intense heat generated between the carbon points is half a million degrees, one-ninetieth the estimated heat of the sun. It is calculated that with an ordinary reflector a beam of light will be cast so powerful that a person 15 miles away can see to read by it.

AN ELECTRICAL ELEVATOR.—Dr. Siemens, who appears to be indefatigable in seeking to extend the sphere of usefulness of electricity, has brought out an electric elevator, which he has been exhibiting at Mannheim, Germany. Its construction appears to be simple, and suggests an easy method of putting in safety brakes. The cage is carried by wire ropes, having counter-weights, so that the cage, when loaded, is practically in equilibrium. The current generator at the base is electrically connected to the dynamo-machine in the cage, and the latter actuates two toothed wheels, taking into a metal rack running up the center of the passageway of the lift.

Perazotic Acid.

SCIENTIFIC

PROGRESS.

The discovery of a new compound of oxygen and nitrogen has been announced by MM. Hautefeuille and Chapuis. It contains more oxygen than azotic acid, and has been named by the French chemists perazotic acid. It is well known that on passing an electric current through oxygen a portion of the oxygen is transformed into ozone. If the ozone be mixed with nitrogen, the spectrum indicates the presence of a body characterized by black bands. The bands disappear when the gaseous compound is mixed with water, and the latter is acidified. The application of red heat to the gaseous mixture also causes the black bands to disappear. The experimenters are now endeavoring to isolate the new acid in order to study its properties. M. Berthelot some time since suspected the existence of the body in question during some experiments which he has not published. Its presence was indicated to him, however, merely by phenomena of coloration which appeared and disappeared during the passage of an electric current through a mixture of oxygen and hypoazotic acid. His observations were communicated to Messrs. Hautefeuille and Chapuis, who, by obtaining the spectrum, have placed the existence of the new acid beyond doubt. The discovery is the more surprising, as oxygen and nitrogen, being constituents of the atmosphere, have so long been the objects of what might have been considered exhaustive study.—*Design and Work.*

USES OF CHEMISTRY.—Let us give chemistry its true place. It has led the world's progress for half a century, and it will lead it with still more rapid strides during the next half century. It has preceded the practical man, lantern in hand, along all the untrodden paths of invention and discovery. It has become to every progressive industry what a cane is to the blind man. It does not follow, however, that we can depend upon it alone, nor that we can rely on every analysis handed us. Because the blind man finds a cane helpful, no one with unimpaired vision would be wise in shutting his eyes and walking with the aid of a cane. Still less would the blind man be wise to throw his cane away because it sometimes fails to detect an obstruction in his path. We have a right to distrust an analysis when it points to conclusions which cannot be safely accepted unproven, but the man who looks to the chemist for all the information which an intelligent study of the composition of matter can give him, will know more and act more wisely than the man who depends upon his practical knowledge or his general intelligence. When we are willing to pay for care, skill and experience in laboratory work, and the profession offers a career for ambitious young men who are driven from it by the lack of promising opportunities in this field, the general standing of chemical work will be raised, and there will be a longer list of names which, appended to analyses, will command confidence. Meanwhile, no one who spends money judiciously in learning all that the chemist can tell him will waste it, while the owner or manager of works who feels that he can dispense with the chemist's services, will make a mistake.—*Iron Age.*

SCIENTIFIC PROGRESS.—The recognized and frequently applauded tendency of modern investigation in natural sciences, has been toward an accumulation of facts, rather than toward any effort to generalize from them. As a reaction against the mania of speculation prevailing in the earlier stages of the development of modern chemistry, geology, etc., the direction taken has produced highly salutary results. The foundations thus laid have been broad and substantial, and the haze of doubt and uncertainty has been swept away in many departments of science, while new fields of research are constantly opening to a large number of intelligent and active workers. No one will be inclined to underrate the value of their labors, and yet it is difficult to escape the feeling that, notably in chemistry, this search for new facts is conducted without the proper discrimination. A mass of data is piled up without order or connection. It would be valuable material in the hands of those skilled in grouping and arranging it in such a manner as to secure a basis for further work. In its present shape, however, it is only raw material, and while a great deal of credit properly attaches to original investigation, it should be remembered that it is as great a thing to make a fact useful as to find it out.—*The Iron Age.*

AN ALUMINUM BATTERY.—Liebig's *Annalen* describes a novel and curious voltaic cell, which has recently been devised by Herr Wohler. The chief peculiarity is that both plates are of the same metal—aluminum—and a tolerably strong current is supplied. The cell consists of a glass vessel six inches high, filled with very dilute hydrochloric acid, or caustic soda, and containing an inner porous pot filled with concentrated nitric acid. In each compartment is placed a cylinder of aluminum provided with a projecting lug which passes through the cover of the vessel, and acts as a contact piece for the electrodes or conducting wires. As soon as the aluminum cylinders are plunged into the acids, a current is given off sufficiently powerful to heat a platinum wire red hot.

NUMBER OF PLANT SPECIES.—The total number of plant species existing on the globe, according to recent calculations made by Dr. Muller, of Geneva, is 250,000.

with free gold and black sulphurets. The location is most admirably situated, and surrounded with abundance of wood and water and a good road within 300 yards of the vein.

**DAY PLACER.**—We were shown a few days ago, by County Treasurer Thorne, 3 buttons of placer gold, valued at \$140, the result of a clean-up made by Mr. Sam Stoby, from his claims near the Toll House. These claims have been worked more or less every winter for many years, and still continue to yield gold in paying quantities whenever there is water to be had to work them.

#### KERN.

**STAKE.**—Kern County Californian, Mar. 12: A rich strike is reported in the Big Blue mine at Kernville. The company have been working in fairly remunerative rock hitherto, but lately they have struck the old west vein which was formerly worked with such good results, but which was lost several years ago. They have sent to San Francisco for a gang of miners, and will prosecute operations on a larger scale.

#### LOS ANGELES.

**LOOKING UP.**—Cor. Los Angeles Express, Mar. 12: Mining interests are looking up in this section after being long dormant. Some 25 men are at work on the Baldy bridge mine, near Ravenna, and many quartz ledges are being located. A lead that will yield \$100 per ton in this county is worth more than one that will yield \$150 per ton in Arizona. In the northern part of this county, near the head of Casteca canyon, there is a region that has been little prospected for mineral until recently. Several leads in this locality show very flattering prospects of mineral wealth.

**OIL.**—Developments in the oil region are showing a most satisfactory result, and the wells are producing better than ever before. Two new wells are now being bored, and a 10,000-barrel tank is to be erected at Now-hall immediately. One hundred barrels per day flow through 7 miles of pipe to the refinery, and thence most of it is shipped to the large refinery at Alameda, in its crude condition. About 30 men are now employed, and the demand for oil is rapidly increasing.

#### MARIPOSA.

**HOLSTROM.**—Cor. Mariposa Gazette, Mar. 12: Everything is at a standstill in this section. The No. 9 mill and mine has been shut down, and the little rattle-trap at Pool's is doing nothing. The ore taken out by the present company is as good if not better than any previously taken from the mine. Mr. Holting, the present owner, had an average assay made in San Francisco before he purchased the mine, and it went as high as \$9 per ton. But under the present process of running it through, and their new idea of amalgamating, it only worked (at this time) at \$1 per ton. The fact of amalgam being found 300 to 400 yards down the gulch below the mill is conclusive evidence that the present mode of working will not do. The Washington is still doing well. They are working the usual number of hands, and I saw some fine ore lately taken from the 1100 level of that mine. Messrs. John Bell & Co. propose to soon put up a 100-stamp mill on the Merced river for the purpose of working the rock from the Quartz Mountain vein situated about 1 mile west of Givens' ranch, and also for the purpose of crushing custom rock. They say that they can crush rock for \$1 per ton, and also transport rock from the Quartz Mountain mine at 50 cents per ton. They propose to build a narrow-gauge railroad from the mine to the mill.

#### NEVADA.

**MINING ON THE RIDGE.**—San Juan Times, Mar. 12: It is a very difficult matter to learn from the miners on the Ridge the amount of gold dust realized at each clean-up of their respective mines. We know enough, however, to say in confidence that the mines from French Corral to and including Moore's Flat, are paying well, and that the companies are well satisfied. The following are the mines of note in this township: worked by hydraulic, they are as follows: The Milton mine, at French Corral; the Manzanita mine, at Sweetland; the American, near this place; Bowen & King's mine, on San Juan hill; and the English mine, at Badger Hill. The Milton mine and the Manzanita mine belong to the same owners. They each utilize daily about 1,000 inches of water. The American company utilizes about 300 inches of water, and run about 100 stamps. Bowen & King utilize 60 inches of water and night. Bowen & King utilize 60 inches of water and night. The Badger Hill company have their own water in the winter season. In the summer season they obtain their supply from the Eureka Lake company. The Lone Ridge company expect to be able to commence washing about the 1st of April. They will utilize about 500 inches of water daily, and will obtain it from the Milton company. Only two of the companies named are corporations, to wit: The Milton and Manzanita; the others named are joint stock. George D. McLean and others are busily engaged in running a bedrock tunnel to drain their mining ground at Empire Flat, near French Corral. When this tunnel is completed, it will open up the richest mining ground in this township. In Bloomfield township there are but few companies at work worth mentioning. These are the mines of the Eureka Lake company at Columbia Hill, and the Malakoff company, near North Bloomfield. In Eureka township there are several noted mines in full blast, mostly at Moore's Flat. The best paying mine in that township belongs to the Eureka Lake company, though it is reported here that Mr. Blackwell's mine, at Snow Point, is turning out to be a bonanza. R. McMurray is the local Superintendent of the Eureka Lake company's entire works on this ridge. H. C. Perkins, of Malakoff, is the General Superintendent of the entire works of the Milton gold mining company on the ridge, from French Corral to North Bloomfield. At the death of V. O. Bell, Mr. Perkins was selected to fill the place of deceased. Under these Superintendents are foremen. Everything is conducted on systematized principles, every employee having his place, and knowing just what to do. Mining on this ridge is but yet in its infancy, so to speak, for there are thousands of acres of the best mining ground not yet opened up.

**PEARL CON.**—Transcript, Mar. 13: Another shift has been put on at the Pearl Con. claim, on the South Yuba below Kirkham's, and the tunnel will hereafter be run at the rate of 4 or 5 ft a week. The rock continues extremely hard, and some good-looking stringers have been encountered, and the stockholders are anxious to complain at the prospects. Probably within 2 months the main ledge will have been reached and sufficiently prospected to give a pretty fair idea of the value of the property.

**TUR BANNER MINE.**—The incline of the Banner mine is now down 200 ft. A depth of 800 ft will have been reached by April 1st. The character of the ground being well adapted to sinking. At this point the ledge, which now shows over 6 ft of favorable vein matter, will be reached on both north and south. It is anticipated that the very rich pay chute worked to a slight extent by the old Banner company, will be encountered to the south of the incline. As soon as the roads are in a proper condition for crushing the ore now coming from the incline will be hauled to the mill and there crushed. It is expected that the main ledge will be reached and sufficiently prospected to give a pretty fair idea of the value of the property. To be opened again.—The Gold Hill News says of the Centennial gravel gold mining company, which is composed of citizens of Gold Hill and Virginia City, and whose claim is situated in Washington township, Nevada county: They have spent over \$20,000 endeavoring to reach the main ledge, and it passes through their extensive ground—over 300 acres—and at last that they have all the time been drifting and working in the wrong direction entirely. Recent rich gravel developments made in the ground immediately adjoining have proven this theory and shown the proper direction to work, so that now all they have to do is to go in and win. They are making active preparations to do, and have every reason to think they will develop a good paying mine before the end of the present season. Mr. Henry Balch, a member of the company, is Superintendent, and is in charge of the mine. He has been instructed to put on a force of men and actively push the development of the mine to the best advantage possible. Mr. Balch is an old California miner, and was foreman of the Crown Point for some years during its most successful working. He is a

first-class manager, and the company feel that at last they have the man they have long needed, and in the right place. If he commences work in the right place, drifts in the right direction, and hits the big gravel lead in the right place, everything will be all right, especially if he finds plenty of gold.

**MINING LOCALITY LOOKING UP.**—Nevada City Herald, Mar. 10: The locality bounded by the Mt. Auburn mine, Rush creek and the South Yuba, northwest of this city, there are quite a number of prospectors, who all seem confident that they are in a good mining district, notwithstanding that the vicinity previously has had, in mining parlance, a "black eye." Indications at present are that quite a number of cool mines are being prospected, and the coming season will see many prospectors roaming the hills, seeking desirable locations, the advance guard already having gone out. Eastern capitalists have begun to cast their eyes over this range, and rumors are rife that so well pleased were they that several sales are in negotiation. We predict for the future, new life and activity for this heretofore comparatively neglected district.

**THE ADOR MINE.**—This mine, owned by Messrs. John Curry and John Maglia, situated on Miller's ranch, about 3 miles northwest of town, is being developed into a claim of value. A tunnel 150 ft in length was run, and rock encountered that prospects well in free gold. As soon as the roads permit, the owners propose to commence the hauling of milling rock to this city.

**A MISSED SALE.**—The Yellow Diamond mine, in Rocky ravine, about 8 miles northwest of this city, owned by Messrs. Jamieson & Locklin, is about to be sold to New York capitalists. This mine is considered to be a valuable piece of property, and is situated within a short distance of John Curry's ledge, that attracted considerable public attention a short time ago.

**EAST NEW YORK MINE.**—Placer Times, Mar. 12: Monday, March 12, Dr. Nathan and G. B. Chadwick, partners in the ownership of the East New York mine, located on Steep hollow, Nevada county, about 5 miles distant from Dutch Flat, called at the Times office and showed us \$338, the result of 50 carloads of ground taken from the mine while running gangways from the main tunnel, which is run in bedrock with a strip of gravel on the top of from 6 inches to 1 ft in depth. The main tunnel is in 2,200 ft, from which the gangways are being run. This gangway, from which the gold shown up was taken, had been run 100 ft, with a strip of gravel on an average of 1 ft thick and 2 wide. So far, nothing has been done in this mine with the view of taking out gold, only what has been cleaned up from running the tunnel and gangways—a system being laid out for properly opening up the whole claim before any breasting was commenced. Mr. Trathen informs us that in about 6 weeks they will reach the line of the system, and then the work will be done in a gangway, when breasting will be commenced at that line for the purpose of taking out the gold; but only a small space will be taken out, as it is proposed to cut the main tunnel through to the back line of the claim before much work is done, so that breasting can be commenced at the back line and systematically carried forward down the tunnel. In all the different gangways run, the prospects are fine, and it is estimated that at least \$100,000 is now in sight and can be taken out, already opened up for working.

#### PLACER.

**HIERNIA QUARTZ MINE.**—Placer Times, Mar. 10: Sunday, Mr. John McNichols, owner of the Hiernia quartz mine, on the edge of the Swamp Angel, was in town, and from him we learn that he is at work prospecting this claim, and that he has a large body of gravel on the claim is of the usual size, 600 by 1,500 ft, and on the same ledge or ledge upon which the Poole claim is located, on the opposite side of American river. This vein of quartz can be easily traced for miles, commencing on the south side of North Fork of American river and extending across on this side out past the C. P. R. K. He will open up the ledge this summer and make preparations for working it systematically. It is of the same formation and extension of the Poole ledge, and free gold can be easily seen by the naked eye from pieces broken from the rockings on the surface of the ground. The Poole mine has proved itself good, as the little rock that has been crushed has paid all the outlay the company ever have made in developing the ledge.

**BIO BLAST.**—Placer Times, Mar. 10: Last week a blast from the Bio Blast of black powder was fired off in the Brown mine, at Von Bet. A large bank was loosened up by the explosion. Hydraulic washing will be carried on on a large scale in this claim the present season. This mine is a very rich one in gold and a large quantity will be taken out this summer.

**SHADY OLIVE MINE.**—Friday we paid a visit to A. Larson's mine, the Shady Glen, adjoining the town of Alta, and made a thorough inspection of the ground and tunnel now run in the mine. Mr. Larson has a tunnel run into the gravel on the bedrock a distance of 1,100 ft, commencing in the bedrock on the bank of Canyon creek. After a short distance through a rim of bedrock the main gravel formation is met, through which the entire length of the tunnel is cut. This gravel is not cemented and could all be picked without blasting. The gravel is all the finest kind for hydraulic washing, being all quartz gravel without any large boulders. The bank of the tunnel are so soft that the gravel could be picked loose by the hand, but solid enough to stand well without danger of caving. Fine prospects have been made all along the tunnel and some fine specimens of gold been taken out. Mr. Larson will run in still further, as he has not yet reached the main gravel channel, but expects to within a few more hundred feet.

**THE TURKISH SUN MINE.**—Placer Herald, Mar. 12: As soon as the main shaft can be repaired sinking the shaft will be begun and its depth increased about 800 ft, making it 1,200 ft deep. When a depth of 1,200 ft in the shaft is reached drifting will be commenced and the lower part of the mine developed as thoroughly and rapidly as practicable. In a few months from now this mine will be deeper than any other in this part of the State, and its output will be most extensive. Work will be done in the western portion as soon as the drifts can be retimbered, in order to render it safe to work in them. This part of the mine has been unworked for some time, and for several hundred ft down the ground has not been broken. While the main shaft is being repaired the foundation of the mill building will also be repaired, and everything put in first-class order for the inauguration of a new and more extensive mining operation. The mine will accommodate about 50 men will be built on the flat near the mine by the company as soon as arrangements for its construction can be made. About 70 men are now employed by the company, and when all the improvements and developments intended to be made are fully begun, the number will be increased to about 100 men.

**MICHAEL BLANK.**—Cor. Placer Times, Mar. 12: The quartz mine has seized every person in this section. It is quartz for breakfast, quartz for dinner, quartz for supper, and if the excitement still continues, it will be quartz for a tonic, instead of rock and rye. The Daniel Webster mine, a quartz ledge recently discovered, about 11 miles from town, is reported to be very rich. I believe it is the intention of the owners to convey the quartz to the Turkey Hill mill to be crushed.

#### PLUMAS.

**PLUMAS NATIONAL.**—Crescentville Bulletin, Mar. 10: The last reports state that work is progressing steadily, both at the mill and the chlorination works, to the satisfaction of all concerned.

**SOUTHERN EUREKA CON.**—This is in readiness for active work, and the new mill is to be started to-day. Everything is favorable for a steady and uninterrupted run of the stamps.

**GREEN MOUNTAIN.**—The stamps are running uninterruptedly, and the usual activity is manifest in all the details of this well-conducted property.

**ANTELOPE.**—This company has struck a ledge in its tunnel. At last account the shaft had run 5 ft through it and had not reached the foot wall.

**INDIAN VALLEY.**—Last Wednesday evening the tunnel reached the shaft, encountering a large body of very rich ore. Active work is now in progress retimbering the tunnel, laying the track and arranging for the transportation of the ore from the shaft through the tunnel to the mill,

which is ready to start up as soon as ore can be brought to it. The tunnel strikes the shaft 40 ft below the top, and 800 ft above the bottom, and will be able to supply the mill for a long time to come.

**RICH STRIKE.**—Plumas National, Mar. 12: The Southern Eureka M. Co., near Cherokee, struck a ledge a few days ago, 5 ft in width and prospecting splendidly. Indications of a ledge are visible at some distance from the mine, and the efforts which have been made to reach it through the present workings have just succeeded. They start their mill up to-morrow on the new ore, with every indication of success.

**THE JAMISON SHAFT.**—Mr. Thos. W. Jenkin, Sec'y of the City Enterprise M. Co., says that work has just been started up on the shaft again, and this boys think that they will be able to find bottom this time. They are down about 200 ft, and have sent a little over \$40,000 in cash to do that much. The shaft is a large one, 9x14 in size of timbers, and the water is kept down by two pumps, one 10-inch and the other 10-inch, both run by a large overshot wheel. The company is composed of working men, most of them being in the employ of the Plumas Eureka Co.

#### SANTA BARBARA.

**BEACH MINING.**—Gundulone Telegraph, Mar. 10: Mr. Abernethy, Sr., and Wm. St. Ores, went down to their gold mining claim on the beach, last Sunday, but owing to the recent heavy storms at sea, together with the flood tides, they could only work a few hours, but cradled out \$37 in fine dust.

**SABO-NORRIST.**—Redding Independent, Mar. 10: Although the cold of the 9th has departed, Sabasta county still contains a few lumps. This time Thomas Harrison, owner of a placer mine at Quartz hill, is the lucky man. While panning one day last week, he uncovered a chunk valued at about \$200.

#### NEVADA.

##### WASHOE DISTRICT.

**CALEDONIA.**—Cold Hill News, Mar. 14: Pumps have been run an average of 15 hours per day, burning an average of 6.27 cords of wood per day; pumping about \$3 inches for Belcher company. At Forman shaft have extended Suro tunnel drifts 6 ft and dropped it for the present; total length, 122 ft. Have put in plunger pump and balance-bobs at 1700 station; also 600 ft of compressed air pipe.

**SIERRA NEVADA.**—The northwest drift from the south slopes in the ore body (2500 level) is 40 ft in length. Amount of ore raised during the week, 8101 tons.

**CON. VIRGINIA.**—During the past week 310 tons of ore, assaying \$36.65, were extracted on the 1650 level and sent to the mills.

**OVERMAN.**—North drift, 2275 level, has been extended 50 ft; total length 106 ft. At the Forman shaft have put in pump and balance-bobs at 1700 station, and 600 ft of compressed air pipe, and will start pumps to-night and resume sinking to-morrow.

**HALE & NORRIST.**—The compressor and blower pipes are being taken out from the 1st to the 8th station, and new pipes will be put in place by the 13th inst., and work under ground resumed.

**ALTA.**—During the past week have sunk and timbered the shaft 35 ft; total depth, 1,925 ft.

**SILVER HILL.**—Everything is so far advanced that we will not be obliged to crowd anything to be ready to open the corresponding level as soon as Alta taps the water on their 2050 level.

**BELCHER.**—Pump running at 61 strokes is bolding the water below the 2160 level. All machinery is in good order.

**CALIFORNIA.**—During the past week 310 tons of ore, of the assay value of \$40.05 per ton, were extracted from the 1050 level.

**UTAH.**—During the past week the east drift on the 2150 level has been advanced 21 ft. The main incline has been sunk and timbered 15 ft.

**C. & C. SHAFT.**—The shaft has been sunk 6 ft during the week; total depth below the 2500 level, 24 ft.

**G. & C. B. & D. SHAFT.**—Making good headway with bolts No. 3 and No. 5 is completed. The bolts for 5 stations have been received from the foundry.

**UNION CON.**—On the 2500 level the joint Mexican east crosscut has been extended 27 ft, and we are cutting out a chamber for a winze in the joint Sierra Nevada east crosscut.

**UNION SHAFT.**—The shaft is being repaired at the 1000, 2200 and 2500 stations.

#### CANDELARIA DISTRICT.

**NORTHERN BELLE.**—True Effusion, Mar. 12: Since last week a crosscut has been started in a northwesterly direction from the main drift of the 4th level, which has been extended 15 ft, and is now in favorable looking ground. Other shaft levels show no material changes, but look as well as a week ago. The ledge above the adit are looking well throughout, keeping up their usual yield, and promising finely for the future. An average output of 88 tons of ore is being extracted daily and sent to the mills. The shipments of bullion on the March account up to the 9th inst., aggregate \$24,246.80.

**MOUNT DIABLO.**—The winze from the 2d level is nearly connected with the upraise from the 3d, and has been driven 12 ft. The ledge above the level is still following a ledge of fine-grade black ore and has been worked 14 ft. A winze has been started from the foot of the Callison winze on the 2d level, and is being driven toward the 3d.

#### ESMERALDA DISTRICT.

**FAVORABLE INDICATIONS.**—Esmeralda Herald, Mar. 12: I. E. James, Supt. of the Sierra Nevada mine, and one of the most thorough miners of the Pacific coast, spent Thursday examining mines in our district. He informed a Herald representative that so far as he could judge from his hurried examination, Aurora had the most favorable indications for large and rich bodies of ore of any camp on the coast, and it was his firm belief that as soon as the C. & C. R. reached Hawthorne, men of capital would come in. With a mill to crush even what was in sight, a few months would witness the shipment of large quantities of bullion.

**THE NEW ESMERALDA CON. CO.** are pushing the work of prospecting as rapidly as possible, and they say the more work they do the more they think of their property.

**EVA CON.**—The contractors on this mine are storing away the dump a large amount of ore.

**THE DEL MONTE.**—For the past two weeks the water has so bothered the superintendent and machinery, that nothing has been done in the mine save pumping and tanking. The new Esmeralda Con. Co. are pushing the work of prospecting as rapidly as possible, and they say the more work they do the more they think of their property.

**HUMBOLDT WEST.**—The Humboldt West ledge looks very promising, and the ore is a little different from anything in this camp. From wall to wall the rock is the same, some of it very high grade ore, while the whole vein will pay a very high price for milling.

**GRANTSVILLE DISTRICT.**—Alexander, Grantsville Bonanza, Mar. 10: The Alexander mine still opens better and better with every shot, and in the great stopes can be seen ore enough to run many stamps indefinitely. A large body of improved pattern arrived last night for the hoisting works. The incline is still being pushed rapidly downward, showing as well as ever.

**BROOKLYN.**—The Brooklyn shows no signs of letting up, but continues to furnish high-grade ore for 20 stamps, the stopes still showing up splendidly. The incline goes

down at a rapid rate, and soon another level will be ready for prospecting and stoping.

**DOWNEYVILLE.**—The new shaft of this Downeyville company is down 40 ft, and is being pushed as rapidly as possible. Heavier hoisting machinery has been ordered, and there will be no lack of capital to send things along at a lively rate. When the Carson & Colorado railroad is completed to Hawthorn, Downeyville will be within 40 miles of that place.

#### TYBO DISTRICT.

**SALZ.**—Cor. Eureka Sentinel, Mar. 13: It is rumored here that Mr. English has sold the Tybo Co. company's property to Eastern capitalists. If this be true, I hope the new company may give as entire satisfaction as the former owners. The property is second to none in the State, if the Richmond and Eureka Co. companies be excepted, and when the Two C mine attains the depth of the mines belonging to the above-mentioned companies, it will compete favorably with them for the laurels of being the gem of the Pacific coast.

There are a number of other promising claims in this district, among which are the Pace & Dunt, the Bod rock, with a 3-ft ledge of calena, the Luce & Dimick and the Independence, which has a well-defined ledge of high-grade ore.

Reports come from Florence district that the mines are looking well. All they desire now is to have a mill erected in the immediate vicinity to work their ore. Downeyville has been very dull here since the Tybo Con. closed down their works.

#### ARIZONA.

**SILVER BELLE.**—Arizona Mining Journal, Mar. 12: The unanimity of sentiment disclosed with reference to the new Silver Bell district is very encouraging. Now that Tombstone has been segregated from Pima county, it is of importance that our city should have some district to take its place as an ore producing center. The Silver Bell we have all the requisites. Ore has been found of the same character, surpassingly rich in metals, easily worked, advantageously located, and within a short distance of the railroad. Indeed, the similarities between the Tombstone district and the new bonanza are so striking as to demand special notice.

Just as Bisbee complements the silver workings of the Tombstone district, so do the wonderful copper ores in the vicinity of Picher supplement the splendid silver prospects in the Silver Bell.

**COAL.**—Cor. Tucson Citizen, Mar. 12: On a trip in the interest of the projected A. M. B. R. R., along its proposed route, I visited the immense coal field south of Oila river, and found it has already been traced from 20 to 30 miles in length and some 3 or 4 in width, though the same surface indications extend for very much more, and will doubtless be 10 miles wide. Veins show from 5 ft to 100 ft thick, and the coal increases in quality on going down, and from present developments the veins are but a short distance from each other.

**SILVER DISTRICT.**—Cor. Tombstone Expositor, Mar. 11: Thomas Hughes has sold his group, consisting of the Black Rock, Pacific and Blue Rock mines, for \$175,000; \$1,400 cash, the remainder to be paid April 1, 1881. Franklin J. Clark, of Tombstone, represents the purchasers. Assays from the vertical main working shaft, on the Silent, 184 ounces of silver to the ton, average; considerable metal is being sacked as they sink that will assay from 5,000 to 6,000 ounces to the ton, silver.

**VULTURE.**—Cor. Phoenix Herald, Mar. 12: The principal owner of the Vulture mine and mill, Mr. Seymour, on a visit here before he returned to the end of February's close-up. It was the best clean-up since the mill started, and I learn from good authority that the 14 days' pounding netted \$25,000. Take into consideration that amount taken out every two weeks, and then take an estimate of the amount paid to the very few hands employed all over the concern, and at a lower rate of wages than in any kindred institution in Arizona; it is not to be wondered at that it is a paying mine.

#### IDAHO.

**GALENA MINES.**—Yankee Fork Herald, Mar. 11: There are several galena mines about 5 miles above Challis, on Oarden creek, and near Challis' old saw mill. The Pinto and two others are owned by Fred Winterhoff, Charles Lichtenfeld and Fred Sperling. There is quite a lot of iron ore in the dump that will go for 50 or 60 ounces per ton. There is plenty of wood and timber handy, and if the mines prove good, which it is thought they will, they can be very profitably worked. They are situated in a country where there is no snow, and the work can be prosecuted as well in winter as in summer. We expect to see smelters running there in the near future.

**WOOD RIVER.**—Cor. Salt Lake Tribune, Mar. 11: The long expected boom will commence inside of the next two months. At present we are receiving many letters from all parts of the coast, from those who left here last fall to escape our winter. The country is as yet poorly prospected, but will give thousands a chance to show their ability as prospector and miner. The promise of Wood river gives everyone here a hope such as has never been since the discovery of gold in California. Thousands were produced here in 1880, but no product will be in 1881 no person can tell; all expect millions. The history of this new mining region has been one in which the general public has taken an unusual amount of interest, owing to the richness and the vast territory it embraces. This country is a poor man's country if ever there was such a one. The richness of our ores justifies their shipment to foreign markets, and leave a handsome profit to the miner. As has been said, the country is rich in ore shipments to Salt Lake, which has proven a good market for our mines. The business men are busily engaged in improving the looks of their various houses. The newspapers to be located here have created quite a sensation. All the people of Wood river are jubilant over the news. At Ketchum two shingle factories are busy at work this winter. Three blacksmith shops are located there. New strikes are reported in Calumet and Saw Tooth cities.

#### MONTANA.

**ALTA MONTANA.**—Helena Independent, Mar. 10: The mine is still having trouble to get enough wood to the works to keep all departments running, but the sneller is kept going on Alta ore, fluxed with the iron ore taken from the main ledge discovered by the works. Car lot of \$25,000, weighed up last Monday, is found to be very rich, carrying in the aggregate \$3,804.14. The ore of the Alta shows some gold, and the car lot had over \$120, besides the silver.

The Albion has made an excellent record for itself, and promises to continue to produce for its owners satisfactory results. At a depth of 50 ft a level was run about 130 ft, and all the ore taken out, amounting to 353 tons, without assorting, was milled. It produced \$1,007.17, or an average per ton for the ore worked of \$30.28. The vein worked from 6 to 11 ft in width, or an average of about 9 ft.

We learn that Prof. Hesse, now in Helena, will make a somewhat particular examination of what is known as the Ten Mile district, with the view to locating a developer at some advantageous point. It is not improbable that Buffalo gulch may be selected, as there is an abundance of wood and water in that vicinity.

The Original M. Co., of Butte, will start up work soon under the same management as the Boston & Montana G. M. Co., and the Gregory Con.

**HELENA'S FEEDERS.**—The Helena assay office yesterday received 3,000 ounces in gold and silver retort from the mill of Thomas Cruise, and 600 ounces of gold retort from various other parties, all within a radius of 25 miles of Helena. Such receipts at the assay office are now of constant occurrence.

**FROM PHILIPSBURG.**—New Northwest, Mar. 11: James Milligan was in from Philipsburg on Monday and reports the place tolerably quiet. The ore to be located is developed 2 or 3 leads. The shaft at the Cliff ledge is over 170 ft in depth. The work of sinking is being continued. Two levels are being run at 100 ft. The Algonquin hoisting works are in place and doing good work. The company are working principally on the Algonquin ledge. The water comes in very fast, and unless the flow ceases it will necessitate the getting of larger pumps than those now in use.

### Head of the Female Fur Seal.

We give on this page a side view of the head of the female fur seal, taken from the handsome work, "The Marine Mammals of the North-western Coast of North America," by Capt. Chas. M. Scammon. This book treats of the ocean mammals scientifically and commercially, and is a valuable addition to the library. The author says the fur seals have so wide a geographical range—extending nearly to the highest navigable latitudes in the northern and southern hemispheres—and are found assembled in such countless numbers at their favorite resorts, that they become at once a source of great commercial wealth; and among marine mammals they are the most interesting we have met with. The color of the full-grown males is dark brown, with scattering hairs of white about the head, neck and anterior portion of the body, and, in some instances, nearly approaches to black. At a distance, it is difficult to distinguish between an old male seal and a full-grown male sea lion of the California coast, the former being frequently found measuring 9 ft. from tip of nose to extremity of posterior flippers.

The females average fully one-half of the length of the largest males, and the greater

limbs are shaped much like the fins of the smaller cetaceans; the posterior ones have five distinct toes or digits, and three nails or claws project from their upper sides four or more inches from their hips, according to the size and age of the animal. The tail is extremely short and pointed. The ears are pointed also, slanting backward, and are covered with short, fine hair. The eyes are invariably dark and glistening, and have a human-like expression.

The intrinsic value of the animal does not depend upon the price of its skin alone; for the layer of fat adhering to it yields the oil of commerce and supplies light and heat to the natives in their dismal winter quarters. The flesh, likewise, afford them a staple article of food.

### Heat in Mines.

An opinion has long prevailed on the part of many persons that the extreme heat in the lower levels of the Comstock mines of Nevada is solely due to their great depth. It is an established fact that the heat existing there is so great in places that the miners can only work ten and fifteen minute shifts, and then in a state of comparative nudity. A scientist, who has given a great deal of thought to the subject, claims from the deductions he has made, that this heat alone is the result of chemical action, such as the presence of limestone, which de-

composes the decomposition of iron pyrites—masses of iron and sulphur. At Steamboat springs and other places in this State, and at other places in California, the heat is produced by the burning out or decomposition of iron pyrites. At Steamboat springs the course of the deposit of iron pyrites is northeast and southwest, the same as that of the great mineral-bearing veins of the State. The line of active springs follows the course of this deposit, moving toward the northeast. At the southwest end are to be seen places where the deposit of iron pyrites and similar minerals carrying large quantities of sulphur has burned out and the springs have died away. The process of burning out is slowly moving toward the northeast. In 1860 the writer saw a new spring just starting up through a thick growth of grass in a bit of meadow land far in advance of the older and larger ones, but on the same general line, well out to the northeast.

The base-metal deposit at Steamboat springs also has the same dip as the Comstock, and is working east as well as toward the north. By going from half to three-quarters of a mile west of the present active springs at Steamboat one may see where the springs were ages ago, along near the croppings or upper edge of the deposit of pyritic matter. As the decomposition proceeded downward and eastward along the dip of the deposit, the steam and hot water found or forced new vertical channels of escape. Some

### Manzanita Mine.

What is being Done at one of Nevada City's Big Hydraulic Claims.

Under Orrin Gowell's superintendence, operations at the Manzanita hydraulic claim in the northern edge of the city, are progressing favorably. This season's run has already extended over 65 days, and as there is some 20 ft. of hard snow in the Meadow Lake region, it is probable that that work can be continued till July. The company's new ditch, 7½ miles long and having a capacity of 1,500 inches, cost in its construction \$15,000. Only a thousand inches of water is running now. When necessary, an additional supply can be purchased from the Yuba Canal company. Sufficient fall can be obtained to work the entire claim, embracing 450 acres, only a small portion of which has been exhausted as yet. The pipe-clay is growing less daily, and an increased amount of good gravel is making in. The bank in some places is 200 ft. high, in others coming down to an inconsiderable height. Numerous seams of very rich gravel are now seen in it. Heavy caves frequently occur, but they accelerate rather than retard the working of the claim. When the last cave is worked off, or shortly after, the fabulously rich ground which comprised the old Live Oak drift diggings will be entered, when still larger profits than now are expected.

HEAD OF A FEMALE FUR SEAL (*Callorhinus urelinus*)— TWO-THIRDS OF NATURAL SIZE.

portion of them are of a silver-gray color; the very oldest, however, are dark brown on the back and sides, with scattering white hairs over all. The fur is reddish brown on the inside. The thick mixture of black, glistening hairs imparts the dark hue to the oldest animals, and the white hairs on the younger ones give them the silvery luster. Both old and young are of a lighter shade underneath, particularly about the pectorals and posterior portions of the body. The layer of fat, or blubber, between the skin and flesh may average 1½ inches in thickness, varying according to the time the animal has been on shore—it being very fat when the season begins, and very lean when the season is over, which changes the animal's appearance considerably from its former robust condition. When in full flesh the adult females weigh about 85 lbs.

The engraving affords a good idea of the outline of the head (side view), and the expression of the harmless mother, who bears her offspring and submits to the harsh treatment of her male companion and master, without manifest complaint or resistance.

The female rarely produces more than a single offspring. The pups when born are about one-third the length of the mother. They are covered with a thick mat of coarse fur, which changes to a finer texture and slighter shade as the animals mature. The time of bringing forth young on the coast of California is from May to August, including parts of both months.

The flippers of the fur seal are destitute of hair, being covered with tough, black skin, similar to shagreen, which is very flexible about the terminations of their extremities. The side

composes rapidly when attacked by carbonic acid gas and the action of water, qualities which are ever present in the mines. The decomposition causes the generation and exudation of intense heat, which, being largely confined in circumscribed space, greatly affects the comfort and convenience of the delvers of the deep while they are engaged in dislodging the argentiferous ores. The hot springs in Colorado and other States acquire their heat through similar action, and not by reason of depth, and this theory goes far toward substantiating the theory advanced. Mines of greater depth have been worked in Europe without the inconvenience of such heat being experienced, and indications exist that the mines in Old Mexico have been worked much lower down than those on the Comstock lode.

The above item is from the New York *Mining News*, and the Virginia *Enterprise* adds the following:

Lime is undoubtedly one cause of heat in our mines, but it is not the only nor the great heat producer. Lime is local in its action, the heat produced by it is confined to certain sections of the mines, while underlying the whole length of the Comstock lode is that which causes the general heat, namely, the deposits of iron pyrites.

The hottest places in the mines are where the heat is generated by both lime and pyrites; it is the heat from the lime added to the heat from Nature's workshop below.

The hot springs of Colorado may derive a portion of their heat from the decomposition of lime, but this is but a secondary cause. The great and first cause of heat in springs an-

of these openings are probably natural crevices, but the majority are undoubtedly rents produced by the force of steam and pent up gases. Even on the surface at Steamboat springs are to be seen long rents from an inch or two to over a foot in width that have a northeast and southwest course. In California some of the hot springs are observed to be dying out at one end of their line and advancing into new ground at the other.

At Steamboat springs we probably see a big mineral vein (like the Comstock) in process of formation. Ages ago there was probably a line of hot springs along the course of the Comstock. The mines of Europe and Mexico which are comparatively cold at great depths are undoubtedly age and ages older than the Comstock.

The Comstock is probably the youngest mine in any part of the world that is now known or being worked. Here, down in our lower levels, we are following close upon the heels of nature—getting well down into her workshop.

As to the heat-generating power of sulphur and iron, those who desire to do so may satisfy themselves. Take a few pounds of iron filings, borings and drillings from a machine shop, wet them and mix in a pound or two of sulphur, then tamp the mixture firmly into a hole in the ground—like a post-hole—covering with two or three inches of dirt, and in a short time there will be seen a miniature volcano, the batch of iron and sulphur taking fire spontaneously.

ORE assaying \$44 per ton was raised from the California mine this week.

It must be remembered that much of the ground belonging to the Manzanita bas, in years gone by, been dined by different parties, but by that process only an insignificant portion of the channel could be extracted. The present owners have expended in the neighborhood of \$150,000 on the ground within a couple of years. They expect to clean up as much as \$100,000 for this season's run, and that it will take them 30 years, more or less, to exhaust the deposit at the present rate of working, the profits increasing as they advance into the hill. Only two monitors are washing at present, and the visitor in vain looks around on the large force of employees for a heathen Chinese.—*Transcript*.

**HORN SILVER MINE.**—We learn from J. C. Lynch that there is not any truth in the report that has gone abroad to the effect that the old owners of the Horn Silver are about to repurchase the mine. The company is now very busily engaged arranging affairs to work the mine on a much larger scale. They are experimenting with a new process for working their ore, and should it prove successful, the company will be enabled to work its ore without calcining it. It now, by the present method, costs the company \$28 per ton to reduce its ore, but if the new method is a success, it will cost but \$13 per ton, which is an immense saving, and the company will then be able to thrive its working force. The three etacks at Frisco are running under full headway, and work is being vigorously prosecuted on the new furnaces now in course of erection near Salt Lake City. The outlook of Frisco is very bright, for there are several companies now operating there.—*Pioche Record*.

## THE ENGINEER.

**THE GREAT BRIDGE AT ST. LOUIS.**—A few years ago, in anti-bridge days, passengers were ferried across the Mississippi and landed on the crowded levees, at great inconvenience. But now, thanks to a great architect and mechanical skill, the tired traveler sits in his comfortable car until it reaches the depot in the heart of the city. The upper Mississippi has been spanned by 12 great railroad bridges, costing in the aggregate over \$20,000,000, and this one at St. Louis has cost as much as all the other 11 combined. This magnificent structure is a monument to the engineering skill of Capt. James B. Eads. How can we describe it? Four massive piers of granite reach down to a rock foundation, more than 100 ft. below the surface of the river, and rise 80 ft. above the water. These stupendous piers support three immense arches, each one 500 ft. long. The arches are composed of chrome steel tubes united by a vast network of iron braces. The bridge has two divisions, the upper portion being used for carriages, horse-car tracks and promenades. Through the lower division runs a double line of steam railway tracks, on which 100 daily trains go thundering back and forth. Leaving the bridge the trains plunge into a tunnel as dark as mid-night, and nearly a mile in length, passing under the city to the great Union depot. As trains now meet at this great central station, and twice a day, it is probably the busiest place to be found in the country; morning and evening one can see no less than a dozen trains standing there ready to depart to all points of the compass.—*St. Louis Times.*

**IMPROVEMENT IN ORDNANCE.**—In the matter of building large ships, and casting heavy guns, the American people have not kept pace with Europeans. The heaviest American-built ships are floating shells compared to the massive iron vessels England, France, Italy and other European powers have constructed; and the largest guns on American ships or seaboard defenses bear no comparison in the weight of missile thrown by the guns which are floated on European navies. It is now intimated that the discovery of what is termed a new system of ordnance, by an American, will do away with the improved cannon, which have been brought to their present state at such enormous cost. Late Eastern papers give long accounts of recent ordnance experiments in Washington, in which the new invention was tested. These experiments are reported as highly satisfactory, but still showing that the plans of the inventor are not yet perfect, or, rather, that they have been imperfectly carried into practice. The purpose of the inventor is to make war so destructive that, by common consent, it will be abandoned as a means of settling international difficulties.

**THE GRAND CANAL OF CHINA.**—This canal is likely to share the fate of the great wall. This water-way was constructed by Kublai-Khan and his successors of the Yuen race, and is 600 miles in length. There are 10,000 flat-bottomed boats on this canal, and these are used in the transportation of grain. The *Echo* states that this great water-way is an enormous "white elephant," as it costs an enormous amount every year for repairs, the appropriations there, as elsewhere, not being entirely devoted to the purpose for which they are meant. Junks are delayed every month while channels are cut for their passage. This year, for the first time since the construction of the canal, the grain from Nanking, with the consent of the government, has been forwarded by sea, and this fact has impelled the Peking authorities to consider the expediency of abandoning the canal as a commercial highway.

**THE CHANNEL TUNNEL.**—It is asserted that within 18 months two and a half miles of the proposed channel tunnel between England and France will have been excavated, and that the work will be completed in about four years. Still another grand scheme, however, for crossing the channel is contemplated, namely, a line of steel tubes, 16 ft. in diameter, ballasted so as to make it weigh one and one-fourth tons to the foot less than the water displaced, and held at a depth of 35 ft. below the surface, so as not to impede navigation, by chains attached to caissons sunk to the bottom.

**A HIGH BRIDGE.**—A bridge has recently been built over the Volga, in Russia, at a point where it is a mile in width. So great are the spring floods at that point, that the bridge has been built 100 ft. above the lowest level of the water; the depth of the river is more than 50 ft. The bridge rests on 14 piers. The girders are 364 ft. long and 20 wide, and were riveted together on the bank of the river.

**WHEAT SHIPMENTS VIA HUDSON'S BAY.**—Prof. Bell, who has lately returned from England, is gathering information in behalf of the Government to determine the feasibility of opening a route through Hudson bay, for the transportation of grain from the Northwest. It is claimed that grain can be laid down in Liverpool cheaper by the proposed route than by the all-rail route, the Canada Pacific railroad.

**RAILROAD CONSTRUCTION FOR 1880.**—The *Railroad Gazette* gives the amount of railroad construction in the United States for 1880 as 7,401 miles. The total mileage on Jan. 1, 1881, is set down as 93,898 miles.

## USEFUL INFORMATION.

## How to Coat Articles with Lead.

Professor Emerson Reynolds thus describes one of the best methods of applying his new process of galsuizing, or covering with lead various substances: Take 16 grammes of solid sodic hydrate (NaOH) or an equivalent of other suitable hydrate, dissolve it in 1.75 liters of water, and add to the liquid 17 grammes of lead nitrate (Pb2NO3), or an equivalent of other lead salt, with 250 cubic centimeters of water; raise the temperature of the mixture to 90° C. If sufficient lead salt has been added the liquid will remain somewhat turbid after heating, and must then be rapidly strained or filtered through asbestos, glass-wool, or other suitable material, into a convenient vessel. The filtered liquid is then well mixed with 100 cubic centimeters of hot water containing in solution four grammes of sulpho-urea or thiocarbamide. If the temperature of this mixture be maintained at about 70° C., deposition of galena in the form of a fine adherent film or layer quickly takes place on any object immersed in or covered with the liquid, provided the object be in a perfectly clean condition and suitable for the purpose. When the operation is properly conducted a layer of galena is obtained, which is so strongly adherent that it can be easily polished by means of the usual leather polisher. It is not necessary to deposit the galena from hot liquids, but the deposit iron is more rapid than from cold solutions.

The most convenient solution for deposition on brass is thus prepared: Take a quantity of soda lye containing 1½ ounces of real soda (NaOH); dissolve this, with the aid of heat, three ounces of tartaric acid, and just before diluting the solution to one gallon of cold water, add five drachms of sulpho-urea previously dissolved in a small quantity of hot water. The articles are to be immediately immersed in this bath, and the temperature raised to boiling. When the desired tint is obtained the articles are to be removed, washed and polished. The above solution can be used for glass or porcelain, hot or cold, if the proportion of alkali be reduced one-third or thereabouts.

**COPYING DRAWINGS.**—By a method patented by M. Joltrain, of Paris, it is claimed that copies of drawings having nearly black strokes on a white ground can be made by the following sensitizing mixture: Gum, 25 grammes; chloride of sodium, three grammes; perchloride of iron at 55° B., 10 cubic centimeters; sulphate of peroxide of iron, five grammes; tartaric acid, four grammes; water to fill up to 100 cubic centimeters. The developing bath may be a solution of ferrocyanide of potassium, red or yellow, acid or alkaline. The printing is done in the ordinary way, and the developing in a bath of red or yellow prussiate of potash. After washing the proof is put into an acidulated bath, which darkens the lines to an indigo tint, and is then again washed and dried.

**CLEANING WATER PIPES.**—A correspondent of the *Forest and Stream* gives a novel method employed to cleanse a two-inch water pipe which had become choked with mud. A string was tied into a hole punched in the tail of a small eel, which was straightway put into the pipe. An occasional jerk reminded the eel that it was incumbent on him to proceed, which he did, arriving at the lower end of the pipe with the string. A bunch of rags was tied to the string, and thus the pipe was cleansed.—*Locomotive.*

**FURNITURE POLISH.**—For a polish to clean up and brighten old furniture, pianos, etc., dissolve four ounces of orange shellac in one quart of 95-cent alcohol; to this add one quart of linseed oil and one pint of turpentine; when mixed add four ounces of sulphuric ether and four ounces of aqua ammonia; mix thoroughly before using. Apply with a cloth or sponge, and rub the surface to which it is applied until the polish appears.

A new leaden roof is being placed on the cupola of St. Peter's, Rome, which it will take two years to complete. Something of the magnitude of the building may be inferred from the fact that the roof was begun 17 years ago, and although the laborers have not been constantly at work, the work is enormous. The roof is divided into 16 sections, each of which requires 1,000,000 lbs. of lead.

**AMERICAN LEATHER IN ENGLAND.**—After having exported American beef, shoe leather has seemed to obtain a solid footing among English shoemakers, both on account of its cheapness and durability. 9,500,000 lbs. have been exported to England from the United States for the first six months of the last year, from January to July. The value of this is nearly £400,000.

**CELLULOSE IN A NEW ROLE.**—It is reported that celluloid has of late been successfully applied in the form of a veneer in the ornamentation of furniture. It is used in this way in imitation of malachite, or colored marbles, for table tops, and for panels in imitating tortoise-shell and other costly materials.

ONE gallon of neat's-foot oil mixed with four ounces of lampblack makes a good harness oil.

**COLORING GLASS.**—Oxide of gold is employed to impart to glass a beautiful ruby color. Suboxide of copper gives a red color. Silver, in all states of oxidation, gives a variety of beautiful yellow and orange colors of glass. Antimony, lead and silver, in combination, are employed to produce the inferior yellow color. The oxides of iron give to glass various shades of green, yellow, red and black. Oxide of chromium gives a fine green, the oxide of cobalt a splendid blue. The color most valued, next to that produced by gold, is the yellow communicated by oxide of uranium, and which has an appearance resembling shot silk. White glass or enamel is made by adding either arsenic or the oxide of tin to the melted metal. The various metals used in coloring glass are also employed in the manufacture of artificial gems, and by their means the color and general appearance are well imitated.

**ENCROACHMENTS OF GREAT RIVERS.**—The extent of the encroachments of rivers like the Mississippi and Missouri upon their banks can only be compared with what is taking place upon the south-eastern shores of Great Britain by the action of marine currents. Indeed, owing to the direct manner in which American rivers impinge upon their banks in certain parts, the destructive action is, in this case, still more rapid. Several thriving towns on the banks of the two rivers specified have within the last few years been swept away by the erosion of their banks.

**USEFUL HORNETS.**—Most persons may not be aware of the fact that there is an old-standing feud between the hornet and fly families. A farmer who was acquainted with this fact recently hung up in his parlor a hornet's nest which he found in the woods, and in a short time the house was thoroughly cleared of flies. Is not the remedy worse than the disease?

**CONVENIENT FOR TRAVELERS.**—An invention has been made in Hartford for announcing the stations on railroad trains, which can be worked by steam from the engine or by electricity, and a company has been formed, with a capital of \$100,000, to manufacture it, with W. H. Goodrich, of the Hartford *Courant*, as president.

**HOW TO SOFTEN RESIN.**—Melt the resin, and while in a state of fusion add tar. The proper degree of hardness can be ascertained by dropping a small portion of the melted mass into water.

## GOOD HEALTH.

## Oxygen as a Curative Agent.

Is oxygen a curative agent? The wonderful power which it possesses of destroying organic matter, and the purifying effect which always results therefrom, has led us, reasoning by analogy, to believe that many diseases which are now regarded as incurable, would succumb to the cleansing power of this element. The air contains only 20.95% of oxygen, the remaining 79.05 parts being composed entirely of nitrogen, which serves to dilute the oxygen. The depressing effect of a smaller amount of oxygen and increased amount of carbonic acid is felt when one has been for a short time in a poorly ventilated room.

In mountainous countries, where the height above the sea level is not too great, the refreshing effect of the air is proverbial. This is simply because the proportion of oxygen is greater and of carbonic acid less.

The purifying effect of oxidation is strikingly shown in running brooks. Here water which is unfit to drink on account of organic impurities, becomes pure by running a mile or two. This change is due to the fact that in the act of flowing each particle of the water is brought into contact with the air, and absorbs the necessary amount of oxygen to combine with the organic matter, thus destroying it.

In many diseases a "change of air" is recommended as a cure, or at least as a source of relief. In its incipient stages consumption may often be cured by vigorous exercise in the open air, and by living wholly out of doors.

The benefit derived from pure air and exercise is due entirely to the large amount of oxygen which exercise—such as horseback riding—enables and compels the patient to inhale. The organic germs of disease are thus oxidized and destroyed.

We submit, then, to the public for consideration, the question: Will not the breathing of pure oxygen gas prove to be the solution to the problem, "How shall we treat consumption?" There is a well authenticated case in which a child was cured of hydrophobia by inhaling three cubic ft. of oxygen. In this case blood poisoning was the evil, and oxygen seems to have combined with the poisonous principle, thereby destroying it.

A young Frenchman who has recently been experimenting upon himself, finds that he can inhale oxygen without experiencing any ill effects. He took as much as 100 liters a day for several days. The writer has often inhaled oxygen for experimental purposes, and its use was never followed by any unpleasant effect.—*Hall's Journal of Health.*

THE TERRIBLE CRAMP COLIC, so often fatal before the dawn, can often be relieved within an hour with a milk emetic, and flannels, wrung in boiling water, applied to the stomach.

**MEDICAL USES OF EGGS.**—For burns or scalds, nothing is more soothing than the whites of an egg, which may be poured over the wound. It is softer, as a varnish for a burn, than collodion, and being always at hand can be applied immediately. It is also more cooling than the "sweet oil and cotton," which was formerly supposed to be the eures application to allay the smarting pain. It is the contact with the air which gives the extreme discomfort experienced from ordinary accidents of this kind; and anything which excludes air and prevents inflammation is the thing to be at once applied. The egg is also considered one of the best remedies for dysentery. Beaten up slightly with or without sugar and swallowed, it tends by its emollient qualities to lessen the inflammation of the stomach and intestines, and by forming a transient coating on those organs to enable nature to resume her healthful way over the diseased body. Two or at most three eggs per day would be all that is required in ordinary cases; and since the egg is not merely medicine, but food as well, the lighter the diet otherwise, the quicker the patient is kept, the more certain and rapid is the recovery.

**NEW TREATMENT FOR SCARLET FEVER.**—A very interesting experiment was tried by Dr. Ashby, medical officer of health for Grantham (England), in dealing with an outbreak of scarlet fever in that town during the summer of 1878, by means of isolating the patients in tents. He prevailed upon the local authorities to erect a tent hospital on the outskirts of the town, and induced parents to send their sick there. The result was most successful. Parents availed themselves of the tents largely (their early prejudice against them being readily overcome), the patients did remarkably well, and the spread of the disease was unquestionably much curtailed. Altogether the example set was one which deserves to be copied, and shows with what readiness the spreading diseases of children may be dealt with by the exercise of energy and forethought.—*Lancet.*

THE STING OF A WASE, or bee, or yellow-jacket has often proved fatal in five minutes, when the prompt application of hartshorn to the wound, and a few drops swallowed with water, would have antagonized the poison and saved the life; but in a dozen houses in the country there might not be found a drop. It may be useful to know that a bit of soap or a handful of wood ashes stirred in a glass of water, makes a good hartshorn substitute in half a minute; or, if there be not a wood fire in a mile, a handful of moist earth grabbed from the first mud-puddle, or pond, or brooklet's edge, contains hartshorn and other curative elements, which, if applied in the shape of a poultice, gives instant relief to the sufferer.—*Dr. Hall.*

**THE WAY TO REST.**—To understand this is of more importance than to know how to work. The latter can be learned easily; the former it takes years to learn, and some people never learn the art of resting. It is simply a change of scenes and activities. Lazing may not be resting. Sitting down for days with nothing to do, is not restful. A change is needed to bring into play a different set of faculties and turn the life into a new channel. The man who works hard finds his best rest in playing hard. The man who is burdened with care finds relief in something that is active, yet free from responsibility. Above all, keep good natured and don't abuse your best friend, the stomach.—*Sol.*

**THE CROUP.**—Toward midnight, after the first sleep, the hateful croup usually fixes its dreadful fangs on the unconscious child. What averts it in the country, miles away from a physician or a drug store, that this, that, or the other remedy is "good for" the disease, when neither physician nor remedy could be had for hours; and all this while the mother is in agony, and the infant sufferer clutches its throat for breath? In such an emergency no medicine known is so potent for cure as a hoiling teakettle and a bit of flannel; or, as a lump of ice or snow, with a handful of salt, applied to the throat in a silken pad or bag.—*Dr. Hall.*

**WAR ON THE POTATO.**—Dr. Heath, a scientist of New York, has ventured upon dangerous ground. He read a paper before the Farmer's Club, in which he opened a war against the time-honored potato. It is an agent, he says, in producing obesity. Many lean persons will be glad to learn that they will double on the potato ratio at once. "Ah, hut," says Dr. Heath, "the potato makes the wits fat, also;" and further, "after the lapse of a few generations it dwarfs, mentally and physically the people who live upon it." As in the admixture of food, the potato has not been proved dangerous during several centuries, we think people will be willing to trust it in the future.

**AN OLD IDEA UNDER NEW CONDITIONS.**—Attempts have been made to propel boats on canals and rivers by conducting a column of water through a pipe and rejecting it forcibly at the stern, but they did not prove successful. An Englishman now claims to have got over the difficulty by showing "the force exerted by one fluid pouring into or against another depends on the contact of surfaces, and not on the sectional area of the flowing mass, after it has once set in motion." Instead, therefore, of tubes with large orifice, he makes use of tubes with narrow outlet, a mere slit, and thus obtains a large superficial contact by ejecting water through a series of narrow openings.

## TABLE OF CONTENTS.

GENERAL EDITORIALS.—Underground Surveying; Selling Mines; Mining Statistics of the State of Nevada; Mining and Railroad in Mexico, 177. The Week; Mining Investment; Ratio Between Wages and Cost of Living; Polar Exploration, 184. Coal in Arizona; The Curtis Wine Heater; A New Vine Pest, 185. The World's Fair—A New Hitch, 183.  
 ILLUSTRATIONS.—A New Instrument for Underground Surveying, 177. Head of a Female Fur Seal, 182. The Curtis Wine Heater, 185.  
 CORRESPONDENCE.—Review of the Beet Sugar Industry in the United States During 1880, 178.  
 MECHANICAL PROGRESS.—Progress in Machinery; Driving Nails by Machinery; Castings; Welding by Electricity; The Locomotive a Precedent for Higher Piston Speed; New Method of Generating Steam, 179.  
 SCIENTIFIC PROGRESS.—Unrecognized Qualities in Charcoal; A Powerful Light; An Electrical Elevator; Perazotic Acid; Uses of Chemistry; Scientific Progress; An Aluminum Battery; Number of Plant Species, 179.  
 MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 180.  
 MINING SUMMARY from the various counties of California, Nevada, Arizona, Idaho, Montana and Oregon.  
 THE ENGINEER.—The Great Bridges at St. Louis; Improvement in Ordnance; The Grand Canal of China; The Channel Tunnel; A High Bridge; Wheat Shipments via Hudson's Bay; Railroad Construction for 1880, 183.  
 USEFUL INFORMATION.—How to Coat Articles with Lead; Copying Drawings; Cleaning Water Pipes; Furniture Polish; American Leather in England; Coloring Glass; Encroachment of Great Rivers; Useful Hornets; Convenient for Travelers; How to Soften Resin, 183.  
 GOOD HEALTH.—Oxygen as a Curative Agent; Medical Uses of Eggs; New Treatment for Scarlet Fever; The Way to Rest; The Croup; War on the Potato, 183.  
 MISCELLANEOUS.—The Coal Fields of Arizona; The Murbles Mine; Hiko; Gold Mines near Bishop; Pyramid Lake Mines; Mining Altitudes; Nevada Ashes; Women and Mining; The Providence, 178. Head of the Female Fur Seal; Heat in Mines; Marzanita Mine, 182. Encouraging Mining Prospect, 183.  
 NEWS IN BRIEF, on page 188 and other pages.

## Business Announcements.

Frns Ore Concentrators—Joshua Hsudy, S. F.  
 Coal—J. Macdonough, S. F.  
 Philadelphia Stone and Marble—Richard C. Remmsy  
 Dividend Notice—Eureka Con. M. Co.

## The Week.

As the season show signs of opening, prospectors who have been hibernating the past six months, begin to come out and scatter over the hillsides. Wood River, in Idaho, Montana, Alaska, Arizona and New Mexico are all attracting attention, and hundreds of men are going to those places in search of fortune. Meantime, prospecting is by no means abandoned in California and Nevada, and though new strikes are not so frequent as in newer regions, yet we are not entirely lacking in such excitements.

The news of the week shows that great activity prevails in mining matters—mines especially south of here. A good deal of machinery is going into Arizona and Mexico.

Up on the Comstock there is not much doing at present, but a development at any point along the lode would set all the old machinery humming again in about 15 minutes. The news would cause a rush to places and to arms, such as is seen at a country hotel at the stroke of the gong. It is only a matter of time, though of course the "time" seems long to such as are anxious to be making money every day and every hour. The present generation will still leave something for the coming generation to do on the Comstock.

GEO. T. MARYE, President of the San Francisco Stock Exchange Board, denies the published rumor that the Stock Exchange building is to be purchased by the Western Union telegraph company, or that it is for sale, and states that the rumor has been manufactured out of whole cloth.

THE Royal Astronomical Society are taking into consideration the endorsement of scientific research.

## Mining Investments.

If there are any men in this city who have had their money in mining stocks and have been fortunate to get it out, and who are now looking out for ready investment of that money, what numerous openings there are for them if they move quickly enough. As the spring opens, mining camps livn up, prospectors go to work, and a general revival of interest is manifest.

In California every mining county presents opportunities for the investment of capital. There are hundreds and hundreds of mines and prospects lying undeveloped for want of money to open them or put up necessary machinery. By investing in this class of property men may be able to be near the mines, and exercise more or less personal supervision over the work.

We do not mean by this that incorporations should be formed to sell stock to other people, but that the money should be directly invested by the individual or individuals. When this is done, and the cumbersome machinery of the companies dispensed with, a much more economical state of affairs exists.

Arizona and New Mexico both offer golden opportunities for men of means. Neither of them are good places for poor men, for they are now over-populated with that class of citizens; and working miners will not be needed in greater numbers until the mines now being opened are more fully developed.

Old Mexico itself is coming to the fore. Within the past two years the trade with Mexico has doubled from this city. A new steamer is now being built here to accommodate the increasing traffic. The completion of the Southern Pacific line, not far from its northern border, will also tend to open up Mexico.

Then Idaho and Montana both offer facilities for men of capital to increase their stock. First-class mines are being opened up in both these Territories, and the coming year will more than double the bullion product.

Alaska, too, is expected to come to the front as a bullion producer. As yet, however, very little is known of the mines, but this summer will prove them up.

Both Nevada and Utah offer many opportunities for investment of capital. The latter is getting over its hard time, and in doing legitimate mining work, is making more of a show than it did in the days of paper excitement. Nevada has many districts which, under the old extravagant ideas of mining, would not pay, but which under more economical management and careful working ought yet to yield millions.

SUBSTITUTE FOR PLATED METALS.—An Englishman has invented an alloy which provides an inexpensive substitute for bell metal, silver and nickel or electro-plated metals, used for making chips' fittings, harness fittings, taps and cocks. The alloy is composed of 45 to 60 parts by weight of refined copper, 20 to 30 parts of zinc, 18 to 25 parts of nickel, and if the castings are required to be turned, two to three parts of lead. The proportions can be varied according to the purity of the metals used, and the color or quality of the alloy to be produced. The copper and nickel are first melted together in a crucible, and the temperature is allowed to fall. When the zinc, or zinc and lead, are added with a small quantity of potash, soda and borax, the whole is covered with finely powdered charcoal; the temperature is then rapidly raised and the whole well stirred, then skimmed and immediately poured into the molds, or it may be cast into ingots first, in which case a greater percentage of zinc is added to make allowance for waste of the metal in re-melting. Articles made from this alloy take a brilliant polish, and in appearance resemble silver or nickel.

A GOOD STRIKE.—We see by the *Tuolumne Independent* that Garrett & James took out of the old "Turner claim," situated on Bald mountain, a short distance from Sonora, \$6,000 last week, and \$2,000 in one day this week—with more in sight. This claim has been fabulously rich in ye olden time and was considered "worked out"—but like many other mines, new blood having been instilled in them, something good has come out. Garrett, about eight years ago, left this claim, after working industriously for several years, with small profits, and established himself on the San Joaquin, where his crops dried out and burst him up. He returned to Tuolumne, and in company with another man started in his old diggings with the above refreshing results.

FIRE NEAR A POWDER FACTORY.—A fire took place at Damon's landing, near Melrose, Alameda county, last Sunday morning, about two o'clock, which destroyed entirely a warehouse containing nearly 200 tons of hay. The warehouse, we are told, stood within 100 ft. of the factory of the Thunder Powder Co., and notwithstanding the heat neither the factory nor the powder—nearly 10,000 lbs. stored ready for shipment—were in the least injured.

In Carson Valley and Truckee Meadows the ranchmen are doing their work in fear and trembling. The plow is turning up myriads of grasshopper eggs. Some of them are seriously considering the propriety of putting in no crops this season.

## Ratio Between Wages and Cost of Living.

We have taken some pains to gather up and collate a few statistics relative to the maximum average and maximum rates of wages paid for labor during the past two or three years in various sections of the United States, and also the correlative figures showing the corresponding fluctuations in the cost of living for the same time and in the same places. The article we have written to show these things is worth preserving for future reference, and should it prove to be duly appreciated by our readers then shall we have been fully repaid for time and labor expended.

One of the most curious things about the ratio existing between wages and the cost of living is the fact that, for all practical purposes, it is a constant quantity, or nearly so. To illustrate, let us suppose a mechanic receives \$40 per month, and pays out \$20 in the same time for living expenses. Now the ratio between his wages and expenses is 2. If, on account of some sudden "panic," his wages are cut down to \$30, and by dint of economy he manages to live on \$15, the ratio remains the same as before, 2. If he goes to a mining town and earns \$100 per month, while it costs him \$50 a month to live, it will be seen that the ratio is still unchanged, being simply the quotient arising by dividing the one number by the other. It is true, he now makes \$50 per month, which sounds very well abroad, but his employment is not always steady.

When we say, then, that this ratio is a constant quantity, we simply mean that, as economists have it, all circumstances being taken into due consideration, the ultimate result "amounts" to about the same thing to the laborer as to the mechanic, whether he works in a country where very high, average or very low wages are paid. It will thus be readily seen that the gist of the whole matter turns on that quaint aphorism which recites that the smallest excess of income over expenditure is wealth, while the smallest excess of expenditure over income is poverty.

The actual necessities of life cost so little in ancient Italy, that a Roman soldier could follow Caesar through all his extended campaigns, and yet save money enough to support a family out of his wages, which reached only about 14 cents a day, since it is well known that *denarius*, or Roman penny, was a soldier's daily allowance. And so, also, in our Savior's parable, the idlers who were called from the market-place, the general rendezvous for such fellows, received each man a "penny," whether they had borne the heat and burden of the day, or dragged into the vineyard at the eleventh hour.

According to a large array of statistics on file at Washington, it appears that the cost of living and average wages paid for labor have decreased about 15 per cent. during the past three years, in all parts of the Union except Colorado, California, Oregon, Minnesota and Washington Territory. In Colorado and New Mexico there have been an increase in the rate of wages paid for labor and a corresponding increase in the cost of living in those countries. These changes are due to the effect of large mining operations. Eighteen months ago, the average rate of wages paid to farm hands throughout all the States, was \$22.60 per month without board. Now, the average rate is \$20.31, or about 10 per cent. less. During a similar lapse of time in New York, New Jersey and Pennsylvania, the wages paid for farm labor has fallen over 50 per cent., while the cost of living has fallen about 10 per cent. In Virginia, Maryland, North and South Carolina and Georgia, wages have fallen 15 per cent., and the cost of living 16 per cent., thus effecting almost an absolute compensation. In Alabama, Mississippi and Louisiana, wages have fallen 5 per cent. and the cost of living 3 per cent. In Ohio, Illinois, Indiana, Michigan and Wisconsin, good farm hands now receive about \$23 per month; while a little further West, say anywhere between the Mississippi and Missouri rivers, the average pay is \$23 81. Commencing with Ohio, the figures in the last mentioned States have not materially changed for a year past. During the summer of 1877, it appears that wages throughout the country reached the lowest figures known in many years. Laborers in California receive higher pay than those east of the Rocky mountains, but then, as a rule, they are only employed during the hurried part of the season.

From what has been said, it will be easy to conclude that common laborers do fully as well in the end, in the Atlantic and Lake States as in the Pacific States and Territories. To resume the thought already touched upon, there are evidently deep under currents prevailing the great labor systems of our land, which, seemingly without the knowledge or consent of human agency, are eare to empty, sooner or later, into the undisturbed ocean of reciprocity. Justly considered, this is a study no less interesting to the employer than to the employed, and worthy to be rated as one of the leading economies of the day.

THE Tombstone M. & M. Co. has declared the usual monthly dividend of 10c per share, aggregating \$50,000. This mine has now been on a dividend-paying basis just one year, during which it has paid, including this dividend, \$600,000.

## Polar Exploration.

The steam whaling bark, *Mary and Helen*, recently purchased by the Government for \$100,000, has been taken to Mere Island, to be refitted for the search expedition after the missing *Jeannette*. Her whaling outfit is to be taken out of her, that not being included in the purchase. By the time the vessel is refitted at the Navy yard, she will have cost the Government a good round sum. Her actual value was perhaps \$35,000 to \$40,000, without taking into account the contingency of profits for the season; but, of course, like all Government purchases, two prices had to be paid. Not that the vessel is not a good one in her way, as she is new, strong and well built. It is probable, however, it will be found that she is much too large for the purpose intended. Speed is of little object where sometimes they do not make a mile a year; but size is a very important factor where the vessel has to be worked in narrow leads, and often "tracked" or hauled along by the men. A vessel this size of the *Corwin*, which went up last year, would be much more convenient.

The selection of officers and men for this expedition will be made in Washington, and it is generally believed that Lieut. A. G. Berry, U. S. Navy, will command the expedition.

We do not know what Mr. Berry's experience may have been, but think that a very careful selection should be made of some one with experience in Arctic waters. Capt. Hooper, of the *Corwin*, who went up last year, would have been an excellent choice, as his researches and experience would have been invaluable. His ice pilot, Capt. Smith, now on a whaling voyage, we believe, would also have been a valuable assistant. The assistance of one of the experienced whaling captains would also be of great service. Dr. W. H. Dall, of the Smithsonian Institution, who has spent so many years in coast survey work in Alaska, on his schooner, *Yukon*, would be among the best men that could be found if he would be willing to go. His great general knowledge, scientific ability, and experience with the currents, etc., of the coast, make him eminently fitted to command the expedition. Among others, Lieut. Schwatka was an available man. It is to be hoped that the expedition will not be given in charge of some one who has yet to gain his experience in the Arctic, as much valuable time will be lost if such is the case.

In this connection it may be stated that among the stories current in New York is one that James Gordon Bennett is seriously contemplating an Arctic expedition. Larry Jerome, who is in Europe with him, has recently written to a friend that, while Bennett is enjoying himself greatly as master of a hunt somewhere in England, he is very much depressed and anxious over the Arctic expedition which he equipped and sent out in the name of the *Herald*. He conceived it to be his duty to fit out another expedition in search of the last one, and take command of it himself. He has already telegraphed to stop work on a new yacht he contemplated building in this country, and thinks the money he proposed to spend that way shall be devoted to the building of a vessel to be speedily constructed with the view of encountering ice in the Northern seas. Already he has had some interviews with Scotch ship-builders on the subject. Therefore, the news that Bennett has seriously entered upon this new project may be expected at any time. It is characteristic of Bennett that execution follows closely upon the heels of conception.

News comes from Washington that two polar expeditions are to be fitted out and sent north early in the coming summer, under the direction of General Hazen, Chief Signal Officer, for purely scientific purposes. One, to Lady Franklin's bay, is to be under the command of Lieutenant Greeley, one of the most trusted officers of the Signal Corps; the other will sail from San Francisco and will establish itself at Point Barrow, on the north coast of Alaska. The commanding officer of the second expedition has not yet been designated.

THE Hite mine of Mariposa county, California, has been sold to some New York capitalists for \$600,000. This mine has been worked for 15 years, during which it has paid 38 dividends of \$1,370,000, the last being paid, according to a New York authority, in August, 1878. The claim contains 1,000 ft. It was formerly incorporated with a capital of \$10,000,000 in 100,000 shares. Papers of re-incorporation were filed in New York on the 1st of March, 1881. The present capital is \$2,000,000 in 200,000 shares of \$10 each. It is said that the mine has produced \$3,000,000, and that it is now producing largely. A new superintendent has assumed charge, and the renewal of dividends is promised at an early day. The Trustees are as follows: Wm. S. Clark, John R. Bothwell, Rufus P. Lincoln, M. Furman Hunt, John R. Hite, Mason W. Tyler and A. J. Bothwell.

THE Richmond Con. M. Co. paid a quarterly dividend of \$2.50 per share in London on the 5th of February. This dividend amounts to \$135,000, and added to those previously paid, shows an aggregate of \$2,855,250.

BELCHER is getting some fine pumprode of Oregon pine, each stick being from 60 to 80 ft. in length, and 16 inches square and as straight as a line.

## Coal in Arizona.

In our last issue we gave the statement that a valuable addition to Arizona's mineral wealth had been made in the discovery of beds of coal. Through the kindness of a correspondent of the Press we are enabled to publish the following particulars.

I write to inform you and through you those who are interested or contemplate investments in Arizona, of the latest and in many respects the most important discovery yet made in this Territory,—that of extensive coal deposits. The location is near Saddle Mountain, 20 miles northeast of the junction of the Gila and San Pedro rivers, and on the upper waters of Deer creek. This is 80 miles from this place in nearly a northerly direction and a shorter distance southeast from Florence. Some two weeks ago David Anderson brought in some specimens, claiming it to be coal, some of which he had used at his mine sharpening picks and drills. The news was quickly circulated about town, but created no very deep impression. However a party was fitted out by George Martin, James W. Oates and Geo. Cook, which went out to prospect the country about the head of Deer creek. The result of a week's search was the discovery of a much larger body of coal than David Anderson's party had found. This latter showed croppings, float and shale, in the easterly end of a valley about 12 miles in length, and all the ground in this vicinity with coal on the surface had been occupied when the second party reached the valley. They, however, followed down the same, occasionally finding evidences of the presence to coal, till near the southwestern end of this valley they found hundreds of acres literally covered with coal croppings. Where the waters, rushing down a wide canyon had cut a wash-out of 20 ft. in depth they found the black walle reaching from the bottom to the top, while the floor of the wash was not still through the deposit. An examination of the location discloses, what would appear at a cursory glance, to be 30 ledges all dipping into the hill to the southeast at an angle of 20°, but which are doubtless, only one or two, the surface being marked somewhat with the debris from the tall hills on that side. This party, with a few others who joined them in this valley, located 1,240 acres. In a few days this valley was full of prospectors making locations, and now nearly the entire valley between the two original discoveries is taken up and occupied.

Specimens from this southwestern discovery were brought to this city yesterday morning, and has been tested. It is a fine quality of semi-bituminous coal, generates gas well and cokes beautifully. It is free from impurities and deleterious matter, and is pronounced by competent judges to be the best article or quality of coal for this country.

This coal field is not more than 25 miles from the point where the extensive copper smelters are soon to be erected by Mr. W. A. Ballinger, and will supplement the smelting industry southeast of Globe, now bidding fair to be very large and extensive. A competent engineer estimates the cost of constructing a railroad up Deer creek to the mines at \$10,000 per mile.

Unquestionably this is a most valuable discovery, and will satisfy a need long and seriously felt in Arizona.

**A DAY'S DELAY.**—Under the writ of prohibition in the matter of the constitutionality of the debris act, now before the Supreme Court, a restraining order was asked for on Saturday to restrain the State Controller from issuing and the Treasurer from paying any more warrants upon the debris fund. Under the representation of Attorney-General Hart that there remained only some \$10,000 or \$12,000 in the Treasury to be paid out on account of debris warrants, the Court did not grant the order on that day, taking it under advisement until Monday. On Monday morning, immediately upon opening the Court, the restraining order was issued, and was placed in the hands of an agent to be taken to Sacramento and served on the proper officers. The warrants reached Sacramento too late for service on Monday, but upon the opening of the public offices on Tuesday morning, the order was served upon the Auditor, and the agent at once proceeded to the office of the Treasurer, who was in the act of paying several thousand dollars on a debris warrant. The order was served and the Treasurer refused to pay over the money. Five or six contractors were at this time waiting in the office to be paid. The Treasurer stated that he had been telegraphed on Monday that a restraining order had been issued, but not having been served with it as the law directs, he had paid out money on debris warrants during that day to the amount of \$212,000. There remain at present outstanding warrants to the amount of \$56,769.48, which the order prevents the Treasurer from paying.

A DISPATCH from Victoria, B. C., says: A Mr. Bent has arrived in town from Cowichan, and reports having discovered a lead of gold and silver-bearing quartz of great richness in the mountains, not far from the Kokesaliah quartz mining company's claim. He is said to have rich specimens, and is on his way to California to have them assayed.

## The Curtis Wine Heater.

This engraving represents a California invention of which the simplicity of construction, economy and perfect adaptation to the ends required, gained for its inventor the flattering encomiums and silver medal of the jury of awards of the Paris exposition of 1878, over all European competitors, and which certainly deserves the careful investigation of American viniculturists.

The object of the machine is to preserve wine after it has acquired its best condition after natural fermentation, against secondary fermentation, and all diseases which arise from the development within the wine of animo-vegetal parasites, such as bacteria, vibria, mycodermis aceti, etc., to liberate carbonic acid from the wine, and to render inert all glutinous or albuminous matters which cause the wine to be "rebellious" during clarification. The machine is simply the mechanical application of the well-known and well-established theory of the eminent chemist M. Pasteur, that the subjection of any fermented liquor to an instantaneous heat of 45° to 55° centigrade (112° to 131° Fah.), or to a slowly acquired temperature of 65° to 75° centigrade (149° to 167° Fah.) will destroy or render inert all germs of fermentation or of animo-vegetal life existing therein.

The development of M. Pasteur's system in Europe has been very rapid since 1869. It has been adopted by the French government which applies it to all wine used in the navy, enabling the cheap, light red wines of France to withstand long sea voyages, and exposure while on draught. The French vigneron has found

seconds exposure, while the California machine required only three seconds.

The flavor of wine passed through this heater is in nowise changed, nor is the process attended with any loss of alcoholic strength or of aroma. By the judicious and careful use of it, all wines are preserved, and can safely bear transportation and a moderate degree of exposure to the atmosphere. Most wines are mellowed and ripened by the process, and no wines are injured by it.

For heating the water-bath, a farmer's kettle (portable or stationary) may be used, or a copper still (the cap being removed), or a vat heated either by direct or indirect steam. The capacity of the heater within this range of 50 to 600 gallons per hour, depends on the capacity of the furnace to impart heat to the water-bath.

To operate the heater, place it over the water-bath, the tubes immersed 16 inches, leaving the bottom of the pan two inches above the surface of the water. The support for the heater should be a cover to the water-bath, so that no steam may escape from it. Connect the feed-cock (seen on the left in the engraving) with inch hose leading to the reservoir of wine to be heated. From this reservoir to the heater, the fall should not be less than six ft. To run 600 gallons per hour the fall must be 12 ft. or more. Connect the discharge valve (seen on the right of the engraving) by inch hose with the casks to be filled with the heated wine. When the water-bath is heated nearly to the boiling point, open the feed-cock (the discharge valve being closed) until the heater is filled, which will be indicated by the wine discharging from the air-cock (seen in the center of the engraving); then close the air-cock and open the discharge valve sufficiently to allow as large a flow of wine as the water-bath can heat to the required temperature. The thermometer (seen in the engraving

THE CURTIS WINE HEATER.

that heat properly applied, not only preserves their wines but gives them mellowness, fullness of body, and to red wines, increased brilliancy of color.

All the advantages derived by French and German wines from this system, accrue in even a more striking manner to California wines, which are often rough to the palate, of bad color, and tending to develop an excessive amount of free acid, or to become "milk-sour." These evils as well as obstinacy in clarification are completely overcome by the use of the "Curtis Wine Heater," and sweet wines which under ordinary conditions require fortification to the extent of 18% to 20% of absolute alcohol may be safely shipped at 10% to 15% if properly treated by this method.

The advantages claimed by the inventor for his machine, over all others which have been devised for this purpose, are

1. Economy and durability of construction.
2. Compactness and lightness.
3. Its easy adaptation to any appliance the viniculturist may possess for heating the water-bath.
4. Economy of fuel, one-half the heat acquired through the water-bath being imparted to the inflowing wine.
5. Simplicity of operation and perfect control of temperature.
6. Entire freedom of the wine during the process from exposure to the air, or to any metal except pure block tin, with which all the interior surfaces of the heater are lined.
7. The instantaneous heating and cooling of the wine. Working the heater at the moderate rate of 300 gallons an hour, each drop of wine is exposed to the heat only three seconds, thereby avoiding the "cooked" flavor and insipidity attending a more prolonged exposure, and requiring a less degree of heat than is necessary when it is more slowly applied.

In this connection it is proper to remark that the first appliances used for heating wine by Pasteur's system required from half to three-quarters of an hour; under those circumstances a temperature of 160° to 175° Fah., was necessary. The best European machine exhibited at the Paris exposition of 1878 required 40

ing between the air-cock and discharge valve) indicates the highest temperature imparted to the wine, and its indications are easily controlled by allowing a larger or smaller stream to flow through the discharge valve.

The air-cock should be frequently opened to permit the escape of any carbonic acid gas which may be liberated during the passage of the wine through the heater. The discharge of this gas is enormous from some wines, requiring the air-cock to be kept partially opened all the time. The disengagement of the gas is one of the greatest advantages derived from the process, although it was not foreseen by M. Pasteur, and in most heating machines no provision is made for its discharge at the moment of liberation from the wine, and it is consequently re-absorbed to a greater or less degree.

For heating sweet wines, a temperature of 130° to 135° Fah. should be used; for dry wines, 125° to 130° Fah. If the wine has a temperature of 70° when flowing into the heater, and is raised to 130°, it will flow out at 100°, one-half of the acquired heat being imparted to the inflowing wine. After use, the thermometer should be removed, the heater thoroughly cleaned by running water through it, and occasionally the tubes should be unscrewed and freed from any sediment which may accumulate in them. With careful use, the machine will last for many years without repairs. Any damage arising from accident or long-continued use is easily repaired by any good coppersmith. Duplicate thermometers are furnished at cost whenever required.

The "Curtis Wine Heater" is manufactured and sold in this city by its inventor, Mr. J. M. Curtis, a gentleman well-known through his connection for many years past with the California wine trade.

Mr. B. F. Clayton, editor and publisher of the *American Wine and Grape Grower*, New York, is the general Eastern agent.

A LAW was passed by the last Nevada Legislature exempting from attachment \$120 per month of a man's wages. This will make it rather difficult for miners to get credit at the stores, as business will be done on a cash basis.

## A New Vine Pest.

A Fungus that Destroys Phylloxera.

Dr. H. W. Harkness read the following paper before the California Academy of Sciences at its last meeting:

"A few days since, my friend, Dr. Behr, presented me with some grape roots obtained from a vineyard in Sonoma valley, which has been, and still is, suffering from the ravages of the phylloxera. An examination of the roots disclosed the presence of an abundant mycelium of some fungus which was distributed over the surface of the bark, forming an exceedingly delicate network covering nearly its entire surface. At times these filaments unite so as to form a cord which may be traced some distance by the unaided eye. When freshly gathered this fungus is silvery white in color; on exposure to the sunlight, it, however, soon changes to a dark brown. In this condition it is difficult to detect its presence without the aid of a lens. A microscopic examination reveals the fact that this mycelium permeates the entire bark, finding its way apparently to each individual cell, until it reaches the woody fiber, where it is plentifully distributed between it and the bark. Here its progress is arrested for a time at least, as I have as yet found no evidences of its having penetrated beyond, although I deem it nearly certain that the woody fiber will yield to its attack during the later stages of its growth. In its present condition I find it destitute of fruit. This fungus is a species of rhizomorpha, a root fungus. It is not new even in this State, as I discovered it some years since upon the roots of a lemon tree, which had exhibited signs of disease.

This pest is known in France as the *pourridie de la vigne*, and by the viticulturist as "pourridie," "champignon," "blanc" and "blanquet," and in the department of Lot et Garonne it makes its appearance in vineyards which are planted on oak clearings after about 20 years have elapsed. M. Millardet asserting that the effect upon the plant attacked is similar to that of the phylloxera. Perhaps the most important fact connected with this subject is the one stated by Dr. Behr at a previous meeting; viz., that the phylloxera disappears when brought in contact with this fungus. Some years ago M. Pasteur, in a communication to the phylloxera commission of France, predicted that a means of destroying the phylloxera by inoculation with a microscopic fungus might yet be discovered. When we take into consideration the fact that no plant or living thing has, for any length of time, dominated its fellows without receiving a check, we are prepared to receive the suggestion of Pasteur with respect. All of us are familiar with the *Saprolegnia ferax*, a fungus which destroys such vast numbers of flies during the autumn months; this is only one of many known fungoid pests which prevent the too rapid accumulation of any one species at the expense of its fellows. Another notable example is that of the partial destruction of a diptera, which was killed by a species of entomophthora, as described in a communication to the French Academy by Cornu.

Prof. Hagan, of Cambridge, Massachusetts, has recently suggested that the animal pests of our greenhouses might be destroyed by the free application of yeast, on the hypothesis that the animal might be inoculated with the spores, and so destroyed. Prof. Metschnikoff has succeeded in transmitting the "green muscardine" (isaria destructor) from one animal to another, and in so doing has proved its deadly character. Although we may not be able to furnish a remedy for this new vine pest, yet careful observations made upon the spot may lead to results of the greatest importance to us in dealing with the phylloxera.

**MELTING AND REFINING BULLION.**—Among those measures passed by Congress in its last session was an Act amending Sec. 3,524 of the Revised Statutes, by striking out the words "for melting and refining when bullion is below the standard," and inserting in lieu of these the words "for melting or refining bullion," making the section read as follows: The charges for converting standard silver into trade dollars, for melting or refining bullion, for toughening when metals are contained in it which render it unfit for coinage, for copper used for alloy when the bullion is above standard, for separating the gold and silver when these metals exist together in the bullion, and for the preparation of bars, shall be fixed from time to time by the Director, with the concurrence of the Secretary of the Treasury, so as to equal, but not exceed, in their judgment, the actual average cost to each mint and assay office of the material, labor, wastage and use of machinery employed in each of the cases aforementioned.

**NEW COIN FOR TWO MONTHS.**—The four United States mints made only 40 double eagles last month. There were none coined in January. The other coinage for February embraced \$4,064,600 in eagles, \$3,148,400 in half eagles, \$120 in three-dollar pieces, \$100 in quarter eagles, \$40 in gold dollars, \$2,307,000 in standard dollars, \$11,340 in three-cent pieces and \$25,700 in cents. In all there were 6,291,300 pieces of money coined in February, of a value of \$9,558,100. The coinage for all the mints for January and February, 1881, was as follows: Double eagles, \$800; eagles, \$7,529,930; half eagles, \$6,946,000; three dollars, \$120; quarter eagles, \$100; dollars, \$40; standard dollars, \$4,607,000; three cents, \$11,340; cents, \$55,000; total, \$19,150,330.

## Encouraging Mining Prospect.

There has been quite a stir of late in the mining interests of this vicinity, says the *Calaveras Chronicle*, and the prospects are very favorable for a lively season; in fact, there is evidently about to be another boom in quartz and gravel mining. There has been quite an influx of quartz and gravel operators, and the movement seems but just beginning. Unlike former movements of the kind, there is more earnestness manifested, and the parties visiting this locality are prosecuting their investigations in something like a business manner. Men of means are appearing in person; the inducements for investments are being carefully examined, and there are good reasons to believe that extensive enterprises will be undertaken. Candidly speaking, the mining prospect in this county has not looked so encouraging as it now does for many years. The prospecting fever has developed itself to such an extent as to awaken quite a lively interest.

That this county affords as fine a field for remunerative investments in mines as can be found anywhere, is unquestionable. Mining is not what it used to be. Making a fortune in a day is not by far so frequent occurrence as in former years. That time is past. Still, untold wealth remains locked within the bosoms of the mountains, but it requires pluck, perseverance and capital to make the earth yield its treasures. Heretofore many operations have been undertaken in this vicinity with a lack of judgment altogether unpardonable. Under the circumstances it is not surprising that the results have been failures. The effect has been to place this section of country in an unfavorable light to those who seek investment in mining property, and has been the means of retarding the development of the mineral resources of the county. But the time is fast approaching when the erroneous impression that the mineral resources of this section are exhausted will be entirely dispelled by the inauguration and prosecution of some of the biggest mining enterprises in the State. That time, too, is not far distant. The indications are strong and unmistakable, and any ordinary observer will recognize at once the certainty of numerous and extensive operations in the future, both in quartz and gravel mining. The movement is not confined to this locality alone, but the upper country gives signs of an awakening. Prospecting in that section is being carried on with the most flattering results, and there is no doubt in the world but that it will lead to the discovery of lasting and paying quartz mines. We are pleased to note the change for the better in the appearance of things, and we repeat it, that the future prospects for many years were never so encouraging as they are at the present time.

The people of Port Discovery are greatly excited over a slight gold discovery in their vicinity. The specimens of quartz forwarded to San Francisco some time since from that place assay only \$14 to the ton, but this has induced parties to start out on a mining expedition from which they expect great results.

## Business Directory.

WM. BARTLING. HENRY KIMBALL.  
**BARTLING & KIMBALL,**  
BOOKBINDERS,  
Paper Rulers & Blank Book Manufacturers  
505 Clay Street, (southwest corner Sansome),  
SAN FRANCISCO.

**JOHN A. CHURCH, E. M. PH. D.**  
MINING ENGINEER,  
Room 75, 115 Broadway, New York.  
Agent for PADDOCK'S Ore Dressing Machinery.  
Mining Machinery supplied.

**San Francisco Cordage Factory.**  
Established 1856.  
Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.  
Extra sizes and lengths made to order on short notice.  
**TUBBS & CO.,**  
611 and 613 Front Street, San Francisco

## New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DREW & CO., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. W. M. SLATER will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

## USEFUL BOOKS

Relating to Casting and Founding, Electricity, Electric Light, Engineering, Drawing, Manufacture of Gas, Heat, Indicator Diagram, Link Motion, Mechanics, Screw Cutting, Slide Valve, Steam Boilers, Steam Engines, Steel, Turning, Wire Gauge, Workshop Receipts. Descriptive Catalogue sent prompt on application.

E. & F. N. Spon, 446 Broome St., N. Y.

## MOREY &amp; SPERRY,

MANUFACTURERS OF

## Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

## IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one per hour of hard quartz that will pass through a 40-mesh screen. The wear is less in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C. No bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlo. Frying Furnaces, Etc., Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply. Iron Work complete for Wood Frames, also.

**SPERRY'S**  
WROUGHT IRON FRAME  
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

**MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.**

## GIANT POWDER

MANUFACTURED UNDER A NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.  
Stronger, Better and Safer than any other High Explosive

## Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

**BANDMANN, NIELSEN & CO.,**  
SAN FRANCISCO, CAL.

## LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1863.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for New Prices, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

**JAMES LEFFEL & CO.,** Springfield, Ohio,  
and 110 Liberty St., N. Y. City.

**PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.**

## STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequalled strength, toughness and durability. An invaluable substitute for forgings or cast-iron requiring three-fold strength. Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc. 15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings. CRANK SHAFTS, SHOES, DIES and GEARING specialties. Circulars and Price Lists free. Address

**CHESTER STEEL CASTING CO.,**  
Works, CHESTER, Pa. 407 Library St., PHILADELPHIA

## MECHANICS' MILLS.

OUR WELL KNOWN

## WATER TANKS,

Made by machinery, constantly on hand and made to order. PAN STAVES, WOOD PULRIES and OAK GUIDES a specialty.

**WELLS, RUSSELL & CO.,**  
Mechanics' Mills, corner Mission and Fremont street.

**J. H. WYTHE, M. D.**

Residence: 935 West Street, Oakland. Office: 759 Market St., San Francisco  
Before 10 A. M., after 5 P. M. From 11 A. M. to 3 P. M.

## THE IMPROVED INGERSOLL Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

**GEO. R. FOARD, SOLE AGENT,**  
No. 18, First St., S. F.

Send for a Catalogue.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by **DEWEY & CO.,** MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and Europe, and explains the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, appliances and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

## EXCELSIOR BLASTING POWDER

MANUFACTURED BY THE

Excelsior Powder Company.

This is no so-called "safety" Powder, but a powerful explosive, and as safe to handle and use as any nitro-glycerine Powder on the continent. There is no headache or nausea in the use of this Powder, as the noxious fumes are entirely done away with. It is put up in cartridges of any size to suit consumers and is exploded with cap and fuse, the same as any other high explosive. The following testimonial is a sample of hundreds of the same tenor being constantly received:

GOLD HILL, August 17, 1880.

AGENT EXCELSIOR POWDER CO.—Dear Sir:—I have used your Powder in test cement and hard blasting rock, and find it superior to any Powder in use on the Comstock. It does its work efficiently, and does not leave the person using it with a severe headache, like the other Powders so to the majority of miners. I am recommending it I would suggest, give it a fair trial and I am confident it will speak for itself. Wishing your Company success,  
I am respectfully yours, etc.,

GEORGE CLARK,

Foreman Sierra G. and S. M. Co.

Address all orders to

**Excelsior Powder Company,**  
Room 40, Merchants' Exchange,  
SAN FRANCISCO, CAL.

## AMERICAN EXCHANGE HOTEL.

Sansome Street, (Opposite Wells, Fargo & Co's Express), San Francisco.

This Hotel, under the management of CHAS. MONTGOMERY, has been thoroughly renovated, and being in the very center of all the Banks, Insurance Office and Commission Merchants, it offers special inducements to Merchants from the Interior and Farmers.

Board, with Room, \$1, \$1.25 and \$1.50 per day. Special rates by the week or month.

FREE COACH TO AND FROM THE HOTEL.

## Books for Miners and Millmen.

**KUSTEL'S CONCENTRATION OF ORES** (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequalled by any other published embracing the subjects treated. Post-paid, \$7.50. Printed and sold by Dewey & Co., S. F.

**AARON'S TESTING AND WORKING SILVER ORES**—Illustrated, 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, \$2. Published and sold by Dewey & Co., S. F.

**COPP'S HANDBOOK OF MINING LAWS**—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, \$1.00. Sold by Dewey & Co., S. F.

A New Edition.

**KUSTEL'S ROASTING OF GOLD AND SILVER ORES** (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. 1880. A valuable and carefully written work. Postpaid, \$3.00. Sold by Dewey & Co., S. F.

W. B. CHAMBERLAIN, JR.

T. A. ROBINSON.

Life Scholarships, \$70.

## Metallurgy and Ores.

**WM. D. JOHNSTON,**  
(Formerly Chief Assayer with Thos. Price.)  
**ASSAYER AND ANALYTICAL CHEMIST,**  
118 & 120 Hallock Street,  
Near Leidesdorf, SAN FRANCISCO.  
ASSAYING TAUGHT.

Personal attention insures Correct Returns.

**Nevada Metallurgical Works,**  
No. 23 STEVENSON STREET,  
Near First and Market Streets, S. F.  
ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores Worked by any Process.  
Ores Sampled.  
Assaying in all its Branches.  
Analyses of Ores, Minerals, Waters, Etc.  
Working Tests (Practical) Made.  
Plans and Specifications furnished for the most suitable process for working Ores.  
Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO.,  
(Formerly Huhn & Luckhardt.)  
Mining Engineers and Metallurgists

## JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

**ASSAYERS' MATERIALS,**  
**MINE and MILL SUPPLIES,**

**CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.**

118 and 120 Market Street, and 15 and 17  
California St., San Francisco.

We would call the attention of Assayers, Chemists,  
Mining Companies, Milling Companies, Prospectors, etc.,  
to our full stock of Balances, Furnaces, Muffles, Crucibles,  
Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast, we feel  
confident from our experience we can well suit the demand  
for these goods both as to quality and price. Our  
New Illustrated Catalogue, with prices, will be sent on  
application.

Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application. Agents for the Patent  
Plumbago Crucible Co., London, England.

JOHN TAYLOR & CO.

## A Card from Architects.

**The California Architect and  
Building Review.**

Office, No. 240 Montgomery Street, San Francisco, Cal.  
It is with pleasure that we publish the following from  
prominent Architects in this city:

Believing that a journal of its kind is a necessity on this  
coast, and judging from what has appeared in the "Quarterly  
Architectural Review," we are led to believe that the  
CALIFORNIA ARCHITECT AND BUILDING REVIEW  
will be worthy of generous support and encouragement. We  
therefore pledge our cordial sympathies, personally, and hope  
that the enterprise will receive kindly recognition and liberal  
support from all Architects and Builders and the public gener-  
ally. (Signed) David Farquharson, Wright & Saunders, S.  
H. Williams, Thos. J. Welsh, P. Huerns, John Marquis, E.  
McDougal & Son, Wm. Mosser, Wm. Curlett, Meeker &  
Banks, W. O. Hoagland, S. & J. Newsom, B. Henriekson

## LEACHING

**Gold and Silver Ores,**

By C. H. AARON.

The most complete Hand-book on the subject extant  
164 pages octavo.  
Illustrated by 12 Lithographic Engravings and Four  
Woodcuts.  
Fully indexed. Plainly written for practical men.  
In cloth, \$3.00. Sold by

## REMOVAL.

## JUSTINIAN CAIRE,

IMPORTER AND DEALER IN

Assayers Materials, Chemicals  
AND MILL SUPPLIES.

Brass and Steel Wire Screens, Hardware and Fancy

Goods, Opera, Field and Marine Glasses,

Optical Instruments, Etc.

Nos. 521 and 523 MARKET STREET, S. F.

The attention of Assayers, Chemists, Mining and Milling  
Companies is particularly called to the complete stock of  
Balances, Furnaces, Crucibles, Brass and Steel Wire  
Screens, etc., including all the necessities for Assayers  
and Miners, as also for Milling men. An experience of 30  
years in this line of business enables me to guarantee a  
strict attendance to the orders which my friends may en-  
trust to me. Gold and Silver Tables and a full list of ar-  
ticles to be found in my store, to be had on application.

Patent Mill and Street Lamps to Burn Coal  
Oil, Naphtha and Gas.

## BOESCH'S PATENT

Hydraulic Mining and Locomotive Head Lights, with the  
Latest Improvements, making them the best and  
cheapest in the market.

Pacific Lamp and Reflector Factory.

589 Mission Street, San Francisco.

## Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT  
for DIAMOND POINTED DRILLS, now brought to the  
highest state of perfection, are prepared to fill orders  
for the IMPROVED PROSPECTING AND TUNNELING  
DRILLS, with or without power, at short notice, and  
at reduced prices. Abundant testimony furnished of  
the great economy and successful working of numerous  
machines in operation in the quartz and gravel mines  
on this coast. Circulars forwarded, and full infor-  
mation given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 68.

## SAVE YOUR GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me  
from 500 pounds to a ton of their ores, that I can save  
from 25 to 100 per cent. more than any other machinery  
now in use. I will make no charge.

Machinery can be seen in operation every day at  
No. 143 Fremont Street.

M. B. DODGE.

## BOILER COVERINGS.

Plastic Cement and Hair Felt, with or without the Patent  
"AIR SPACE" Method. Cement ready for use by the barrel.

G. C. FOWLER, No. 413 Pacific St., S. F.

## W. N. LOCKINGTON,

520 FIFTH ST., cor. Bryant, San Francisco.  
Assaying and Amalgamating, Ores Tested.  
Jewelers' Sweeps Worked.

## AGENTS AND INVENTIONS.

### List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING FEBRUARY 22d, 1881.

238,050.—AMALGAMATOR.—P. Plans, S. F.  
238,194.—CONVEYOR.—W. Winterhalter, S. F.

FOR THE WEEK ENDING MARCH 1st, 1881.

238,224.—HOSE COUPLING.—D. B. Kendall, Howland Flat, Cal.  
238,300.—FAUCET.—H. Mattallath, S. F.  
238,314.—VOTING MACHINE.—A. M. Stephens, Los Angeles, Cal.  
238,455.—FURNACE.—C. Stetefeldt, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### The World's Fair—The New Hitch.

The unfortunate disagreement among the original executive committees of the proposed New York World's Fair, which was finally adjusted, seems to have been speedily followed by another irritating question, incidentally introduced by Gen. Grant, who undoubtedly had no idea of this commotion which his words would cause. It appears that the General was much exercised over the feeling engendered in certain quarters by the substitution of "Inwood" instead of the Central Park as the place for holding the exposition. Many who had promised large contributions were fearful that if the grounds were selected at so great a distance—12 miles north of the Battery—that the attendance would be so much less than at the Park that the exposition would be a financial failure, and for that reason were disinclined to come down with the promised amounts. For this reason the General advised that another effort should be made to secure a location in the Park. He is reported, in an interview with a newspaper reporter, to have advised this new application "because this people of New York seem to be indifferent to a fair held at Inwood."

In urging this proposition, he suggests several radical measures, such as the inclosure of the Museum of Natural History building in Manhattan Square; also of the Metropolitan Museum of Art building, soon to be completed, as well as 60 acres of the Park, known as North Meadows, on which another permanent building may possibly be erected. A temporary railway through Eighty-fifth street, he thinks, connecting the three enclosures, would make a very neat arrangement, providing all needed facilities, and the Park proper would be preserved from injury. But just here the Park Commissioners are liable to differ. In fact, to make much advance in that direction may take "all summer," and more too. If the election of Gen. Grant to the presidency of this Fair Commission incidentally raises the questions here involved, some of the members may conclude that they have "caught a tartar." In any case, the conflict of opinions, if any conclusion is reached before Gen. Grant's departure, must be short, sharp and decisive. He is further reported as saying: "All that is done must be done soon. The next few weeks will determine whether an international exhibition is to be held in New York in 1883. A change in the feeling of the people must take place soon or the project must be abandoned. When I was chosen President of the Commission I said that I could give little attention to its work for several months on account of my expected absence, but next year I might be able to do more. I relied upon others to raise the funds and organize the work. If the people who wish the fair to be held at Inwood will come forward and subscribe for the stock, let them do it now. If they will not, then something must be done to interest the people at large, so that they will subscribe. Whatever is done needs to be done at once." But notwithstanding the people of New York are so very sensitive on the subject of "park desecrating," it is said that Gen. Grant has yet full faith in the coming exhibition; though Chicago may stand ready to take it off the hands of New York, as has been intimated, guaranteeing a complete success, he believes that there is every prospect of a greater exhibition than the world has ever seen if New York rises to grapple with the opportunity.

**A ZEALOUS PROSPECTOR.**—A German assayer recently came to the ranch of James Bagget, in the vicinity of Newhall, Los Angeles Co., having been three days in the mountains without food. This zeal for prospecting came near being fatal to him, as he was completely lost. He remained several days to recuperate and then started again, leaving a case containing an assayer's complete outfit. He has never called for them since and it is hard to tell what finally became of the unfortunate man.

**VICTORIOUS BODIE.**—The jury in the case of the Jupiter mining company against the Bodie Consolidated mining company, in the United States District Court, returned a verdict for defendant. The case has been on trial for some weeks. After three hours' deliberation the jury returned a verdict as above.

### Glove Manufacture in San Francisco.

There is a smack of historic lore attached to one of the manufacturing establishments of San Francisco of which our citizens may not be wholly aware. Mr. Fred. H. Busby, the glove manufacturer, 412 Market street, informs us that the business of glove making was carried on by his ancestors no less than 200 years ago, and from that time to the present several members of the family have been so actively engaged in this pursuit that the name has been identified without interruption with the business. About the year 1680, during the reign of Charles II., surnamed the "Merry Monarch," the cotemporary and successor of Oliver Cromwell, the Busby glove making business was established in the city of Oxford, county of Oxford, England. From time to time, during the intervening years, branch establishments, emanating from the Oxford house, have been established in various cities of Europe and the United States. Mr. Fred. H. Busby commenced the manufacture of gloves in San Francisco in the year 1874, and from that time on the business has made such rapid strides that his present spacious factory is not adequate to the demand. In consequence of this he is about to erect a three-story brick building on a large lot already selected for this purpose. This will be used for a factory, while the premises now occupied will be devoted exclusively to the purposes of showrooms, etc. Continued improvements in this manufacture of gloves have characterized Mr. Busby's career in this city; scarcely a month passing without something new being offered to his customers, which only tend to enhance his already well known reputation as master of the glove trade. That his gloves never rip he attaches mainly to the fact that they are hand sewed and "double welted," a device used exclusively by him, and for which he has been granted a United States patent. Mr. Busby claims that he can today dispose of this patent to a New York firm for a sum sufficient to render him independent of the glove business, but he avers that such is his old love for the trade that he could not exist away from the smell of a genuine buckskin.

The styles of goods made at this house embrace every variety, from the finest ladies' kid of many buttons to the heavy copper riveted mittens of California fame, all of which are driving Eastern goods completely out of this market, chiefly from the fact that the latter are wholly machine sewed. Another notable fact is the difference in the Eastern and Californian methods of tanning the hides used. The Eastern method is said to puff up the skin to such an extent that finished leather of one-eighth of an inch in thickness would scarcely be one-sixteenth of an inch thick if tanned by the Californian process. Consequently, California buckskin of a given thickness would be twice as durable as the Eastern tanned article.

During the busiest season there are between 50 and 60 men and girls employed in the factory, and experienced hands are in constant demand at good wages. Girls' wages range from \$9 to \$20 per week. The cutting is done by men who work by the piece; cutters of heavy goods receiving from \$20 to \$27 per week; and cutters of fine work from \$30 to \$45. Mr. Busby gets his buckskins from every State and Territory on the Pacific coast, British Columbia, Mexico, South and Central America. He has recently sent an order to a Sydney firm for a regular monthly supply of kangaroo hides, which his experience proves to be desirable for glove making. He also manufactures genuine dog skin gloves, the skins for which he secures by contract from this city, Oakland and Sacramento. The whole number of dog skins used amounts to from 300 to 450 per month, this being the only establishment in the United States where real dog skin gloves are made to any considerable extent. Calf skins and goat skins are obtained in this vicinity. Mr. Busby has recently been experimenting with ground squirrel and gopher skins with very flattering results. He expects to use these as a lining for heavy winter goods, and as a covering for blanket and cloth goods, of which he makes a great variety. It will be seen at a glance that "home industry" is the motto of this establishment. From the buying of the raw material to the payment of the humblest employee, "live and let live" is the principle which actuates this establishment.

The ore body in the Ontario mine is said to be 1,500 ft. long. It is claimed that \$300,000 will be expended on the works this year in developments and improvements. The monthly expenses of mine and mill average \$60,000, and there is \$50,000 paid to stockholders every month. Despite these facts, the production has been large enough to meet these requirements, and add materially to the reserve fund. The shaft is now down 800 ft., where the largest station yet made has been cut out. An immense Cornish pump is now being constructed at the East for this station. This will have a hoisting capacity for 2,000 ft. The vein on the 700 level will be cut through the 800 level by stoping. The Park City Record, from which these facts are gathered, intimates that a new mill will also be erected this year, for which there are both funds and ore.

The San Francisco copper mine at Spenceville, Nevada county, is yielding 40 tons copper cement per month. It is expected that this will soon be increased to 60 tons per month.

### News in Brief.

RED BLUFF had an oldfashioned lightening and thunder storm on the 9th inst.

MR. KEOGH started from Los Angeles last Thursday with 19,500 sheep for Utah.

THERE are 1,808 more males than females in Walla Walla county, Washington Territory.

A NEW YORK dispatch relates that Mrs. Mackay is going to quit Paris to reside in New York.

UTAH potatoes are being shipped in large quantities to Colorado, where they find a ready market.

TWENTY THOUSAND cans are made each day at Hume's cannery. This is the best work on record around Astoria.

GRASS VALLEY will have more mines working this summer than for years past. The whole outlook of the district is favorable.

The steamer *James Howard*, belonging to the New Orleans Anchor line, was burned at St. Louis Sunday evening; loss \$75,000.

GENERAL UPTON, the well known author of Upton's military tactics, committed suicide at the Presidio, in this city, on Tuesday.

THERE is a scarcity of laboring men all over Puget Sound; 40 loggers could now get employment in the vicinity of Olympia, W. T.

THE *Tribune* says the collectors of this World's Fair Commission report that conditional and unconditional subscriptions aggregate \$900,000.

THE Oregon Railway & Navigation Co. are reported to have bought up the majority of this stock of the Northern Pacific R. R. Co., so that they will control that road.

THE Governor's message calling an extra session will be made public next week. It specifies the apportionment and appropriation bills, the tax levy and amendments to the Constitution.

### Ore Feeders.

EDITORS PRESS:—My attention has been called to an article which appeared in your issue of the 12th inst., entitled "The New Mill Furnace and Lixiviating Works for the Rosario Mining Company, Mexico."

The entire tenor of that article is to the effect and seems to be intended to convey this impression that all of the appliances and machinery furnished under the contract with Messrs. Parke & Lacy are of the most approved standard patterns, and that this mill when erected will be the model silver mill of the Pacific coast.

I cannot, however, believe that such will be the result, as I find enumerated as a portion of the equipment, eight "Climax" ore feeders, and since automatic ore feeders are recognized as an important and essential factor, ensuring the regular, proper and economical reduction of ores, and effecting the crushing of 20% more ore with 15% less wear of iron than by hand feeding; and as it is a well determined fact that feeders of this "Climax" pattern do not fulfill the requirements of a first-class standard feeder, I cannot admit that they are a proper adjunct to contribute towards a model mill; for it is well known among intelligent mining men that the "Climax" feeders have never yet been run successfully in any mill on this coast; and Messrs. Parke & Lacy ought also to have been cognizant of this fact since they have been offered \$50 to show one of them in successful, practical working operation anywhere, and have failed so to do. In substantiation of the assertion that they are not up to the required standard, comes the simple fact, that not more than 40 of them have been manufactured since the issuance of the patent, and, in nearly every case where they have been unfortunately adopted they have after a fair trial been discarded; whereas there have been over 800 "Challenge" ore-feeders manufactured by Joshua Hendy, of this city, which have been fitted in all of the best appointed quartz mills in the United States and elsewhere, and have always, and are now giving perfect satisfaction wherever used, and have in many cases superseded other patterns, which, not answering the requirements of perfect automatic feeders, have been rejected.

R. B. NOYES.

San Francisco, March 11, 1881.

### Quinine and Arsenic

Form the basis of many of the *Ague* Remedies in the market, and are the last resort of physicians and people who know no better medicine to employ for this distressing complaint. The effects of either of these drugs are destructive to the system, producing headache, intestinal disorders, vertigo, dizziness, ringing in the ears, and depression of the constitutional health. AYER'S *AGUE CURE* is a vegetable discovery, containing neither quinine, arsenic, nor any deleterious ingredient, and is an infallible and rapid cure for every form of Fever and Ague. Its effects are permanent and certain, and no injury can result from its use. Besides being a positive cure for Fever and ague in all its forms, it is also a superior remedy for Liver Complaints. It is an excellent tonic and preventive as well as cure, of all complaints peculiar to malarious marshy and miasmatic districts. By direct action on the liver and biliary apparatus, it stimulates the system to a vigorous, healthy condition.

FOR SALE BY ALL DEALERS

IMPORTANT additions are being continually made in Woodward's Gardens. The grove walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their notions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

### Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St. S. F.

The State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

### DIVIDEND NOTICE.

And in accordance with law, and an order of the Board of Directors, made on the second day of February, 1881, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the Auction Rooms of John Middleton & Son, No. 116 Montgomery St., San Francisco, Cal., Monday, the 28th day of March, 1881, at the hour of 2 o'clock, P. M., of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

GEO. R. SPINNEY, S. C.

Office - Room No. 44, No. 314 Pine St., San Francisco, California.

## INCERSOLL ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

## MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX,  
49 Fremont St., S. F.

### NOTICE.

TO ALL WHOM IT MAY CONCERN:

Notice is hereby given that George Denton Cardow is no longer a Director of the Isabelle Gold and Silver Mining Company of London, England, Limited, and that any Power of Attorney which he may have had from said Company was invalid, for the reasons set forth in the following Resolutions:

1. Resolved, that as the Power of Attorney given to Mr. Geo. Denton Cardow on the 24th of August last, was not duly authorized, and the seal of the Company was affixed thereto without the authority of a duly constituted Board of Directors, the Directors of the Company hereby repudiate all acts and things done, or caused to be done by Mr. G. D. Cardow, under or by virtue of such Power of Attorney, and that by way of caution the Directors of the Company do rescind the said Power of Attorney, but without in any way recognizing the validity of such Power of Attorney, and such Power of Attorney is hereby rescinded accordingly; and that the solicitor of the Company inform Mr. G. D. Cardow of this Resolution, and request him to return to the office of the Company, the said Power of Attorney.

2. Resolved, that the Solicitor do forward a copy of the last Resolution to Mr. Lewis Chalmers, the Manager at the Mines, and request him to advertise in such papers in California as he may think necessary, the said Resolution, or the purport thereof; and also the fact of Mr. G. D. Cardow having resigned the office of Director of the Company.

By order of the Directors, LEWIS CHALMERS, Manager.

PATENT DETACHABLE TOOTH SAWS,  
Manufactory, 17 & 19 Fremont St., S. F.

# "THE \$1,000 CHALLENGE"

## Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.  
Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others:

Roughly.....	20	Stamp.....	Yuba county, Cal.
Sheep Ranch.....	20	".....	Calaveras "
Mahoney.....	43	".....	Amador "
Zelle.....	49	".....	" "
Placerville.....	41	".....	El Dorado "

Omaha.....	30	".....	" "
Green Mountain.....	50	".....	Phimas "
Phimas-Eureka.....	60	".....	" "
Bulwer-Standard.....	30	".....	Bodie Dis. Mono. "
Standard.....	20	".....	" "
Noonday.....	30	".....	" "
Bodie.....	40	".....	" "
Christy.....	5	".....	Utah Co., Utah.
Ontario.....	40	".....	Parley's Park "
Contention.....	20	".....	Tombs' one Dis, Arizona
Grand Central.....	20	".....	" "
Harshaw.....	20	".....	Patagonia, "
Sunshine.....	20	".....	Idaho Springs, Col.
Homestead.....	20	".....	Black Hills, Dakota.
Hidden Treasure.....	40	".....	" "

### Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks a trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King" Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Kennedy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

Mr. H. W. GREENWELL, of the Tingen Mine, El Dorado Co., or any other person can make \$4,000 by disproving the acknowledged superiority of my "CHALLENGE" Feeder, in a competitive trial, side by side, with any other Feeder, on wet or sticky ore from any mine, and I will give \$100 to any one who will procure the acceptance of this challenge, and arrange for a fair and impartial test on merit.

I mean business, Gentlemen, "either put up or shut up."

## JOSHUA HENDY,

Manufacturer of all descriptions of Quartz and Saw Mill Machinery. A Large Stock of both New and Second Hand at Machine Works. Nos. 49 and 51 Fremont Street, San Francisco.

Agent for "BAKERS" Rotary Pressure Blowers.

The Undersigned are Agents for, and are Prepared to Furnish Prices and all Particulars for

THE BALDWIN LOCOMOTIVES, every style and for any service.

THE BALDWIN STEAM MOTOR for use on City and Suburban Roads.

FREIGHT CARS,

PASSENGER CARS,

From BILLEMAYER & SMALL CO., and J. M. JONES & CO.

202 Market Street, San Francisco

RICHARD C. REMMEY, Agent,

Philadelphia Chemical Stoneware Manufactory.

1100 E Cumberland St., Philadelphia, Pa.

Manufacturer of all kinds of Chemical Stone Ware for Manufacturing Chemists. Also, Chemical Bricks for Glover Towers.

AIR COMPRESSORS  
PRICES REDUCED. SEND FOR NEW CATALOGUE.  
CLAYTON STEAM PUMP WORKS  
14 AND 16 WATER STREET, BROOKLYN, N. Y.

## Mining & Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our homes inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free. Address.

DEWEY & CO.,

202 Sansome St., N. E. Cor. Pine, San Francisco.

## LAND

Good land that will raise a crop every year. Over 14,000 acres for sale in lots to suit. Climate healthy. No drouths, had floods, nor malaria. Wood and water convenient. U. S. Title, perfect. Send stamp for illustrated circular, to EDWARD FRISBIE, Proprietor of Reading Ranch, Anderson, Shasta County, Cal.

### A NEW TREATMENT

Consumption, Asthma, Bronchitis, Dyspepsia, Catarrh, Headache, Neuralgia, Debility, Rheumatism, And all CHRONIC and NERVOUS DISEASES.

PACKAGE CONVENIENTLY SENT BY EXPRESS, READY FOR USE

### AT HOME.

A Treatise on Compound Oxygen, giving the history of this new discovery, and a large record of most remarkable cures, will be mailed free to all who ask for it. Also, "Health and Life," a quarterly journal, containing much interesting information. Write for it. Address the proprietors, DR. STARKEY & PALEN, 1109 and 1111 Grand street, Philadelphia, Pa., or H. E. MATHEWS, 608 Montgomery street, San Francisco, Cal., from whom can be procured both information and supplies.

## Mining & Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers.

202 Sansome St., S. F.

## Iron and Machine Works.

### SACRAMENTO BOILER WORKS,

214 & 216 BEALE St. (rear of Etna Foundry),

J. V. HALL,

PRACTICAL BOILER MAKER.

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the lowest possible terms.

### UNION IRON WORKS,

HERCULES SLAYING THE GIANTS.

# HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

**No. 1 (XX) is the Strongest Explosive Known.**  
**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE.

ST. LOUIS, MISSOURI,  
Nos. 811 to 819 North Second Street.

## HYDRAULIC GRAVEL ELEVATORS,

For working flat  
gravel mines that  
have no dump.

Sluices gravel and  
water up hill on an  
angle of 45°, and  
will run any kind of  
gravel that will run  
in a flume. Handles  
rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume  
on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the  
process of mining the same as any other hydraulic mine. Is now a practical success in various  
places in California and Oregon. Send for descriptive circular to

**JOSHUA HENDY,**

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

### Mining Books.

Orders for Mining and Scientific Books in general will  
be supplied through this office at published rates.

## \$1,000 CHALLENGE!

### THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial  
Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from  
the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power  
required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend  
to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of  
\$1,000 each, and we mean business.

ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

### "FRUE" ORE CONCENTRATORS.

I have on hand and for sale, at LOW PRICES, a number of the above Concentrators, of the latest pattern,  
and in perfect order.

**JOSHUA HENDY,**

Manufacturer of Quartz and Saw Mill Machinery

AGENT FOR "BAKER'S" ROTARY PRESSURE BLOWERS,

Hot Polished Shafting from the Akron Iron Company, Ohio. Also, "P. Blaisdell & Co.'s" Machinery Tools.

A Large Stock of New and Second hand Machinery at Machine Works.

Nos. 49 and 51 Fremont Street, San Francisco.

## COAL!

NOW DISCHARGING.

2,500 TONS Atlantic Cumberland,  
EX ST. JOHN.  
2,500 TONS Cowpen West Hartley,  
EX OCEAN KING and WALLACETOWN.  
1,500 TONS Hamilton Scotch Splint,  
EX DELHANNA.  
1,500 TONS Wallsend Sydney,  
EX BEEMAH.

For Sale at Lowest Market Rates.

**J. MACDONOUGH,**  
41 Market Street, S. F.

## PEBBLE SPECTACLES.

Muller's Optical Depot,

135 Montgomery St., near Bush.

**SPECIALTY FOR 30 YEARS.**

WHOLESALE AND RETAIL.

The most complicated cases of defect-  
ive vision thoroughly diagnosed, free of  
charge. Compound Astigmatic Lenses  
Mounted to order, 24 hours notice.

This paper is printed with ink furnished by  
Chas. Enou Johnson & Co., 509 South 10th  
St., Philadelphia & 59 Gold St., N. Y. Agent  
for Pacific Coast—Joseph H. Dorety, 527

Publishers.

SAN FRANCISCO, SATURDAY, MARCH 26, 1881.

VOLUME XLII  
Number 13.

## California Mines.

An impression seems to prevail to some extent that because other sections of country are prosperous in mining matters, and people are leaving California for those sections, California mining matters must be at a standstill. This is by no means the case. California mining is now being conducted on a more substantial basis than ever before. While there have been no great excitements, no special advertising and no great stir over the mines of this State, they have been, and are, doing well and generally paying their owners.

Until Bodis came to the front there were very few California mines called on the Stock Board, but at that time a number were put on the lists. On the decline of stock gambling it was generally supposed by those with only a superficial knowledge of the matter, that the California mines felt the result to their detriment. This is not so. The stock market had very little effect on California mining, for the reason that our mines were not favorites to deal in, with the exception of a few of the Bodis. The great mining counties of the State were, some of them, not represented on the Board by a single mine.

Up in the mountains where mining is carried on, work is progressing steadily at the various mines. The owners attend to their business and work away without much reference to outside influences. The owners are seldom heard of. Nothing is telegraphed about properties unless stock is to be sold. As most of the mines of this State are not stock jobbing enterprises, we do not hear of their being heralded abroad as bonanzas.

As an illustration of how mining matters are going on in this State we may quote the following paragraph from the Nevada Transcript, published in Nevada county, the most prominent mining county in the State.

"Every indication points to the fact that we are to have a lively mining season, and perhaps one which will excel all others in the past. There are more hydraulic mines in operation than there have been in a great many years, and their clean-ups thus far have been larger than usual. The Hirschman claim is the only one not in operation. The quartz prospects here were never better than they are now. There are more first-class claims in operation than ever before, and a larger number of good claims whose prospects are exceedingly flattering, to say the least. Before many months there will be sixty new stamps added to the already large number in this district. This of itself will give work to two or three hundred more men, and should bring renewed prosperity. There will be, before the year closes, twenty new stamps erected at the Murbie, a new twenty-stamp mill at the Mount Auburn, and twenty more stamps added to the Merrifield, making sixty in all, as far as heard from."

We do wish some of the New Mexican papers would stop telling us about the funding bill and the cabinet, and give us some more information about their mines. A great many people are looking in that direction for mining properties, and think of going to New Mexico to settle. The politicians interested in the other questions are more probably looking toward Washington.

## Walker's Compound Steam Pump.

This pump is the invention of Mr. Wm. Walker, an eminent British engineer, and though largely in use abroad and in the Eastern States has only of late been introduced into this market, with a full variety of styles and sizes. Messrs. Rankin, Brayton & Co., of the Pacific Iron works, having perfected an arrangement for manufacturing here, now offer them to the trade of this coast as essentially a home production, and as a valuable contribution to this important class of machinery.

The great saving of steam, and consequently of fuel as developed in compound engines, is now too, well known throughout the mechanical world to need more than a reference. This,

WALKER'S COMPOUND STEAM PUMP.

however, is the first time such an application has ever been made to a pumping engine. The inventor has happily embodied in one steam cylinder this important principle, in such a simple and cheap form that these compound cylinder pumps can be furnished at a less price than pumps of ordinary construction with a guarantee of a saving in running expenses of from 30 to 40%.

This high pressure and expansion are both carried on simultaneously throughout the entire stroke, thereby maintaining a more uniform aggregate piston pressure to the end of the stroke than would be possible with high pressure and expansion in one chamber, and yet giving a slightly reduced speed at the end of the stroke that facilitates the quiet closing of the pump valves.

The steam, having performed its work in the high pressure space, is afterward expanded, thereby extracting all the power possible from it, and effecting an enormous saving in fuel, as compared with ordinary high pressure direct acting steam pumps.

They deliver a constant stream, work noiselessly and without friction, with either steam or compressed air, and are made to force water to any desired height.

They are specially recommended for mining purposes on account of their economy of steam, general simplicity of construction, strength and durability.

All pumps are thoroughly tested under steam before leaving the works, and are guaranteed to give full satisfaction.

MINERS QUARRELS AT NORTONVILLE.—From reports received from Nortonville, it appears that a feud has long existed between the miners of Italian birth and those of other nationalities, principally Welsh, employed at the Black Diamond coal mines. National prejudices and jealousies and strong drink are at the bottom of it. This long standing feud has frequently culminated in street and pot-house broils. Lately a number of miners came to Nortonville from the Nanaimo, British Columbia mines. Since their advent the feud has been intensified, and the ordinary peaceful and quiet town of Nortonville has been frequently turned into a scene of turbulence and drunken conflicts. Last Saturday evening the hostile gangs indulged in frequent potations and near the hour of midnight, when well primed with bad whisky, paraded the street and finally met. The meeting was the signal for an immediate renewal of hostilities.

## The Bi-Chloride Process.

An item has been going the rounds of the press to the effect that a Frenchman named Designolles has invented an apparatus or process for working gold ores, the principal feature of which is the use of bi-chloride of mercury for amalgamation instead of the pure metal. This bi-chloride is, in solution, mixed with the ore, and in this state it is said that amalgamation is more perfectly accomplished than by the ordinary processes in vogue.

This discovery was first announced some two years since, but although it makes a very pretty laboratory experiment there is no probability of its answering in practice in a large way. A gentleman writes from France to the London Mining Journal, and describes the experiments he

saw made by M. Designolles, but declares they were unsatisfactory. So far as the apparatus was concerned he saw nothing whatever new, for the cast iron barrel on a horizontal shaft, with its iron balls and circular convex and concave copper plates of about two and one-half ft. in diameter, on a vertical shaft underneath the barrel, and on next floor were quite familiar appliances. The experimental trial was altogether unsatisfactory, because he did not see, and was not even told, how much gold dust had been mixed with the already crushed quartz; neither was he informed how much of the latter was placed in the barrel, or what quantity of the bi-chloride of mercury had been used with it in the operation, which continued for 10 or 15 minutes. At the conclusion he saw but little—a few minute globules of quicksilver on one copper plate and a trace of what was stated to be gold. This gentleman came away disappointed, and concludes as follows: It may be a

pleasing and interesting experiment in the laboratory and as a novelty, but of no practical utility, for the mine has yet to be discovered rich enough in gold to afford the immense expense of the Designolles process. Bi-chloride of mercury by this process is worth 4s. or 5s., and this quantity would be equal to about a good quart of the saturated solution approximately. Imagine, then, only one ton of crushed quartz subjected to this treatment, and that every grain of it must be in direct contact with the bi-chloride solution for a complete operation, and then consider how many quarts it would require to wet or saturate the one ton. Then, too, if crushing 50 or 100 tons every 24 hours, consider also the immense quantity of bi-chloride solution, and its subsequent treatment and expense. To me it appears preposterous in the extreme. The idea of using such a costly agent to extract, say one-half, or even one or two ounces of fine gold dust from 3240 lbs. or one ton of quartz. If the few pennyweights of gold per ton could be concentrated by an economical, speedy and effective process, so as to reduce the ton of crushed quartz to a very few pounds, then the bi-chloride solution might be profitably used.

AN ACRE OF LEAD.—On the yard directly west of the Richmond company's refinery, says the Eureka Sentinel, is a stack of lead which has been accumulating for a long time. Our Sentinel reporter computed the weight of the mass at 93,400 tons. It covers an area of 130 by 60 ft., and is piled to a height of seven ft. in some places.

ANTELOPE MINE.—Capt. Griffin to-day sent out a Dodge concentrator to the Antelope mine in Long valley. A true concentrator is already there. The Captain hopes to have the machinery all in place and the mill running again in two weeks. Eighteen men are at work in and about the mine, and there are over 800 tons of ore on the dump.—Reno Gazette.

A NEW YORK mining paper copying from an Arizona paper the statement that a certain mine had been relocated, gravely asks: "Will not our contemporary tell us what becomes of the share of the old Isabella company under this relocation?" As far as the stock is concerned it may be kept as a memento, as it will be as good for that as for any thing else.

## Sawyer's Bar.

A correspondent of the *Del Norte Record*, writing from Sawyer's Bar, says: On Monday last I got aboard a mule and started for the Last Chance country on a small creek emptying into the south fork of the Salmon river, and known as the Niggerville creek. On this gulch we last summer discovered some of the richest quartz lodes ever found in this vicinity. The owners are Meere, English, Doran and Grant. Their quartz is very rich and they have plenty of it. They intend putting in an engine next summer, which will enable them to run the mine during the entire year. A few hundred yards further up the creek is another location called the Enterprise, owned by Messrs. Henry Quinn, James Nalley, and others. They have done considerable work, building and prospecting, and are confident that they have a bonanza. Two or three hundred yards up the mountain side, above the Enterprise mine, is located another ledge, called the Columbia, and owned by Messrs. Hutchinson and Knapp. The proprietors are sure that they have all they want to make them both millionaires, and they certainly have rich quartz, together with energy and muscle to put it through. About one mile up the creek from the Last Chance mill is another lode, called the Gratten, owned by Messrs. Quinn, Patton, and Cunningham. As far as I am able to judge, they have as good a prospect as anyone on the creek; two ft. of fine looking quartz which they think will pay \$100 per ton. They will build a mill in the spring, if the present prospects hold good. Here are four quartz ledges within one mile of each other all prospecting well and having every indication of permanency. These discoveries have had a good effect on all branches of business here; encouraging prospectors and others to renewed exertions and efforts to secure claims for themselves. A new trail is now being constructed from the Last Chance locality to this place, which will shorten the distance from 10 miles to 7 and will be a better trail. So much for the new quartz mines.

## Chiricahua Mountains.

A correspondent of the *Arizona Mining Journal*, writing from Fort Boise, Arizona, says: This place is the center of a large mining country. It is situated in the midst of the Chiricahua mountains, at Apache pass, which at one time was the stronghold of the Apaches. In the rear of the fort is a gold mine, which several years ago was worked to advantage—but in 1869 the owner, Colonel Stone, and six men were killed in the Dragoon pass by the Indians, on their way to Tucson with a large amount of gold, the product of their mine. Since then it has not been worked and has been relocated by others.

To the west about 12 miles is the "Doe Cabezas" mining camp, which is being developed. The mills are at work testing several of the rich veins.

To the east of us is the California district, which is in its infancy, but many fine developments have been made; among them is the Texas and the Dan mine.

About eight miles from the fort, east, some fine ore has been found in Josephine mine. It has been mined for \$24,000.

To the north of them, there have been some very rich locations made, of smelting ores, galena, which assays into the hundred, and plenty of it, the great point, and easily got at, with plenty of wood and water. In fact all around us, gold, silver and copper have been found in great abundance, and it only requires capital and time to make this one of the richest mining sections of the Territory.

I have been from camp Apache, north, to the Mexican boundary, in the Chiricahua range, and in the district section.

The copper vein extends from Bisbee over to camp Rucker, through Swisshelm district, thence west in this range.

**A SMELTER INVENTION.**—Superintendent A. Arents is the inventor of a very necessary contrivance for use in connection with lead furnaces used in smelters. This invention is a syphon tap, through which the liquid bullion runs up hill into a basin at the top of the tube. Nearly all smelters use this convenient and simple apparatus, and for its use a royalty of \$1,000 per year is allowed Mr. Arents. The Grant smelting works of Leadville have nine of them in use, which they claim are different in some particulars from the Arents patent, and consequently refuse to allow the royalty, but a suit is pending in which the courts will decide whether or no the royalty shall be paid the inventor. The mode of relieving the furnaces of the mineral heretofore was to allow it to run out at an aperture made in the bottom of the furnace, but much of the slag would be allowed to come with the molten mineral, and was a great inconvenience in refining. —*Robinson Tribune*.

**THE PAINS OF HIGH STATION.**—Virginia Chronicle: "It's all right to say that George Washington never told a lie," remarked a thoughtful mining superintendent to-day. "I don't say he did; but he lived in a time when that wasn't hard for a man to accomplish. If George was alive now and running my mine and had to write a weekly letter reporting progress, I'm inclined to think he'd wrap crumpled his little hatched and put it away where the historian of the future wouldn't be likely to find it."

## Mexican Mines.

The following is a list of the mines in actual work in Altar district, State of Sonora, derived from official sources, together with the width of vein and owners' names:

NAMES OF MINES.	Width of vein in ft.	Kind of ore.	Owned by—
San Yacelo.....	5	O. & S.	Tully, Ochoa & Co.
Espanaño.....	3	G. & S.	Tully, Ochoa & Co.
Las Animas.....	3	G. & S.	Tully, Ochoa & Co.

## Pumping.

Some Big Work in that Way Soon to be Seen on the Comstock.

A good deal of pumping is now going on at the main shaft of all our leading mines, and there will soon be a great deal more. The Suto Tunnel Co. will do well to look to their drain boxes in the main tunnel and their drainage facilities generally. It is to be hoped there will be no long delay on account of drain boxes for the south branch. The big pumping machinery of the Yellow Jacket Co. will be all ready to start up before the connection is made, and all wish to see them put in motion as soon as possible. When they start up, and a start is made by the big hydraulic pumps at the Chollar-Norcross-Savage shaft, an immense volume of water will be sent into the Suto tunnel in addition to that now flowing that way. Next month we shall see some of the biggest pumping ever in progress at any one time on the Comstock. No fear of the result may be entertained. The pumping apparatus is of such great powers that it will send a perfect river of water rolling up from the lower regions. Then let it be borne in mind that there are no extensive openings in the mine to be drained. The flooded levels are not opened, and all there is to be drained is outside of shafts and inclines in a few straight drifts.

In "Domhey and Son" we are told that pumping in the Peruvian mines broke the heart of Mrs. Pipchin's husband. If Mr. Pipchin could have had such pumping machinery as is now on the Comstock he might not have left the respectable Mrs. Pipchin a widow. Even when pumping fails and breaks hearts, it is still a worthy effort and disgrace no one. Did not the great and good Mr. Domhey himself condescend to say when he heard of the little accident to Mr. Pipchin's heart, and the cause of it, that it was good and had a "rich sound." Mrs. Pipchin, also, evidently thought the same way, as she never lost an opportunity of mentioning the fact that she was the widow of a heart-broken Peruvian mine pump. Doubtless many people, like Miss Tox, pictured the defunct Mr. Pipchin gasping out his last breath with his hands still clinging to the handle of the pump.

Although pumping two inches of water with a pump that throws a one inch stream is doubtless heart-breaking business, we have no fear of the result of the big pumping operations soon to be seen on the Comstock. Indeed, we expect to see stocks take an upward move when the monster hydraulic and steam pumps begin to pull together. We shall then begin to learn something about the unexplored regions of the lode lying between the Savage and the Belcher. —*Virginia Enterprise*.

## Copper Deposits of Silver Bell District.

Mining should be conducted more after the manner of a substantial business investment or enterprise, and in this manner the Huachuca mining and smelting company are carrying on their operations. Mr. W. B. Scott, its superintendent, was interviewed by a representative of the *Arizona Mining Journal*, and from him it was ascertained that the company, although it owned several valuable mining properties in the Huachuca mountains, was at present paying most attention to some recently purchased in the Silver Bell district, the names of which are the Old Boot, the Blue Coat and the Copper King. The only work upon these mines of any consequence was commenced the first of this month, and since that time on an average of 18 men have been steadily employed. The first mentioned property, near its southeastern end, has a cut running with the vein, 30 ft. in length, which shows up a sheet of ore 6 ft. in width. The ore is a red oxide of copper, carrying considerable iron. A shaft is being sunk near the center of the claim. It is now down 12 ft., and is all in ore. It may be here noted that this shaft has been sunk in a large open cut, which of itself displays 20 ft. of ore. From the entrance of this, down the hill for 40 ft., the vein can readily be traced, and consequently at this point it must be fully 60 ft. in breadth. There are at present 60 tons of ore on the dump from this shaft alone, and it will all average fully 20% copper. Northwest of these workings, 350 ft., there is another cut which displays a pay streak 12 ft. wide. Here the oxides are mixed with copper pyrites, but it all runs as high as 20%. On the Blue Coat there is an open cut about 30 ft. in length near its northwestern end. An excellent body of 23% copper ore, 7 1/2 ft. across, is here shown. Near by a working shaft is being sunk, which will strike the vein at a depth of 20 or 30 ft. From this shaft drifts will be run at such distances as may be deemed best for a proper development of the mine.

These properties are arranged in line in the following order, from southeast to northwest: Copper King, the Blue Coat and the Old Boot. At the point of connection of the two last mentioned claims, the iron cropping and conglomerate have been removed and 60 ft. of ore brought to view. The company now has 500 tons of ore on the dumps, and enough is now being taken out daily to

## Supply a 30-Ton Furnace.

One of this capacity will shortly be ordered from either the Pacific Iron Works, or Prescott, Scott & Co. of San Francisco. It will be of the water-jacket type. In 90 days, at the latest, it will be running. A site has been selected about a mile from the mines, where water can readily be obtained by sinking a short distance. Already several wells have been dug, and water rises in these to within eight ft. of the surface. A test of draining these wells has already been attempted, but it fortunately proved unsuccessful. In fact, the natural water level for a large tract of country appears to have been here found. A number of men will soon be set at work digging several more wells, and another force will before long commence work on a road from the mines to Red Rock station, on the S. P. R. R., a distance of 15 miles, the requisite expenditure for which will probably be under \$500.

**IRISH IRON ORES.**—Notwithstanding the disturbed state of some parts of Ireland, we are glad to learn that large quantities of iron ore are being peaceably and regularly shipped from the north of Ireland to this country and America. Some little time since we visited one of these undertakings which so largely conduce to the prosperity of the district—the Evishacrow mine, near Ballymena, belonging to Mr. Chas. Chambers, of Westminster, whose agents for the ore are Messrs. Henry Hughes & Co. of Gracechurch street, London. The Evishacrow ore contains about 43% of metallic iron, and is of singular purity, having no trace of either sulphur, or phosphorus. This class of ore is being extensively used in steel-making. These mines are connected by a branch with the Ballymena, Cumbrell and Red Bay railway, which enables the ore to be sent either to Belfast or Lerne for shipment. The latter port, which is well known as one of the safest harbors in Ireland, has been made accessible during the last few months by the completion of the Ballymena and Lerne railway, which, we understand, was originated by Mr. James Chaine, M. P. for the county of Antrim. A considerable quantity of Evishacrow ore is shipped at Lerne.—*Iron*.

**BEVERIDGE.**—Taylor, McEvoy & Co.'s mill is running steadily on the rich gold ores of that district. Things are lively in the Mexican camp. Eleven arrastras are running on selected ore, that pay \$150 per ton. Quite a number of men are in the camp prospecting, and several fine veins of gold quartz have been found. Moreno & Fuentes, who own the largest mine, allow outside parties to go on their claim and take 25-ft. sections, stripping the top of the vein to a depth of some six ft.; one-third of the ore taken out is claimed by the owners of the mine; the parties taking it out can have their two-thirds worked in the arrastras, or take it elsewhere, as they please. The mines are near the summit on the east slope of the Inyos; the country is terribly rough, and no wagon roads can be made to them nearer than the base of the mountains. It seems to be a settled fact that this will prove a rich and prosperous mining camp, notwithstanding its inaccessibility. —*Inyo Independent*.

## Rye Valley Mines, Oregon.

From a recent number of the *Bedrock Democrat* we take the following concerning the Rye Valley mines:

Rye Valley mining camp is situated about 35 miles south of Baker City, in Baker county, Oregon.

Powers & Co. own and operate the placer mine, water rights and ditches. Their mines consist of 40 acres of heavy gravel banks, from 6 to 30 ft. deep, paying from gravel roots to the bedrock. In the mining season they run three hydraulics, each averaging from \$100 to \$125 per day; besides selling large quantities of water to other claims. Their flume or creek ground consists of 234 acres, patented, which has been sufficiently prospected to prove it of great value. Three-quarters of a mile above these rich placers are located the celebrated quartz mines belonging to the New England and Oregon mining company, incorporated under the laws of Connecticut, with head office in Concord, N. H., with Benj. F. Cedwallader, President; John W. Drew, Secretary, and a Board of Directors of the most prominent business men in that State.

The property consists of "Green's Discovery," "Monument," and "Macedonian" lodes, all true fissure veins; a splendid steam quartz mill, of latest improved machinery and perfect in all parts; a saw mill attached and run by same power; a blacksmith shop, boarding house, sleeping room and superintendent's office—all kept in splendid condition.

This company commenced operations last June, mostly developing the rich ore bodies in the "Green Discovery." Working has been planned with care and judgment, and successfully carried out, which the output of rich ore now on the dumps and in eight in the mine will verify. The foreman is an experienced miner, and thoroughly understands the underground workings of the mine.

Mr. Locke is now East purchasing new machinery and hoisting works, for erection on the Monument next summer. It has not reached that state of development to tell its actual value. A shaft has been sunk on the ledge to water level, which develops a true fissure vein of rich ore, showing large quantities of native and horn silver, some samples going over 9,000 ounces to the ton, and others running far into the hundreds. It takes no prophet to predict an early advance of the company's stock. Work, so far, has been done in a very substantial manner, all timber and wood necessary for the winter, as well as other supplies, were laid in last fall. The company is proceeding strictly on the true plan of development—working its mines instead of its stock.

The Oregon branch of the U. P. R. R., commencing at Granger City, on Green river, will be completed to Baker City inside the next 16 months; the line of survey runs within six miles of Rye Valley. The O. R. & N. Co.'s road from Portland to Baker City will be completed next fall. The completion of these lines and telegraphic communication will greatly enhance all mining property in eastern Oregon.

To tell all about Rye Valley, its brilliant prospects, rich mines, both quartz and placer, its many inducements for the investment of capital for legitimate mining, would take more space than we can spare in this issue. But for quality of quartz and gravel, characteristics of permanence, facilities for working, cheap and skilled labor, abundance of wood and water, climate, etc., makes Rye Valley bid fair to become one of the most productive mining camps in the vast rich mineral belt of eastern Oregon.

## American Mining Companies in Mexico.

There are to-day in the State of Chihuahua, says *El Fronterizo*, six American companies engaged in working mines. We will make a brief mention of them. The mining company of Santa Eulalia owns the famous mines of that name, 16 miles from the city of Chihuahua. In former years these mines paid to the Catholic church contributions, or taxes, to the amount of \$11,000,000. Although they have been worked for many years, they are still very rich. The Americans have been deliberating on piercing the mountains by a tunnel, and constructing a railroad as far as the confluence of the Sacramento and Chihuahua rivers, so as to place machinery there to work the metals. The Cusi-quilachi mines were bought last year by a San Francisco company for \$500,000. These mines are 90 miles from Chihuahua. The veins at the depth of 600 ft. contain solid metal in some cases to the breadth of 15 ft. The metal has been treated by lixiviation. The Batopilas mines in the southwest of the State, of which Messrs. Wells, Fargo & Co. are the owners, contain great deposits of silver and produce large sums to their workers. The archives of the Chihuahua show that these mines produced, during the rule of Spaniards, the vast sum of \$400,000,000. The Parral mines belong to the Knott company, of Chicago. These mines are in the city of Hidalgo. According to the State archives, these mines have yielded \$60,000,000. An Indiana company owns the La Luz mine, which is five miles from the Parral. The Guis, or gravel mines, are owned by the Chicago mining company. These mines, also five miles from the Parral, are famous for having at one time produced an immense *bolsa* (nugget) of virgin silver.

This country produced 4,295,414 tons of pig iron in 1880—a very large increase over previous years.

## MECHANICAL PROGRESS.

## The Strength of Iron at High Temperatures.

A very interesting series of experiments has lately been carried on by Dr. Kollman, on the strength of iron and steel at high temperatures, at the works of the Gutehoffnungshütte, near Oberhausen. Two testing machines were used to determine the resistance of the iron. In one of these machines the load was applied by means of a hydraulic press, and measured by dead weights, acting through a system of levers. The other machine—direct loading was applied to the extension of the test piece, taken up by a screw and hand gear. The machines were checked before every test.

In the tests made, only ordinary iron, as daily produced at the works, was employed. Fibrous iron, fine-grained iron, and Bessemer steel were tested, their relative specific gravity being 7.62, 7.69, and 7.84. The test pieces used were made from blooms reheated once and rolled down. The Bessemer steel pieces were twice reheated. The length of the parallel part of the test piece was 1.38 inches, while a different specimen was used with a parallel length of 2.65. Two short specimens were used at very high temperatures, as the elongation of the long pieces was too great to permit rupture to take place with the range of the lever.

The calorimeter used is a cylinder of thin sheet copper, 3.94 inches in diameter by 11.8 inches high, surrounded by slag wool contained in a wooden case, having a handle. A pocket is provided for the thermometer to prevent its breaking. The thermometer used was a very accurate one, divided into tenths of the centigrade degrees.

The following are the deductions from these experiments: The ordinary temperature at which iron is rolled is determined by careful experiments, and was found to be 2,236° to 2510° F. The temperature at the first pass of the roughing down rolls was 2,264 to 2,217 F. The temperature of the bars delivered from the rolls varied with their section and ranged from 1,382° to 1,760° F. Mild Bessemer steel is also rolled at about the same temperature, as it is so soft and tough that it can stand this heat without burning.

Another important point has also been developed by Dr. Kollman's experiments, that metal which has been raised to a high temperature in a furnace with a reducing flame, is much easier to roll; however, the Siemens furnace, with the gas flues above the ground, is preferred.

A table is given by Dr. Kollman containing the result of 52 experiments, showing the effects of rise of temperature in the reduction of the resistance to rupture and the increase in the contraction of sectional area as well as of the extension. Taking the initial temperature 32° F., and the resistance of iron to rupture at this temperature at 23.81 tons per square inch and calling this breaking load 100, then at a temperature of 200° C., the breaking load is decreased to 22.6 tons or 95% of the load at the initial temperature; at 300° to 21.4 tons or 90%; at 400° to 17.39 tons or 73%; at 500° to 9.14 tons or 38%; at 600° to 4.44 tons or 19%; at 700° to 3.94 tons or 16%; at 800° to 2.54 tons or 11%; at 1,000° to .05 of one ton or 4%; while at 2,250° it broke without the application of any appreciable load. This experiment simply opens the way for other and more elaborate experiments in the same directions. The results are important and we shall look with interest for further developments from our German friends, who are so peculiarly fitted for investigation.—*Engineering.*

**COMPOUND LOCOMOTIVES.**—M. Mallet has recently published additional data on the working of compound locomotives. A locomotive built according to his plans was first exhibited at the Paris exhibition, and some time later he read before the English Institution of Mechanical Engineers a paper describing it and giving particulars as to its working on the Bayonne and Beatty railroad, France. From his latest report it appears that his engines required 3.3 lbs. of fuel per horse power per hour. They weigh full 196 tons, have a small cylinder 9.45 inches in diameter and a large one 15.75 inches in diameter, with a 12.72 inch stroke. The steam pressure is 150 lbs. The quantity of fuel consumed during times of heavy traffic was 13.8 lbs. per train mile. In view of the growing use of high pressure compound stationary engines, these results are of much interest.

**A NEW RAILROAD INVENTION.**—Jeanty Denechand, Sr., ex-Assistant Engineer for the construction of the Southern railroad of France, for many years a resident of this country, has recently obtained a patent for an invention which he designates "The Traveler's Safeguard," and is intended to prevent locomotives, passenger and freight cars from jumping the track. The safeguard consists of a steel or iron arm, with rollers at each end, affixed to car trucks in front and behind, which may be adjusted or removed at will in a very short space of time, by hand or by means of compressed air, as air-brakes are now applied. The inventor, in order to apply his invention, has devised a new style of rail. The rail is a double one, or more properly speaking, a reversible one, so that when one side is worn out it may be renewed, and the other side used.

## Malleable Castings.

Considerable pretense of mystery is assumed by manufacturers of malleable castings, both in this and the old country, and doubtless there are some trade secrets of value to those in the trade, relative to mixtures of different irons, etc.; but the process is in itself simple, and a little experience should enable any foundryman to attain a creditable success in it. Nearly every foundry has its own mixtures and methods, but they are all based upon the processes of Samuel Lucas, of Dronfield, which date back to 1811. The general features of the process, iron as carried out by the Birmingham (England) founders, is given in the *Ironmonger* as follows:

"For the purpose of the casting, pig of a fine quality is needed, and great care is used in the preparation of the molds, so that there may be no flaw or imperfection in the casting. The latter, after cooling, is, of course, hard and brittle, and it is to remove this brittleness, and give it the character of malleable iron, that the special process is required. The casting is now placed in hermetically sealed pots or boxes, surrounded by powdered ore, and subjected, for several days, to intense heat, which, by cementation, gradually softens it, and renders it malleable to the core, when it may be bent or wound into any shape. The annealing process takes, ordinarily, about 10 days. Thus, a pot made up on Tuesday is got up to a white heat about Friday, and this heat is maintained for some 24 hours or more, according to the size or thickness of the article annealed. The fire is then allowed to die down, and, when the mass is cool, the castings are found to be thoroughly annealed and malleable. Scarcely a trade in Birmingham fails to use malleable castings for some purpose or another.

"The introduction of Bessemer steel has somewhat operated against the trade, but there is still a great field for malleable iron founders, in catering for the requirements of the Birmingham gun, harness and engineering trades."

The journal quoted thinks it much to be regretted there is not a more free interchange of ideas and experience among English iron founders, as in this only is there hope that the English trade can keep pace with German and French progress in the art.

## Styles in Architecture.

We submit the following as being worthy of the consideration of American architectural students:

First. "Style implies some dominating influence reflecting the mind of the age in all its works, and therefore presumes a certain unity of character throughout."

Second. "The primary elements of style are constructive, and the design of work should have regard to construction, and consequently to the proper use of materials, prior to the consideration of its ornamental decoration."

Third. "As construction necessarily implies a purpose, utility must have the precedence of decoration."

Fourth. "As construction necessitates a proper consideration of materials, and as each material has its own mode of manipulation, and is wrought by separate and varied processes, design must be bad which implies indiscriminately the same constructive forms or ornamental treatments to materials differing in their nature and application."

Fifth. "As the greater regulates the lesser, the building should determine the style, and all of what it contains of furniture or decoration should conform to its characteristics, and thus there should be a proper uniformity of style throughout, and a subordination of all the inferior objects to one another and to the whole."

—*Builder and Woodworker.*

**FUSIBLE PLUG FOR STEAM BOILERS.**—A new English patent is described as follows: "The plug is made with an upper and a lower portion. The upper portion can be introduced into the water through the lower one, over the furnace. The upper portion is of a hollow, cylindrical form, terminating with a stop end, the end having a cylindrical opening to receive a conical plug, which has a slight projection on its upper side to hold a piece of the fusible metal. Over the first layer of fusible metal is a second layer, which melts below the boiling point of water, and by its agitation keeps the lower layer of metal free from incrustation." If this matter is thoroughly practicable, and we cannot see why it is not, one of the greatest bugbears against the reliability of fusible plugs is certainly removed, and there is no reason why this plug cannot be put in upon the backhead of a tubular boiler, or any other boiler for that matter, by turning an angle in the inner tube so that when the tube was put right side up this low temperature fusible metal shall be at the top.—*Boston Journal of Commerce.*

**STEAM PACKING.**—Mr. Watson, in his *Mechanical News*, says that the best packing he ever used for faced joints, either steam or water, is common drawing paper soaked in oil. After a short time the heat of steam converts it into a substance like parchment, so that it is practically indestructible. It has the advantage of stripping readily from surfaces when it is desired to break a joint.

**CRACKS IN BOILERS.**—A new method of repairing cracks in boilers, invented in Germany, consists in the use of a sort of wedge link—a pair of tapered pine connected with each other in one solid body by a flat wedge.

## SCIENTIFIC PROGRESS.

## New Theory in Regard to Lunar Volcanoes.

M. Faye, according to the *Chronique Industrielle*, recently delivered a lecture at the Sorbonne, in which he criticised the prevalent belief that volcanoes exist on the moon, and offered a theory of his own to account for the objects that have been taken as craters due to volcanic action. Water, he said, is the sole cause of volcanic eruptions. Now, on the moon there is no atmosphere; this is a fact recognized by every one, and it is absolutely confirmed by observation of occultations. Since there is no atmosphere there, of course there can be no water, for the latter would instantly evaporate under such conditions, even did it exist. So, since there is no water in the moon, it follows that there can be no volcanic action and consequently no volcanoes. But there are circular cavities on the moon, nevertheless. What are they then, and how have they been formed? To account for these, M. Faye asked his auditors to imagine a river frozen over from shore to shore. Such being the case, the tides will exert a pressure on the under surface of the ice, and if a hole exist in the latter the water will quickly issue up through it and congeal around its edges. And so each successive outflow will freeze over its predecessors until the successive layers form a marginal ring of some height around the aperture. From this we may get an idea of the alleged lunar volcanoes, which are diametrically opposite to those that exist on earth. The craters of our terrestrial volcanoes, that of Vesuvius particularly, are at the top of high mountains; the craters of the so-called lunar volcanoes are, on the contrary, in the center of low hills. The bottom of terrestrial volcanoes is greatly elevated above the mean level of the surrounding land; that of the alleged lunar ones is deep down beneath the surrounding ground. Terrestrial volcanoes are conical mountains thousands of feet in height, having at their summit a crater some hundreds of feet in depth, while the circular cavities on the moon are wells several thousands of feet deep and surrounded by a sort of curb some hundreds of feet in height. The circular hollow called *Copernicus*, for instance, is 11,000 feet deep, while its marginal hill is only about 2,600 ft. in height. These circular cavities, then, are veritable wells, and they were formed, according to M. Faye, as follows:

At the epoch in which the moon, covered with a thin solid layer, took less than a month to accomplish its revolution around the earth, tides were created on its surface by the latter. The incandescent and liquid mass, covered by a thin coating that might be well compared to an egg shell, was attracted by our planet, and thereby caused to dash up against this solid layer. Now, if we suppose that small orifices were accidentally created in various parts of the still thin crust, the waves formed by the tide would cause some of the molten mass to issue through these apertures, while the surrounding crust would everywhere else resist it. This liquid would flow over the edges of these well holes, and being unprotected against the cold of space would at once solidify. And, as we have just seen in the case of the frozen-over river, at every tide the margin would increase in height by the superposition of new outflows. Finally a moment would come in which the bottom itself would solidify. But this being situated at a great depth, and being protected against external influences, would remain for a short time in a pasty condition. If at such a moment a new flux should take place, the middle of the pasty bottom would be thrust up, and in solidifying would remain considerably elevated in comparison with the surrounding portions of the bottom. Thus may be explained the existence of the peaks which are observed in a large number of these lunar cavities.

Such is an outline of M. Faye's new theory. "If," says the author, "I am asked by what considerations I am led to make known the results of my observations and researches, I answer that I am seeking, first, to banish from science a gross error by proving that these lunar cavities are not volcanoes, for no explosion can take place where there is no explosive material. Then, again, from a geological point of view, I have wished to study in the formation of the moon those phases of the past which may give us an idea of the phases to come. Although the geology of the moon differs completely from that of the earth, this very opposite nature is a valuable element of discussion. It will serve to banish vain theories, and to put in a clearer light the phenomena of which the earth has been the theater."

**PRESERVATION OF THE COLORS OF DRIED PLANTS.**—According to M. Storz, the slow immersion of the fresh plant in a boiling solution of one part of salicylic acid in 600 parts of alcohol, and then shaking off superfluous moisture, previous to pressing in the usual way between blotting paper, will more nearly preserve the natural color than any other method.

**A NEW CHINESE ALPHABET.**—Bishop Eligio Cusi, at Chang-Tong, in China, has invented an alphabet of 33 letters, by which, it is said, all the sounds of the Chinese language can be represented. The characters used by the Chinese number 30,000.

## The Effect of Freezing on Plants.

When frost attacks plants to such an extent that ice is formed in their tissues, says the *Gardener's Chronicle*, it has been observed that the ice does not occur within the bag or cells of which the plant is made up, but outside or between them. The reason of this is probably because the contents of the cells are thicker and denser, and do not freeze so readily as do the thinner and more watery juices in the spaces between the cells. In this manner the essential part of the cell—so far as its life actions are concerned—the thick protoplasm, is less liable to injury. Moreover, as a consequence of the low temperature, the watery part of the cell contents exudes from the interior through the cell walls and there freezes. The expansion which takes place when water freezes, therefore, does not, at least in slight cases, take place within the cell, where it would do mischief by bursting the cell walls, but outside them, where there is more room to expand and less risk of tearing the tissues. When the frost is more severe the tissues do become torn, cracks and fissures occur, the protoplasm is killed, branches fall, leaves wither or rot, and death ensues. But where the injury is less, and especially where the protoplasm is uninjured, when the thaw comes the ice outside the cells becomes melted, and the water, by the power of diffusion, passes once more through the cell wall into its cavity, there to mix again with the more dense protoplasm. It is clear, then, that the danger to plants from frost is proportionate to the water they contain. If they are in an unripe, sappy condition the danger is far greater than if they are comparatively dry and at rest. Tubers and seeds, for instance, are especially adapted to resist cold; and how well they do so has been shown in the case of wheat which germinated at home after having remained throughout the winter in the Arctic regions.

## Heating by Electricity.

We have been much pleased to notice the various comments upon an article in *Scribner's Monthly*. One thing treated of in this article was the fusing disc for cutting iron, and the other was the production of heat by friction for warming water to heat a railway car. The water in this case has to be heated by friction discs, driven at a high rate of speed by some sort of connection with the axles of the railway car. We believe there is a great deal shorter way to heat a railway car or to heat a room. Some months ago a gentleman forwarded to us a model of what he called a "thead pan." We have spent some pleasant hours with it, and recently very much astonished some gentlemen of Boston, who are underwriters and mechanics, and are great on the electric light question. This little arrangement was connected to a dynamo-electric machine of small caliber, and in less than two minutes it was so hot that the gentlemen readily warmed their hands, as from a steam radiator.

Now why cannot something of this sort be attached to a railway car? It can be made of larger or smaller capacity, so as to have one under every seat, or every other seat; they are all connected by a covered copper wire; they would not leak, the water would not freeze up and break the pipes and it requires a great deal less power to generate the electricity than it would to generate heat enough to heat water and then, by secondary radiation, warm the car. There is no reason why houses, offices and factories cannot be warmed by electricity cheaper than by steam. The matter is an actual fact; has been patented, and other patents are now pending. It will not be a strange thing if, within another year, this little apparatus is put into operation. It has only been shown twice, and in each case has been a source of much surprise and gratification to men who are usually considered well up in mechanical and other matters.—*Boston Jour. Com.*

**IRIDIUM FOR ELECTRIC LIGHTS.**—The latest material offered for an incombustible "burner" for the electric light is iridium. Mr. Holland, gold pen-maker of Cincinnati, claims to have discovered a flux by means of which he is able to fuse iridium in an ordinary draught furnace. He casts the metal in any shape desired, and in bars or ingots weighing as much as ten ounces. The metal thus fused and cast defies the file and resists all acids. The only mechanical way of cutting it is by friction with a copper wheel charged with diamond dust or fine corundum. Mr. Holland claims, further, that the cast iridium makes suitable "burners" for the electric light, and that so used the metal is durable without protection from the atmosphere.

**OCCLUSION OF GASES BY METALS.**—M. Dumas finds that not only do iron and silver possess the property of retaining large amounts of gas for an indefinite period, but that aluminum and magnesium also have the same property. For equal weights, magnesium contains a volume twice as great as aluminum; but magnesium is so much lighter than aluminum that it will hold only one and a half times its own volume. Silver seems to prefer oxygen; aluminum and magnesium, hydrogen; each metal appears to have its individual preference.

**THE NEXT TRANSIT OF VENUS.**—The French Academy of Sciences has appointed a commission, under the Presidency of M. Dumas, to make the necessary arrangements for observing the transit of Venus in 1882.

## The Future of Mining.

We take the following from the *Leadville Circular*:

"Statisticians tell us that the total amount of gold and silver in the world is about \$20,000,000,000, of which about one-tenth, or \$2,060,000,000, have been added to the world's supply by the mineral belt of the United States since the discovery of gold in California in 1849. They further state that about one per cent. of the mineral belt of the United States has been explored, leaving 99% unexplored. If this 99% yields as much mineral as, and no more than the 1% already worked, the belt may be expected to yield in all \$203,940,000,000, rather more than 10 times the present total volume of gold and silver known to be in existence.

"How long it will take to dig out this amount of precious metal is of course a conundrum. At our present rate of production, the belt would last 2,500 years. But as geological and mineralogical science improves, and our knowledge of the geography of the belt increases, production will rapidly grow. Mr. Clarence King estimated that within a very few years the production would reach 1,000 millions per annum, at which rate the belt would last 200 years. As soon, however, as it becomes generally known throughout the world that mining in the United States is the most profitable business ever undertaken by man, such large numbers of persons will embark in it that the whole belt will be worked simultaneously, and its productive life be correspondingly shortened.

"If these estimates are any way near the truth, a startling disturbance in prices may be expected at any time. Prices will not wait for the actual production of the precious metal to advance. They always discount the future.

"If the mineral belt of the United States yields within a generation or two only one-tenth what is expected by statisticians as above stated, everything interchangeable for money will probably double in value within ten years. The effect on prices will probably be the same as an enormous issue of irredeemable paper money. We all remember the effect of the issue of about \$2,000,000,000 of paper money during the war—how every one grew rich, and property of all kinds rose 5, 10, 20 and 100-fold in market value. The like result will follow the development of our mines, if they are what geologists say they are. But there will be this difference. When Government ceased to issue paper money, and began to call it in, prices fell, not as rapidly as they had risen, but fell steadily for 12 years, and more men became poor than had grown rich; whereas the advance in prices which will follow a doubling of the world's stock of the precious metals will go on until the world's population doubles, and the consumption of money in enterprise, industry and commerce is twice what it is now.

It is by the light of these considerations that the active speculation which has prevailed in London, Paris and New York for the past year or two must be studied. There are plenty of men in those financial centers who are well aware of the facts above stated. In lifting prices to what seems a giddy height to those who are ignorant of the mineral prospect, they are merely discounting an inevitable future."

**SWANSEA DISTRICT.**—The *Inyo Independent* says: Mr. J. H. Ely has a force of men at work in this district prospecting the claims lately sold by Moran and Luhnke to New York parties. On the Mountain Star mine two shifts of men are at work, and Mr. Ely expects to strike a body of ore in a short time. This mine has a splendid prospect; it is one of the series on the same ledge or belt as the Indiana and Virginia which has produced such rich ores. The Swansea Belle is also reported as showing rich ore in the bottom of the shaft. New discoveries of fine smelting ores have been made a little to the north of the French Flag and Pioneer mines, and on the same belt. There is every evidence that immense bodies of argentiferous lead ore exist in this locality. On the French Flag and Pioneer locations the surface showing is astonishing; ore crops out on every hand in a bewildering manner. Several small shafts have been sunk, covering a width of over 50 ft. on the French Flag, and all in ore. Swansea is waking up, and in our opinion it will not be long before it will come to the front as one of the greatest bullion producing districts in the State.

**LITHOGRAPH STONE.**—The *Kern county Gazette* is informed that a valuable discovery has been made in the Tehachepi country. A Mr. Campbell, an artist, who was traveling in that section some two years since, discovered some stone, which he believed to be valuable, and took specimens, which he sent East for the purpose of having them examined. He finds that it is a superior quality of stone for engraving on, and has taken a claim, with the intention of supplying the market. This stone is very scarce and sells very high. The United States Government probably uses millions of dollars per year in its purchase, which is used in engravings for bonds, currency, stamps, etc.

**EMPIRE.**—The *Free Lance* says: The old Empire mine is working away steadily and with good results. A late clean up at the mill gave a result of \$6,000, the ore yielding about \$25 per ton. All this rock was taken out by hyruters. There are about 80 men working in the mine, nearly all of whom are "tributers." The Empire is the oldest quartz mine alive on this coast, and it will be alive for many years in the future.

## The Ludwig Copper Mine.

The Ludwig copper mine, owned by the Ludwig Copper mining company, is situated in the Walker River range of mountains, Eastern district, and eight miles west of Greenfield; post-office address, Mason Valley.

Mr. Ludwig, who has for eight years been working the mine and taking the ore to Dayton to be made into bluestone, was in Gold Hill the other day, and brought ores and a specimen of the copper as run into bars by the recent three hours' work of the furnace. No purer copper need be asked than is the bar of 200 lbs. brought in. It is 95½% fine, the odd 4½% being iron. While the furnace was in operation it ran but one-half of 1% of copper into the slag, as has since been proved by Chris. James, the Gold Hill assayer.

During the past eight years' work in the mine the richest ore taken out has been bailed to Dayton. This left 4,000 tons on the ore dump, assaying 14½% in copper—or 290 lbs. of copper to the ton. The last quotation of copper in New York was 19½ cents per lb. It used to cost \$300 per car to ship the ore to New York—10 tons to the car. No arrangements have yet been made to ship the bars. Ore, as it comes from the mine, will yield 20% of copper, or 400 lbs. per ton.

The furnace, which will soon be in running order again, will reduce from 35 to 40 tons per day, and will consume from 600 to 700 bushels of charcoal, worth 24 cents per bushel at the mine. Wood is there worth \$9 per cord.

The mine has been opened by a tunnel run in 100 ft., at which point it is 60 ft. below the surface. A shaft or winze has been sunk 100 ft., also an incline to the same level, the incline approaching nearly a perpendicular, being 116 ft. to the 100 ft.

The ledge is 80 ft. between walls, and in some places the pay ore is 32 ft. wide. The west or footwall is spar, the hanging wall quartzite. There are 2,500 ft. in the claim and 1,000 ft. of stope at an average height of 50 ft., all now ready for breasting out the ore.

The mine is four miles west of Jackson's mine. The ore needs no foreign flux. Iron was taken over, but the trial of the furnace demonstrated the fact that the ore contains exactly enough flux in itself.

Capital from Gold Hill has become invested in this business, and it is in the hands of men who are enterprising, energetic and will make a success of copper mining in Nevada if anyone can. In fact the experiment has already been successfully made. It only remains to tighten up the water-jacket of the furnace and go ahead.—*Gold Hill News*.

## The Coming Fuel.

Coke to Supersede Charcoal and Other Fuel for Smelting Purposes.

The burning and manufacture of coal, says the *Eureka Leader*, is one of our most important industries, and furnishes employment to a large class of our people, but it is thought this industry will soon be greatly lessened, if not entirely eradicated, by the importation of coke for use as a smelting fuel. In the early days of Eureka smelting, and even at the present time where the old-fashioned stone furnaces are used, the burning of coke cannot be successfully accomplished. The heat generated from the coke is of so intense a character as to too rapidly burn out the soft fire-rock used in the construction of stone furnaces, and for other reasons it is not as practicable a fuel as charcoal, but in the more improved iron and water-jacket furnaces that are fast superseding the old stone furnaces these objections can not be advanced. In comparison, coke is far the superior of the two fuels. Charcoal is a bulky, variable and unsatisfactory fuel; hard to procure, unwieldy and troublesome to handle, and losing from five to six per cent. in the process of use, while coke is steady and reliable, more intense, does not lose in handling, and it is claimed, gives more satisfactory results in smelting in every way. At present, English coke that comes "the Horn around," a distance of at least 20,000 miles, can be landed in Eureka for \$30 per ton, while the American article transported by rail across the Continent nets \$55 per ton delivered in Eureka. At these rates the use of coke is easily barred on the range, and it cannot become a general fuel until by means of competition the extortionate rates of the C. P. and U. P. roads are lowered, which will surely come before many years. In Colorado, where coke is the standard fuel for smelting, it is delivered for \$6 to \$8 per ton, and there is no doubt that when the several southern trunk lines that are in course of construction across the Continent, are reached by railroad connection from Eureka, it will be landed here at a trifling advance on that price. When that time comes, the profitable working of our immense deposits of low-grade ores is assured, and Eureka will be one of the greatest smelting centers in the world. The connection by rail with the coal fields of southern Utah is only a matter of a little time, and it is not improbable to believe that Eureka will be drawing its fuel from that section inside of six or eight years more.

A DISPATCH from Seattle, W. T., says: "Some little excitement exists here and at Newcastle over lead, gold and silver-bearing quartz, said to have been discovered near the latter place, assaying \$100 to the ton. Up to Saturday evening some 20 claims had been located.

## Cheap Electric Light.

The distinguished Tynesider, Sir Wm. Armstrong, began to use the Swan electric lamps some six or seven weeks ago at his country residence, at Cragside, Rothbury, near Newcastle, and one of the most remarkable facts in his experience with it is that he obtains the motor or mechanical force, which is in due course converted into electricity and eventually into light of brilliant whiteness, without the use of steam engine, or gas engine, or anything of the sort. Of course, he must employ a dynamo-electric machine so as to generate the requisite electricity, but that is set in motion by a six-horse power turbine used as the motor, and which is so disposed close by a neighboring brook as to take advantage of that natural source of power. The turbine and generator are situated about 1,500 yards from the mansion, and, therefore, as the electric circuit has to be completed, a stretch of copper wire of twice that length, or 3,000 yards, has to be used. But after that has been done, and all the lamps are in position and put in circuit, the light for the whole of the house is got for nothing. Now, let us see what the light amounts to. Sir Wm. Armstrong has 45 lamps distributed through his house, but, as he can switch off the current from room to room, he never requires to have more than 37 in light at once, and for that number of lamps six-horse power proves to be amply sufficient, notwithstanding the great length of the conducting wire used, and the dissipation of energy consequent thereon. His library, a room of 33 ft. by 20 ft., with a large recess on one side, is well lighted by eight lamps, four of which are clustered in one globe of ground glass suspended from the ceiling in the recess, while the remainder are distributed singly and in globes in various parts of the room upon vases which were previously used as stands for duplex kerosene lamps. The lighting of the dining room is also effected by the use of eight lamps, six of which are grouped together in one glass shade suspended over the center of the table, the other two being used singly as bracket lamps, one at each side of the room. Twelve overhead lamps are employed to light a picture gallery, which is also used as a drawing room; but when the eight lamps in the dining-room are no longer wanted the current supplying them is switched off to the gallery for lighting eight additional lamps, making 20 in all. Sir William remarks that the gallery is agreeably lighted even with the 12 lamps, while with the full illumination the pictures are seen as distinctly as in daylight. In the passages and stairs the lamps are, for the most part, used without glass shades, and present a very beautiful star-like appearance, not so bright as to pain the eye in passing, and very efficient for lighting the way. The turbine and generator at Cragside are occasionally used in the daytime for the transmission of motive power to a second dynamo-electric machine acting as a motor to drive a sawing machine. It does so with good effect, but Sir Wm. Armstrong is not prepared to say how much of the original power is realized, or what should be the proportions between the generator and the motor to give the best effect.—*Engineering and Building Times*.

**THE CENTENARY OF GEO. STEPHENSON.**—In view of the approach of the hundredth anniversary of the birth of George Stephenson, the eminent railway engineer, who was born on June 9th, 1781, the Amalgamated Society of Railway Servants have started a movement for commemorating the event by a centenary festival, having for its object the benefit of the benevolent institutions established for helping railway servants. A great fete, in aid of the Railway Servants' orphanage, is to take place at the Alexandra Palace, and it is proposed to hold simultaneous celebrations in various parts of the country, having for their object the benefit of the disabled, the aged, the widows and the orphan of railway servants, of all grades, throughout the United Kingdom. It is hoped by the committee that the proposal will meet with universal support, having regard to the great work which Stephenson accomplished, and the vast benefits which the world in general has derived from his inventive genius. Application is to be made to the Lord Mayor of London to head the movement.—*Engineering and Building Times*.

**PLATINUM.**—The only platinum worker in the United States is Joaquin Bishop of Sugartown, Chester county, Pennsylvania. Recently the Association of Mining Engineers made an excursion to the works of Mr. Bishop to see his workings of this intractable metal. Mr. Bishop, who gets most of his supply from the Ural mountains, in Russia, has been working platinum for 40 years. In 1845 he took a premium, but at that time the demand for platinum was so small that it only occupied him one day in the month, using the metal principally for rivets to fasten artificial teeth. Before the engineers, Mr. Bishop melted a piece of platinum with the ease that a plumber melts lead. The intense heat used may be imagined when it is known that a steel file held in the blast burned like a piece of wood. The Russian government used platinum in its coinage until 1864, when about \$2,500,000 worth of platinum coins had been struck.

A NEW YORK mining paper, in speaking of a certain mine, says the superintendent is under the impression he will find better and larger quantities of rich ore as the drift attains greater depth.

## Gas-Lighted Buoys.

The idea of illuminating floating beacons by means of gas appears at first sight to be rather a visionary one. On looking into the matter, however, we shall find that it is not so, nor even an idea at all now, but an accomplished and a practical fact. It is not, however, effected with ordinary coal gas, nor do the ordinary conditions of consumption obtain. The means by which this end is attained are the same as those which have at length rendered efficient railway-carriage lighting possible, namely, Pintsch's oil-gas system. At page 145 of our last volume will be found a full description of this system, and at page 469 are particulars of its most recent application on railways in connection with the London and South-western system. We need only, therefore, now observe that it consists in distilling the refuse of shale oil, or other similar matter, and in storing and using, under considerable pressure, the gas produced from it. If this storage and use can be successfully accomplished on land—and we need hardly say that it not only can be, but is—it should follow that, other things being equal, there can be no difficulty in storing and using it under similar conditions on water. Nor is there any difficulty in this respect, the system having been carefully developed, step by step, from a clever idea into actual practice. The buoy itself is made the recipient for containing the compressed gas, and the lamp, which is mounted on the top, will burn for periods of 6, 9, or 12 weeks, according to size, with one filling, the diameter being 7 ft., 8 ft., and 9 ft. respectively. The buoys are made of wrought iron and of the necessary strength for resisting the internal pressure and the external blows incidental to each objects afloat. The Trinity House has two spherical buoys lighted on Pintsch's system, the gas for which has, up to the present time, been supplied from the Great Eastern railway gas works, at Stratford. Pintsch's system being in use on that line for carriage-lighting. Arrangements are, however, being made with a view to the establishment of a small gas works in connection with the Trinity Board, and it is probable that this plan will shortly be carried out. One of the Trinity House buoys was placed on the East Oaze station, near the Mouse lightship, on the 18th of April last, and remained at its station until the 28th of last month, when it was unfortunately run into and damaged by a passing vessel. The Trinity House report that during that period the light was burning without intermission, although it is stated by the officer in charge of the Mouse light vessel (½ mile distant) that in bad weather the buoy itself was at times hidden from view by the spray of the sea.

At Port Glasgow, the Clyde Lighthouse trustees are building a gas works on Pintsch's system for the service of illuminated buoys on the Clyde. One of these buoys has been burning on the Rossneath Patch for some time past, being supplied with gas from London. A second—a bell buoy—is about to be delivered by Pintsch's Lighting Company for use on the Clyde. This company is also about to dispatch a buoy to Port Said for the use of the Suez canal. This buoy we recently had an opportunity of inspecting, and can testify to the excellence of the light given. It will show a red light day and night for six weeks. The buoy is seven ft. in diameter, and has a capacity of 150 cubic feet. The gas will be stored at a pressure of seven atmospheres, or 105 lbs. per square inch, which give 1,050 cubic feet of gas in the compressed condition. The gas being burned at the rate of seven-tenths of a foot per hour renders this supply available for six weeks. The estimated cost of gas per 24 hours' consumption is 2½d., not a very extravagant cost, it will be admitted. The process of refilling a buoy is merely a matter of a few minutes. The gas is taken to the buoy in a tender, and is passed from the reservoir, or store-tank, by means of a flexible tube into the buoy, where it is stored for consumption at the required pressure. By the adoption of gas works on shore, in the vicinity of the buoys, the whole operation is reduced to a very simple system. From the proved efficiency of these buoys, and the special advantages they offer for making entrances to harbors, river passages, wrecks and the like, there can be but little, if any, doubt of their general adoption for the purposes we have indicated, as well as for others of a cognate character.—*Iron*.

**TIAGA STARTING UP.**—O. H. Brooks, Assistant Superintendent for the Great Sierra mining company, will on Monday next commence work on the company's property, the Mount Dana mine, in Tiaga district, with a force of 15 men. The Mount Dana is one of the largest silver-bearing ledges in the country, carrying an ore vein 62 ft. in width and vein matter to a width of nearly 200 ft. The ore is of high grade, running from \$40 per ton up into the hundreds, with a touch of refractory elements that prevent free milling, but these are readily expelled by the Frue concentrator, a rapid and economical process. The development of this property will doubtless bring Tiaga into prominence as a rich mineral region.

The *Truckee Republican* says it reported that the bonanza firm has made a contract with parties at Reno for 200,000 cords of wood. If this report is true it shows that faith in the future of the Comstock has not died out entirely in the breasts of those chiefly interested.

## Apprenticeship.

A firm of machinists of Springfield, Massachusetts, finding it difficult to get thoroughly qualified workmen, are making an effort to restore a good system of apprenticeship. The *Iron Age* gives an outline of the plan adopted. It is, in effect, an industrial school, most of the time being devoted to practice instead of theory. The apprentices will be required to devote during each week fifty-eight hours to work and nine hours to study. The *Age* says:

The term of apprenticeship for those beginning to learn a trade, who are under 20 years of age, is six years, in which time, under this system, it is believed an apprentice will be qualified to rank with the best journeyman, and to earn the same wages. Those who are over 20 years of age are allowed to finish their apprenticeship in five years, and those who have worked in a shop are advanced according to proficiency. The beginner is first put to drawing from sketches, and then takes up projection and diagrams, and advances regularly according to his ability. It is believed that in this way one year will qualify him as well to work for drawing as four or five years ordinarily. All applicants are taken on trial for from four to twelve weeks, and if not satisfactory they are then dismissed. For the first year's labor five cents per hour is paid; to those under eighteen, six to those who are eighteen, and seven cents to those who are twenty and upward; for the next years these rates are advanced to six, eight, ten, eleven and twelve cents. The firm also pay two cents per hour additional into a reserve fund which is paid to those apprentices who finish their full term of service; for the six years this amounts to \$400.

There are already more applicants for apprenticeship than the firm can accept. Many trades are being left without good workmen, owing to failure to serve an apprenticeship. The Springfield experiment, if found to work well, may be the means of arousing needed attention to this necessity and advantage of boys learning their trades before they start out as journeymen.

**ARIZONA COPPER.**—Messrs. Hyatt, Dunphy & Foa sold yesterday to Messrs. Swift, Christopher & Sevenoake the Apache, Midas and St. Nicholas copper mines, lying on the easterly slope of the Santa Catalinas. The consideration paid was \$50,000. These mines show a large amount of high grade ore, the ledge in one cut being over 15 ft. in width. Fuel and water are abundant in the vicinity. Charcoal can be delivered at the furnaces for 15 cents per bushel. This fact gives these mines a great advantage over the other copper mines of Arizona. The great drawback to successful copper smelting in other districts has been the high price of fuel. At Bisbee charcoal is hard to obtain, and English coke is used in its stead. This coke is \$65 per ton laid down in Bisbee, making the cost of smelting, for fuel alone, of one ton of copper ore amount to \$11. With charcoal at 15 cents per bushel the cost for fuel is about \$5.50 per ton, thus showing a difference of 100 per cent in favor of the Santa Catalina mines as compared with those of Bisbee. Other advantages, such as proximity to the railroad, and good natural roads, exist, and there is no reason why the successes of Bisbee should not be repeated in the Santa Catalina mountains. The new owners are men of energy and capital and the mines will be energetically worked.—*Arizona Mining Journal*.

**A GREAT MINERAL REGION.**—Esmeralda county, Nevada, and Mono and Inyo counties, California, embrace within their limits the most promising mineral region within the United States, and now seem destined within the next eight or ten years to have a population of from 80,000 to 100,000 people, and to add from \$50,000,000 to \$100,000,000 annually to the wealth of the world. There are now 15 organized districts and a vast area of almost unexplored mineral ground within this county. Of these districts, Bodie, Spring, South Bodie, Buckeye, Jordan, Homer, Tioga, Laurel Hill and Mammoth have already made important developments, while most of the others have surface prospects equal to the best of these at the same stage of development.—*Bodie Free Press*.

**WHAT COULD BE DONE.**—The Bodie tunnel and Bechtel could keep 20 stamps supplied with ore for an indefinite period of time; the Con. Pacific and Boston Con. could easily supply 10 stamps; the Concordia and Oro could supply 10; the Belvidere and Jupiter could supply 10; the Goodshaw and Addenda could supply 10; the Bodie 10 and the Standard 50 more stamps than they have, and the Noonday will shortly start 10 additional stamps. The 10 additional in Noonday will increase the aggregate number of stamps in the district to 144, and yet steady employment could be given to 120 more—if the mines named be worked to their full capacity.—*Bodie Press*.

It has come home to the people of the Comstock quite forcibly of late and partly, at least, from the ominous stillness in the market, that "the powers that be" are not at all anxious these days for a boom in stocks or for an unwarranted increase in the value of securities. If they were, Comstock shares are so well held that they could unquestionably secure it. An order to buy a thousand shares of each of the north end stocks would about double the price of them all.

## USEFUL INFORMATION.

**PRESERVATION OF MEAT BY DEXTRINE.**—In the *Comptes Rendus* of the French Academy for December 6th, there is a note by M. J. Seurs on some experiments made by him in drying and preserving meat by means of dextrine. Of the three specimens exhibited before the Academy the first was a slice of lean meat which had been buried in dextrine and left exposed to the air on a shelf in a closet for 20 months. The meat has been mummified; but on putting it in water, it separated from the dextrine and assumed its original physical character. The second was meat which had been chopped up coarsely and mixed without any particular care with dextrine, so as to obtain a thick paste. This paste was dried in this air, and retained its properties like the former. The third was meat beaten to a fine pulp with dextrine and run into a mold, the result being a very hard, dry, homogeneous cake of a handsome appearance. Each of these specimens when exhibited had been preserved for the same length of time—20 months.

**SECURING GLASS IN SKYLIGHTS AND ROOFS.**—A recent English patent shows what seems to us a very convenient and reliable way of fastening sheets of glass in skylight frames of either wood or iron. In the case of a wooden rafter a piece of sheet lead is cut three and one-half times the width of the rafter, laid across the rafter, projecting equally on either side, and nailed at intervals. The lead is then doubled back over the heads of the nails to the center of the rafter on either side and turned up at a right angle. The glass is then laid and the lead, turned down over the face of the glass so that when finished the lead covers the glass the same width of the rafter. If iron is used for a rafter the lead is doubled under the edge of the T instead of nailed, as in the case of wood, and in all other respects handled just the same as with wood.

**TESTING DRAIN PIPES.**—A writer in the *Ironmonger*, from long practical experience in testing drain pipes, confidently recommends for that purpose what he terms a "smoke test;" and which gives evidence as to leaks both to the sight and smell. The materials that he employs are soiled cotton waste and sulphur, the smoke from which, after ignition, is blown into the drain or pipes. If leakage exist in the latter inside of the house the smoke and smell both issue forth and show that something is wrong, and generally tells just where the fault or faults are. Sulphur, as is well known, is one of the best of disinfectants, and a dose of the fumes from this to the drains, after disease has been in the house, would effect much good.

**RUBBER HARNESS.**—Rubber saddle girths are made of gum elastic or other webbing, with a spring of perforated elastic compound, about two inches in length, inserted either about the middle or at either end of the girth. The springs are varied in length, according to the thickness and the width of the web. By the use of this girth the saddle is made more secure from turning, as the girth may be drawn very tight without inconvenience to the horse. Surcingle are made either of woven web or perforated felt, like saddle girths, only about twice their length.

**TO MAKE JAPANESE LACQUER.**—Melt 50 lbs. of Naples asphaltum and 8 lbs. of dark gum anem; boil for about two hours in 12 gallons linseed oil; then melt 10 lbs. of dark gum amber and add driers. Boil for about two hours, or until the mass when cooled can be rolled into little pellets. Withdraw the heat and thin down with 30 gallons turpentine. During the boiling the mass must be constantly stirred to prevent boiling over.

**LUMINOUS PRINTING INK.**—A new invention is reported from Turin. It consists in the application of light-giving materials to printing ink, by which print becomes luminous in the dark, so that in future it will be possible to read at night, in bed or during a journey, without the assistance of candle or lamp. A new daily paper in which this luminous material will be used is, it is said, about to be published at Turin.

**LEGHORN HATS ARE WHITENED** (otherwise than with the fumes of sulphur) as follows: Immerse in a strong aqueous solution of sulphite of soda or bleaching powder (chloride of lime), and then in dilute sulphuric acid (acid 1, water 5). The bleaching powder treatment requires much subsequent washing, or the use of an antichlore dip, hyposulphite of soda dissolved in 20 parts of water.

**CEMENT FOR AN AQUARIUM THAT WILL NOT CRACK OR PEEL FROM GLASS OR GALVANIZED IRON.**—Take by measure, 10 parts of litharge, 10 parts of plaster of Paris, 10 parts of fine, dry white sand, and 1 part finely powdered resin. When wanted for use, mix into a stiff putty with boiled linseed oil. Do not use the tank for three or four days after cemented.

**COTTON AS A BUILDING MATERIAL.**—Even so inflammable a material as cotton can now be used for the construction of fire-proof buildings. It is converted into a paste by chemical treatment, which becomes as hard as stone. It is molded into large slabs and designated as architectural cotton.

**REMEDIES FOR BOILER SCALE.**—The following are a few of the remedies for scale in boilers recommended by various authorities: Potatoes, one-fifth of weight of water, prevents adherence of scale. 2. Twelve parts of salt, 2½ parts of soda, one-eighth extract of oak bark, one-half part of potash. 3. Pieces of oak wood suspended in a boiler and renewed monthly prevent deposits. 4. Two ounces of muriate of ammonia in a boiler twice a week prevents incrustation and decomposes scale. 5. Coating of three parts black lead, 15 of tallow, applied hot to the inside of a boiler every week, prevents scale. 6. Thirteen lbs. of molasses, fed occasionally into an eight-horse boiler, prevented incrustation for six months. 7. Mahogany or oak sawdust in limited quantities. The tannic acid attacks the iron, and should be used with caution. 8. Slippery elm bark has been used with some success. 9. Carbonate of soda. 10. Chloride of tin. 11. Spent tanner's bark. 12. Constant blowing off.

**PHOSPHORESCENT FLOWERS.**—French manufacturers have a very simple method of preparing the phosphorescent flowers, which are commencing to attract so much attention abroad. They are rendered luminous by coating the petals with transparent size, and then dusting them with a phosphorescent substance, such as Canton phosphorus (sulphide of calcium) or Bologna phosphorus (sulphide of borium), the first named being considered the best, and yielding a soft yellow light. According to M. Becquerel, a good quality can be made by mixing 48 parts of flowers of sulphur with 53 parts of calcined oyster shells, and raising them to a temperature of between 800° and 900° C. Exposed to sunlight during the day, the flowers become brightly luminous at night.

**PATINA.**—An imitation of patina for bronze objects of all kinds can be produced by preparing a paint of carbonate of copper and any light alcoholic varnish, and applying it to the object with a brush. This green color penetrates the smallest recesses and has, when dry, the appearance of patina. Carbonate of copper gives a blue patina, verdigris a light green, and intermediate shades of color can be obtained by mixing the two.

**IODINE.**—The best weeds from which to make the ashes for the extraction of iodine are said, by Dr. Thierclain, to be two varieties of the fungus digitaria. He has succeeded in obtaining from the plant 3% of iodine.

## GOOD HEALTH.

## Odor from the Feet.

The odor of pure perspiration is not unpleasant, as may be proved in clean and healthy babies. When, however, the other eliminating organs—those that strain the waste matter from the blood—do not duly perform their functions, their work is attempted by the skin. Then a disagreeable odor is generally given to the perspiration. Even in these cases, the odor is produced mainly after the perspiration has been absorbed by the clothing.

This last fact is generally true of the bad odor which is associated with the excessive perspiration of the feet of some people. Dr. Geo. Thin, of England, has been investigating the matter, and has communicated the results of his experiments to the Royal Society.

The perspiration of the body is generally slightly acid. That in the soles of the stockings and boots he found to be alkaline. In this there is a rapid development of a class of bacteria (microscopic vegetations) characterized by a fetid smell (*bacterium fetidum*). The fluid in the soles of the stockings and of the boots examined by the doctor was found to teem with them. Thus the odor is supposed in some cases to be due, not directly to the perspiration as it comes from the feet, but to its subsequent putrefaction.

The afflicted will be glad to learn that this odor can be wholly destroyed by horacic acid—the acid of boron. The stockings should be changed twice a day. When taken off, they should be placed for some hours in a jar containing a solution of the acid. They are again fit for use after drying.

To prevent the odor from getting into the boots, cork soles should be worn, and placed at night in the jar and dried the next day. Washing the tender and core parts of the feet with the acid will relieve the accompanying feeling of heat and pain.—*Hall's Journal of Health*.

**A LEG AMPUTATED BY ELECTRICITY.**—A very interesting operation was performed in the Toronto General Hospital a few weeks ago. It consisted of amputation, by means of electricity, of the left leg at the hip. The patient, a young man, being reduced very much by the sloughing of an open wound on the outside of the leg, it was desirable that he should lose as little blood as possible. Having placed the patient under the influence of ether, the customary flaps were made, and then a platinum wire, attached to the two poles of a galvanic battery, was encircled round the leg under the flaps. In a moment this wire was brought to a white heat, and began to cut its way through the limb. By the great heat the ends of the arteries were contracted, and only the larger ones required to be tied. Many of the leading surgeons of the city and a large number of the students from both schools were present.

**SUGGESTIONS CONCERNING LONG LIFE.**—If anyone could furnish the world with a medicine which would insure a long life, there is no end to the demand he would have for his drug. The *Herald of Health* thinks he would need many factories to make it, and many banks to hold the money he would receive. Fortunately, there is no such medicine, and so the world will have to get along in some other way. Some time ago the French government sent a circular letter to all the districts of that country to collect information as to those conditions of life which seemed to favor longevity. The replies were very interesting, but on the whole rather monotonous; and the general result is that longevity is promoted by great sobriety, regular labor, especially in the open air, short of excessive fatigue, easy hours, a well-off condition, a philosophical mind in meeting troubles, not too much intellect, and a domestic life. The value of marriage was universally admitted, and long-lived parents were also found an important factor. A healthy climate and good water were mentioned. All this agrees with common sense, unless the idea that the intellect is a hindrance to longevity be considered unreasonable, and we know that some of the most intellectual men have lived to great age.

**SMOKER'S CATARRH.**—Habitual smokers are notoriously liable to colds in the head, and bronchitis and other congestive affections of the air-passages. On this subject Dr. J. F. Rum-bold says: "The congestion occasioned by the action of tobacco on the mucous membrane of the superior portion of the respiratory tract resembles, in many respects, the congestion resulting from the effects of a cold, and, like the effects of a cold, some of its effects are transitory and some are permanent. The local effect of tobacco on the mucous membrane of the nose, throat and ears is as predisposing to catarrhal diseases as inefficient and insufficient clothing in the case of females. The local effect of tobacco on the mucous membrane of the superior portion of the respiratory tract causes a more permanent relaxation and congestion than any known agent. As tobacco depresses the system while it is producing its pleasurable sensation, and as it prepares the mucous membrane by causing a more permanent relaxation and congestion than any known agent—to take on catarrhal inflammation from even slight exposure to cold, it should require no farther evidence to show that its use ought to be discontinued by every catarrhal patient.—*British Medical Journal*.

**NICOTINE POISONING.**—A rather unusual case of poisoning by nicotine has occurred lately in a Paris suburb. The victim, a man in the prime of life, had been cleaning his pipe with a clasp knife; with this he accidentally cut one of his fingers; subsequently, but as the wound was of a trivial nature he paid no heed to it. Five or six hours later, however, the cut finger grew painful and became much swollen; the inflammation rapidly spread to the arm and shoulder, the patient suffering such intense pain that he was obliged to betake himself to bed. Medical assistance was called, and the ordinary remedies proved ineffectual. The sick man, questioned as to the manner in which he cut himself, explained the use to which his pocket knife had been applied, adding that he had omitted to wipe it after cleaning the pipe. The case was now understood, and the patient's estate becoming alarming he was conveyed to the hospital. There the doctors decided amputation of the arm to be the only hope of saving the patient's life, and this was immediately done.

**INFECTION FROM MOSQUITOES.**—The discovery that mosquitoes carry filaria in their probosces, and infect the human subject with that much-dreaded worm parasite, has attracted considerable attention among the English microscopists. The matter has been brought before the Quekett Microscopical Club by Dr. Cobbold, the President, who is one of the highest authorities on this subject. Particulars of various cases were given in which it was proved that those suffering from filaria had received the contagion from mosquitoes, and mosquitoes themselves infected with filaria were shown. Filaria are very minute worm-like parasites, which, on entering the human body, breed until they increase to countless numbers. By recent advices we learn that they have the power of entering and leaving the blood at pleasure; they usually invade the circulation about seven o'clock in the evening, and increase until about midnight, after which time they retire to other parts of the system.

**PETROLEUM IN BRONCHITIS.**—In a communication to the *Gazette des Hospitaux*, Dr. Mouhe gives his experience of petroleum capsules in simple and chronic bronchitis. This balsamic had been brought before the Therapeutic society by Dr. Blache, a year ago, at the suggestion of a Paris chemist, who named it Gabian oil, in order to prevent public prejudice. Each capsule contains twenty-five centigrams of pure petroleum, the ordinary oil not being used, as it has to be distilled in contact with sulphuric acid to render it fit for lighting purposes. It is stated that at the Hospital Beaujon, where these capsules have been freely ordered for chronic bronchitis, a rapid diminution of the secretion and of fits of coughing has been observed; and in tuberculosis, also, the medicine has given encouraging results.

NEWS IN BRIEF, on page 204 and other pages.

## Business Announcements.

Assessment Notice—Lewis Consolidated Mining Co.

## The Week.

As spring gradually approaches, the migratory miners begin to think of changing their quarters. They do not, like other migratory animals, all go in one direction at one time, but this year come go north and some south. New Mexico, Arizona and Sonora attract south, and Idaho and Alaska north. New incorporations for working mines in Alaska are becoming numerous.

We mention elsewhere an event which is of interest to the mining community, viz.: the change in the chief of the U. S. Geological Survey.

The Governor has issued a proclamation calling an extra session of the Legislature.

The event of the week in mining circles is the connection of the south branch of the Sutro tunnel and the Yellow Jacket north drift. As soon as the drain boxes are in, the big pumps of the Yellow Jacket will start up and new life will at once be given to all the mines of that part of the Comstock. The Belcher and Crown Point companies may again resume operations on their lower levels, and the Imperial and adjoining companies may begin to do something besides pumping.

It will probably take some time to repair the deepest workings of the Belcher and Crown Point mines, as it is but fair to conclude that there has been more or less caving, but in a few weeks they will doubtless be going ahead as usual.

As for the heat that will be left in the lower levels after the water has been drained off, it will soon pass out, once a free circulation of air has been established. Air blown into the main drifts will greatly assist in the cooling-off process.

## The United States Geological Survey.

Clarence King has resigned his position of Director of the United States Geological Survey, and Major J. W. Powell has been appointed by the President to fill the place.

This action of Mr. King's is somewhat of a surprise to his friends and to the public, in view of the fact that there was so much rivalry between that gentleman and Mr. Hayden to obtain the Directorship, and that so short a time has elapsed since Mr. King was appointed.

It will be recollected that there were formerly three surveys in charge respectively of Capt. Wheeler, Dr. Hayden and Clarence King. Each of these surveys was doing work entirely independent of each other, although they were all employed with pretty much the same objects in view. When it was wisely resolved to consolidate the surveys under one head Mr. King was appointed director, a position he was eminently qualified to fill, by education, experience and choice.

The organization of a work of this character was alone something that required experience. The elaboration of details was necessarily left more or less to subordinates; but a shrewd general management and careful supervision of matters was requisite. Mr. King, in organizing his parties, pursued a different course from what has usually been done. They are made up largely of young men. He concluded that young men would do more work, and he more ambitious to excel than older ones, and that he could train them to do their work in the manner that he wished it.

The parties, under the new order of things, have been in the field for over a year now, but as yet none of the results have been published. Several volumes are in preparation, which will be extremely useful to mining. That Mr. King should give up his work after getting it so well under way, but before the publication of results, seems strange. It is understood, however, that the private business of "experting" is much more lucrative to him than the directorship of the Survey, and that he will again follow his profession of mining engineer.

It is pretty well known that Mr. King nominated his successor, a choice that will be welcome to all who know anything about the Survey. Major Powell is an indefatigable, energetic explorer, with special knowledge and experience fitting him for the task. A very entertaining writer, he possesses a faculty of making interesting reading of facts, which presented by others might be dry and dull. A ready, and really eloquent speaker, by the way, Major Powell can always interest an audience, as he showed when called upon at the Academy of Sciences last year.

It is not probable that the personnel of the survey will be changed to any extent by Major Powell. Mr. King did not choose his associates haphazard, but carefully selected them. In fact there is less of "political preference" exhibited in this survey than in any branch of the public service, and it has already attained an enviable distinction in respect to the gentlemanly character of those connected with it. Major Powell is keenly alive to the interests of science, but will not on that account neglect the more practical points involved in his work. He will no doubt continue the work of collecting facts concerning mining and metallurgy so well commenced by Mr. King, in a thorough manner. Major Powell, like Mr. King, has a hobby, and in this case it is ethnology, but he will not let his enthusiasm in this direction carry him away from the general work of the survey. He was the first one to take a party down the Colorado canyon, and his book describing that trip is one of the most popular of Government reports. He is familiar with Indian manners and customs, and has made a study of the red men and their languages. Altogether the people may congratulate themselves on the excellent choice that has been made for director of this survey.

**A HUGE DOCUMENT.**—Messrs. Belcher, Mastick & Belcher, attorneys for intervenor, in the case of Pacific Mining Co. against Empire Mining Co., recently decided in the Superior Court of this county, in favor of plaintiff for \$71,000, have just filed their statement on appeal. It is by far the most voluminous document of the kind ever filed in the law courts of this county. It consists of four volumes, substantially bound in two books, the whole embracing about 2,500 pages, partly written and partly printed. The intervenor, which is the Merchants' Exchange Bank of San Francisco, propose contesting the judgment before the Supreme Court, and the volume filed embrace the points upon which they rely for a reversal of the judgment. The statement is subject to amendment by the opposite counsel, after which it has to be settled and allowed by the Court.—*Amador Ledger.*

At a recent annual meeting of the Chollar mining company, 32,000 shares were represented, and the old Trustees were retained. At the organization of the Board, the old officers were re-elected as follows: A. K. P. Harmon, President; C. L. Weller, Vice-President; W. E. Dean, Secretary; Isaac L. Requa, Superintendent. The total receipts for the year, including \$23,600 cash at the beginning, were \$144,100. The disbursements were \$113,500, leaving \$30,600 cash on hand at the close of the last fiscal year.

## Academy of Sciences.

The meeting of the Academy was held on Monday evening, Professor Davidson in the chair.

Capt. R. W. Simpson made an interesting statement detailing his efforts to acclimatize the *Zizania aquatica* or wild rice, which grows so plentiful in some ponds, lakes and rivers of Canada, extending north to Mackenzie river nearly to within the Arctic circle. It grows annually from seed, and induces the presence of enormous flocks of wild fowl in the autumn, who visit these rice lakes and extensive bays for food. At Lake Eris, it grows in water six to eight ft. deep, and millions of reed-birds, as well as ducks and other water fowl, resort there, and afford very fine shooting. Sportsmen's clubs East are taking means to extend its growth, as it attracts game of all kinds. In Rice lake, where it grows prolifically, it has been cut before seed-time, by manufacturers, who find its fiber, taken from the under surface of the water to a depth of six or seven ft., to be very valuable. It affords the strongest kind of fiber known for making bank-note parchment paper. The Canadian government are now trying to cultivate and stimulate its growth all over the inland waters of the Dominion. Two friends of Capt. Simpson's have each sown 30 bushels of this rice seed, in Wales pond, in Maine, and he desires to call attention to it, as an element likely to prove very useful in improving the shooting in our State, and as such, capable of contributing largely to increase our food supply. Different varieties of it are known, but they all belong to one single species, varying according to climate and location. Capt. Simpson had tried to make it grow in Oregon and California but had failed. He now learned that the seed needed first to be soaked in luke-warm water.

## Grape Rot and Grape Pests.

Dr. H. W. Harkness presented some grape pests, found in the eastern part of Sacramento county, which affects the vines, and he thought induced the grape rot. Its spores grow in autumn and are discharged in March. These are followed by a second generation of *aspharia*, which, in some mysterious way, proves to be coincident with the appearance of the grape rot. Each receptacle contains enormous quantities of spores, not one in a thousand of which seems likely to find conditions such as are necessary to its mature development.

## Earth Fungus as Food.

Dr. Harkness then exhibited colored drawings of a new species of earth fungus, first discovered in Golden Gate park by Mrs. Dr. Mary Curran, if to be had in quantity, would prove a valuable article of food. He called it the *Ocaviana*. Its spores are distributed under ground, in the same manner as those of the famous luxury called truffles. He said he had hunted annually for 15 years under the small oak groves of California, hoping to discover truffles, which in Paris are eagerly sought after as a great delicacy, and sell readily there at \$4 a pound. French ecientists with whom he has conversed assure him that our State has conditions which convince them that they will undoubtedly be found here, when a large number of observers are trained to hunt for them systematically. In Europe they are often rooted up by hogs, who are very fond of them, and have a remarkable faculty of finding them. They grow just under the surface, within four or five ft. of oak trees, in fields, and are highly esteemed by epicures the world over. Mr. Clayton, now in Sonoma, once found some red truffles, not the genuine variety, but a very good article of food, and a fair substitute, among the foothills around Santa Clara, and off a little from San Jose. He had himself dug up some interesting earth puff-balls at Roseburg, and found them edible and quite good for a fungus. Feeling confident that truffles exist on our coast, he recommended farmers engaged in grubbing around oaks, to hunt for them especially, and try and recognize them, for thus they could add a new industry to our State, and increase the value of their farms. Capt. Simpson recommended hunting among the heavy oak forests of Oregon and Willamette valley.

## Fungoid Parasite.

Dr. H. Herman Behr then read a paper detailing his observations on a fungoid growth affecting the roots of grape vines, which had suffered from phylloxera. Dr. Harkness has found this same parasite on the orange and oak trees. It is only found on the roots of grape vines which have been punctured by the phylloxera, whose attack appears to prepare the vine for the development of this fungoid parasite. The invading fungus destroys the insect pest, and vines live about three years afterward, bearing fruit somewhat. Dr. Behr thought that the wild grape vines having deeper roots, with greater natural vitality and recuperative energy than cultivated ones, were rarely, if ever, killed outright by the phylloxera. The habits and conditions necessary to develop the winged phylloxera are little known. Never attempt to clean up infected vineyards by pulling the vines out of the earth and inspecting them, as thus you only aid in spreading the pest, which has been distributed by birds among whose feathers they have been found. Prof. Davidson gave notice that he had two 25-ft. pendulums, in the hands of instrument makers, being adjusted, and that in one or two meetings he would have them hung in the Academy's hall, and he would use them to illustrate the effect of the rotation of the earth.

## The Mechanic's Fair.

The Board of Directors of the Mechanics' Institute held a meeting on Tuesday evening of this week, President Cornwall in the chair. After a lengthy discussion it was unanimously resolved to hold an exhibition at the Pavilion this year, commencing on the 2d of August and closing on September 3d. This is expected to be the last exhibition to be held in the present building.

It was resolved not to offer any premiums for exhibits. This, however, was subsequently modified, so as to allow of the offering of one premium—an institute's gold medal for the California invention which shall be decided by a committee to be the most useful to the greatest number of people.

Mr. Gilmors, who has hitherto superintended the different exhibitions, was appointed Superintendent. He will shortly issue a circular, giving full information relative to the fair.

Mr. Culver will be the Secretary. The gentlemen under whose management the fair will be held are: P. B. Cornwall, President; Vice-President, Starbird; Treasurer, J. A. Bauer; James Drury, George Spaulding, George Hopps, Asa R. Wells and Messrs. Spiers, Fretwell, Wilcox, Dinsmore, Gray and Waterhouse.

In announcing thus early the date of the exhibition, ample time is given to all persons to prepare an exhibit. It is to be hoped that our manufacturers will this year be prompt in coming forward, and will vie with each other in efforts to make the most creditable display.

It will be a great satisfaction to the people of this city to see represented at this fair all the various kinds of manufactures carried on here. We all recognize the fact that we have not manufactures enough for so large a city, yet there are more of them here than most people imagine. Were each industry of the city to be well represented, people could see what our capacities were, and it would encourage others to establish new industries.

Were it not for these fairs held under the auspices of the Mechanics' Institute, half of our industries would scarcely be known outside of business circles. They give an opportunity each year for our manufacturers to exhibit to their customers what progress has been made in their particular branch, and to display their goods in an attractive way to the people who purchase them. We hope that this exhibition will be all that is hoped for, and in order that it shall be, earnestly urge upon intending exhibitors speedy and careful preparation.

## An Oscillating Concentrator.

Joseph Snyder, of Nevada county, is having made at Joshua Hendy's, in this city, one of the oscillating concentrators similar to that which he has at work at the Godfrey mine. The new one will, however, be much superior in construction, and will be exhibited in operation as soon as completed. The machine has a slow, oscillating motion, with no jar. There is no limit to its work, as it can be made of any desired size, large or small. Another feature is that it can be used in connection with undercurrents in gravel mines. The editor of the Grass Valley *Tidings*, who has seen the machine at work at the Godfrey mine, beyond Alta Hill, believes it is destined to work a revolution in the saving of sulphurets and black sand, together with floating amalgam and gold.

The concentrator is thus described by the *Union*: Within a wooden framework about nine ft. in length, by six in width and six in height, are placed, one above the other, two wide wooden platforms, having a slight inclination from their outer ends toward the center. These platforms are so geared by machinery that as the water is turned on, they have a slow, rocking motion, which causes the tailings that are poured in by a sluice on the upper platform, to spread out and run in a thin sheet, backward and forward, and as the sands are the lightest, they gradually discharge over the ends of the platform, while the black sands or sulphurets settle to the center or lowest point, and are discharged slowly through holes on to the lower platform. By the time the tailings reach the lower platform they are nearly freed from the sands, and the black sand and sulphurets, when again discharged through the holes in the center of the lower platform, are received into a box almost as entirely free from sand and tailings, only a trace being seen. It is impossible to describe the various attachments of the machine that conduct its working, but they are all simple and will so regulate the operations as to make the platforms rock at the desired speed, which should not be more than four oscillations per minute. The machine is driven by a small stream of water, but little power being required, and is entirely automatic in its working, and requires no attention whatever, unless it would an occasional inspection to see that nothing was out of order. The present machine takes all the tailings from two 4-stamp batteries, which run through from 50 to 60 tons of gravel daily, and it is estimated that it would do the same service for three 5-stamp quartz batteries.

The Enreka Con. dividend of \$25,000 was paid this week.

## Adverse Claims and Mineral Surveyors.

In this State and elsewhere a species of black-mailing has prevailed to a certain extent under the provisions contained in Section 7, of the mining act of May 10, 1872, relative to adverse claims, or more particularly under Regulation 49 of Mining Laws and Regulations (Coppe's U. S. Mining Decisions, page 235), which permits U. S. deputy mineral surveyors to survey an adverse claim, and certify to the correctness of the plat, to be filed by the adverse claimant. No matter if the record of location was vague and indefinite, it was enough for the purpose of the adverse claimant if he could secure an adverse survey, file his plat in the land office, and through the threatened delay in proceedings, receive a bonus from the parties claimed to be adverse to him.

In one instance, a piece of mining property was on the eve of being bonded while application for patent was pending. An adverse claim was filed, and the owners, rather than submit to the delay of proceedings attending an adjudication of the case, paid the adverse claimant the sum of \$5,000 to withdraw his claim.

This evil was growing and working hardship in many cases, it being in the power of unscrupulous individuals to levy blackmail frequently, where they had no shadow of right to the ground claimed. Theodore Wagner, the Surveyor General of this State, believing that the U. S. deputy surveyors of the district are under his control, and have no authority to act officially except upon direct instructions from the Surveyor General; and believing also that the provisions of the instructions of Nov. 20, 1873, respecting locations, are applicable as well to locations and surveys of adverse claims as to claims for which patent is sought, instructed his deputies to make no surveys, as U. S. deputy mineral surveyors, unless so ordered by him. It was, however, represented to him that such a rule would, in many instances, work as a hardship to bona fide adverse claimants by preventing the filing of their maps in the time allowed by law, especially where the claims were located in remote localities, and he modified the rule, and issued a circular to surveyors to the following effect:

"When an adverse claimant desires a survey of his adverse claim, he must present to some United States deputy mineral surveyor an affidavit substantially in the form herewith inclosed, together with a record of his adverse claim or location.

"The provisions of the special instructions dated Nov. 22, 1879, respecting locations, are applicable as well to surveys to adverse claims as to claims which are sought to be patented. An adverse claim too indefinitely located to entitle it to a survey for patent is not entitled to a survey as an adverse claim.

"The deputy, after making the survey of the adverse claim, will return said survey with the affidavit, diagram, record of location, or, in the absence of a record, secondary evidence of the location to this office, in duplicate, for examination and approval. One copy will be retained in this office and the other copy, if approved, will be sent to the adverse claimant to be filed with his protest in the United States Land Office."

The following is the form of application required from the adverse claimant:

\_\_\_\_\_, being duly sworn, says, that he is a citizen of the United States, over the age of 21 years (or has declared his intention to become a citizen of the United States); that on the \_\_\_\_\_ day of \_\_\_\_\_, A. D. 18\_\_\_\_, \_\_\_\_\_ located a certain mining claim known as the \_\_\_\_\_ mine, and situated upon \_\_\_\_\_ surveyed lands of the United States; that said locator was a citizen of the United States (or had declared his intention to become a citizen of the United States) at the time he made said location; that said claim was located after the discovery of a vein or lode within the limits thereof; that said location was so distinctly marked upon the ground that its boundaries can be readily traced; that the record of said location contains the name of the locator, the date of the location, and such a description thereof as will identify the claim; that said \_\_\_\_\_ is now in possession of said mine, and that a portion of the ground included within the boundaries and forming a part of said mine as located by said \_\_\_\_\_, is included in the official survey of the \_\_\_\_\_ mine, claimed by \_\_\_\_\_, now being published under the provisions of chapter VI, title 32, of the Revised Statutes of the United States.

Subscribed and sworn to before me this \_\_\_\_\_ day of \_\_\_\_\_, A. D. 18\_\_\_\_.

United States Deputy Mineral Surveyor:

SIR: I, \_\_\_\_\_, claimant of the mine mentioned in the foregoing affidavit, do hereby apply to you for a survey of said location and a diagram showing the conflict between said location and the official survey of the \_\_\_\_\_ mine referred to in said affidavit.

\_\_\_\_\_, Claimant.

Since the adoption of this rule, it has been found that many of the so-called adverse surveys were based upon no foundation whatever; that the records of location were so indefinite that the claims could be swung around to any point of the compass and made to overlap any claim coming within several hundred feet of the center of its "lode line," the direction of the lode line being determined by the location of the mine to which it was "adverse." The

deputy making the adverse survey files his survey in the Surveyor General's office in duplicate. It is carefully examined, and, if found correct and based on a sufficiently definite location, is sent to the claimant; the duplicate is retained in the office for filing with the papers in the case of the claim to which it is adverse. Heretofore no record of adverse survey has been kept in the Surveyor General's office, although the necessity of such a record is manifest. The rule has shown itself to be an excellent one.

Section 7 of the act of May 10, 1872, provides that "it shall be the duty of the adverse claimant, within 30 days after filing his claim, to commence proceedings in a court of competent jurisdiction, to determine the question of the right of possession, and prosecute the same with reasonable diligence to final judgment, and a failure to do so will be a waiver of his adverse claim. After such judgment shall have been rendered, the party entitled to the possession of the claim, or any portion thereof, may, without giving further notice, file a certified copy of the judgment-roll with the register of the land office, together with the certificate of the Surveyor General that the requisite amount of labor has been expended, or improvements made thereon, and the description required in other cases," etc.

The requirements that the application must be accompanied by the certificate of the Surveyor General as to amount of labor performed, and the description required in other cases, and in fact all the provisions of the act of May 10, 1872, relating to adverse surveys, point to the supervision of the Surveyor General over adverse as well as other surveys.

## The Miners' Trouble at Silver Reef.

The strike at Silver Reef, Utah, still continues, though the miners have, according to the Salt Lake Tribune, lost \$75,000, and damaged the mines as much more. Much property has been lost by the water flooding the mines. The

THE TAYLOR &amp; BRUNTON REVOLVING CYLINDER FURNACE.

pumps in the Savage shaft (Stormont company) are under water, and cannot be removed from the mine until new machinery has been procured. The Miners' Union is receiving assistance from other unions, and the companies express themselves as being fully determined not to accede to the laborers' demand.

A few weeks ago the miners ordered Col. Allen, Supt. of the Stormont, out of town. This gentleman was interviewed by a Herald reporter on his arrival in Salt Lake, and he accounts for their turning him out as follows: "You see, Gen. Ogden, Supt. of the Barbee & Walker, had also given notice that that company's works would shut down on the 1st of the present month, and remain closed down until such time as the reduced rate of wages should be accepted. I charged the miners with having taken this step for the purpose of preventing this action of the Barbee & Walker company. The reply was, 'If he does close down, we shall serve him the same as we are now serving you, and he, probably, will not fare as well as you are doing.' The fact that the mine was not closed down on the 1st instant is evidence to me that the management considers it good policy to keep quietly at work for the present, or until such time as ample security to life and property is afforded in the district."

The miners have been leaving the camp for other districts. Business is at a standstill, and no one presumes to say when work will begin. We notice by the Tribune of the 18th that about 20 miners have been arrested, but no reason is given.

The action of the miners in driving out the superintendent was injudicious, as he was of course only acting for the company, and it looks too much like "Melly Maguirism" to be countenanced by people of this coast. The owners of mines insist that at the rate of wages demanded, and heretofore paid, the mines will have to close. As the wages are higher than anywhere else in Utah the miners could have better afforded to lose the half dollar a day than to stop work altogether. Commodore Ogden, of the Barbee & Walker, is still at the camp, and does not propose to leave it. It is pretty certain he will look out for the interests of his company without fear or favor. It is to be hoped an amicable arrangement will be made shortly, as disputes of that kind are injurious to both parties.

The Hite gold mine, Mariposa county, Cal., has been worked for about 15 years, has produced some \$3,000,000, and disbursed in dividends about \$1,500,000.

## Revolving Cylinder Furnace.

EDITORS PRESS:—We see mentioned in the Press of Feb. 26th, a device adopted by Mr. Ottokar Hoffman, to equalize the heat, time of roasting, etc., at opposite ends of a revolving cylinder for ore chloridizing. We have known for some years the fact of unequal heating in different parts of such cylinders. The old Bruckner patent tried to cure this defect by shifting the ore from end to end in the roaster.

In a cylinder 12'x46' internal dimensions, the heat in the extreme front or firing end is about twice as great as in the extreme back end, but also in the center of the furnace it is three times as great as in the back end. The fires at both ends will not affect the proportion of heat in the center, but will leave this part 50% hotter than either end.

After many experiments we have not been able to find any way of getting the heat equal throughout the cylinder, but found a very simple method of counterbalancing the inevitable unequal heat and obtaining equal results in all points of the roaster by opposing to the unequal heats proportionally unequal quantities of ore. To do this we change the straight line of the side of the ordinary cylinder into a parabolic curve, thus giving a cylinder at any point a diameter which allows it to contain at the place of such diameter, an amount of ore proportionate to the heat developed at the same place. The resultant cylinder is roughly egg-shaped.

These roasters are made by Messrs. Prescott, Scott & Co. of San Francisco, and will give equal chlorination in all parts of their interior and no lumps. Yours truly,

TAYLOR & BRUNTON.

Leadville, Col., March 12th.

Since receiving the above letter we have prepared an engraving of the furnace referred to, and herewith present it. A represents a roasting cylinder for roasting gold, silver and cop-

per ores. The internal diameter of this cylinder is greater at the center than it is at the two ends, as shown. The discharging door is situated in the center at broadest part of the furnace.

The cylinder is intended to revolve, and for this purpose the traveling rings, C, are secured on the outer surface of the cylinder, and rest on the truck wheels, on which the cylinder revolves. D is the opening for charging.

To give the cylinder motion, power is applied to the pulley on the shaft which revolves an actuating screw on the same shaft. This actuating screw meshes with a worm-wheel on a shaft, and as the screw-wheel is on the same shaft, it is also revolved. The spur-wheel engages with the cog on the gear-wheel, F, on the outside of the cylinder, the cylinder thus being rotated. Self-keyed fire brick, held in place by wedge-shaped rings or clamps, which in turn are held in place by set screws, hold the throat lining in place. To remove the throat brick, the set screws are unscrewed and the wedge-shaped rings removed, when the bricks may be separately removed.

COMSTOCK HOISTING WORKS.—A San Francisco stock paper recently asserted that there were only eight hoisting works on the Comstock in operation. This, says the Enterprise, is a mistake. There are at least 25 hoisting works here where hoisting of some kind is being done. Here is the list: Original Keystone, Utah, Sierra Nevada, Union shaft, Andes, Scorpion, C. and C. shaft, Oshiston shaft, Savage, Hale & Norcross, Combination shaft, Bullion, (formerly the Ward shaft), Imperial, Yellow Jacket, Crown Point, Kentucky, New York, Belcher air shaft, Belcher old works, Overman, Caledonia, Forman shaft, Alta, Silver Hill and Sierra (Devil's Gate). To be sure, at some of them very little is being done, but the works are not shut down. In addition, the pumps and air compressors at the Ophir are kept going.

COPPER IN LIVERPOOL.—We see by Jas. Lewis & Sons report on ores and metals for March, that the market for Chile has been steady, with moderate business. The arrivals during the month of February have been 3,249 tons from Chile and from other countries 2,317 tons and 1,677 tons. Latest quotations are as follows: Good ordinary brands, £61 5s, and £61 10s. Ore, 12s 7½d, and regulus 12s 9d per unit. Stocks of West Coast produce are 32,835 tons fine, against 31,340 tons on the 1st ult.

QUICKSILVER has advanced in Liverpool to 18s per flask,

## Wood River.

Probably no other mining center is at present attracting so much attention as the Wood River range, where there are three different districts. Hundreds of men are preparing to go to Wood River in the spring, and some have already—very foolishly—started, although the snow is yet deep. The interest in this new section of country is widespread, and information concerning it is eagerly sought. As regards the ores an exchange tells us that their character varies in the three districts. There are found cake, galena and carbonates, carrying 60% to 70% lead—sulphurates and antimonial silver running into the thousands. Further up the range the mineral is found in calcareous shale, spar, iron and quartz. All the districts have developed paying mines. The whole region is well watered by Big and Little Wood rivers, fed by streams from every canyon and mountain gorge. The water power is sufficient for mills and mining; the mountains well wooded with forests of red fir and black pine, spruce, etc. This is the country the Bannock Indians fought for several years ago, claiming it as a hunting ground. It is full of game of all kinds—elk, deer, antelope, bear and the lesser spoils of the hunt, grouse and prairie chickens, while beaver, otter and mink abound. The smaller streams are filled with mountain trout, while the river has a seemingly inexhaustible stock of the larger trout. Warm springs are found every few miles. Owing to the elevation—5,500 ft.—agriculture may not prove practicable, but the numerous valleys of the mountains and camas prairies to the southwest furnish the finest grazing country in the world—hunch grass thick as it can grow, and innumerable streams in every direction.

Mr. George L. Lucas, of Albion, Cassia county, Idaho, writes to Mr. Delavan, of Virginia City, Nev. (and the letter is published in the Enterprise), to the effect that at Belleville all provisions and supplies were dear. Irish potatoes, \$5 per 100 lbs.; flour, \$7; oats and barley, \$6, and all else in the same proportion.

This winter has demonstrated that the only practical route is to leave the Central Pacific railroad at Kelton, Utah, thence go by stage or wagon to Albion, Cassia county (called formerly Marsh Basin), thence to Goose Creek, to Bellevue, to Ketchum, to Galena, and thence to Saw Tooth, on Big Wood river.

There will be a large emigration to all those places, as well as to Haleyville, now called Marshall, a new town on the east bank of Wood river, opposite the mouth of Croy's gulch, where a bridge has been built. This bridge gives access to a region in which are many of the best mines, without danger of mishaps from high water, for it is a truth that all the mountain streams are swift and very dangerous to ford when the water is high.

From Goose Creek Haley & Co. have a contract for six mails each way every week, to run four-horse coaches, and are stocking the road for that purpose. In a few days there will be another road open (said to be shorter and better) from this point, crossing Snake river at Goodwin's bend. The ferries at what is called the Goose Creek crossing of Snake river and at Goodwin's, both have steel cables, making them much safer than when an ordinary rope is used.

Mr. Lucas tells Mr. Delavan to caution all his friends to prepare (if going by team) to take water for at least one dry camp, for there is no water fit for man to drink between Snake river and Little Cottonwood river, a distance of about 50 miles.

It is 60 miles from Ketchum to Albion, thence 18 miles to the Goose Creek ferry (Snake river), 60 miles to Little Wood river, 15 miles to Big Cottonwood (on Big Wood river), 25 to Bellevue, 16 to Ketchum, 25 to Galena, and thence 12 miles to Saw Tooth. Men can go from Kelton to Galena in public conveyances after the snow goes off.

HALE & NORCROSS.—The Hale & Norcross ran its pumps yesterday till 12 m., at which time the clack of the lower pump at the C. N. S. shaft was replaced and pumping there resumed. The Hale & Norcross then resumed the work of putting in pipe from the first to eighth station, which was completed to-day. Work was to be resumed north in the lateral drifts on the 2100 and 2400 levels immediately, or as soon as the hot air in the mine was blown out a little. It was so hot in the depths Sunday night when it became necessary to rig up the pumps, that one man gave out and was left at the C. N. S. shaft, and another got cramps in his hands—a singular effect for heat to produce, especially when, as in this instance, no change in their appearance was noticeable.—Gold Hill News, March 15th.

The Clear Creek ditch property, Shasta county, was sold last week for \$39,379 to Mrs. Georgie S. Jones. The property was sold at sheriff's sale. The main ditch, which takes water from Clear Creek at or near the Towerhouse, and leading to Mule Town, Horse Town, Texas Springs and other places, with its water rights and branches, brought \$30,000. The Halvey ranch brought \$500; the Elmore ranch \$2,227; the Reese mine \$1,500. A number of other small ditches were included in the purchase, the same lady buying it all.

ANTIMONY is selling in Liverpool at £62 to £64 per ton for French star regulus.

### Pahrnatagat to the Front.

Within the past few weeks an enterprise has been quietly inaugurated and vigorously pushed to a successful termination in this district, that is morally certain to prove productive of most important financial results to the entire section. Notwithstanding the inclemency of a severe winter, the stagnation of mining affairs on every side (and the approaching conjunction of the planets), a trio of our practical mining fellow-citizens have, within 60 days from the first inception of the enterprise, erected, and now have in practical operation, a solid, substantial five-stamp mill (with capacity for 10), with self-feeder and all modern improvements; and now, at "Springer's spring," where less than two months since the coyote's mournful howl alone woke the slumbering echo, five heavy stamps are pulverizing the rich ores of the district, pouring its hitherto latent business into the lap of commerce, and thundering defiance to hard times. Mr. Henry Raymond, so well-known in mining circles, and whose name connected with mining affairs, is synonymous with success, heads the enterprise. Perhaps, in the history of mining in eastern Nevada, considering the many obstacles to be surmounted, and the rapidity with which operations have been pushed in this enterprise, there has been no parallel, and to a very great extent this has been due to the mechanical skill and indomitable energy of Mr. Jas. Ryan, whose services Mr. Raymond was very fortunate in securing, and his able assistant, Mr. John Steele. Pahrnatagat rejoices over its new mill. The thunder of its stamps is music in our ear. We are proud of Henry Raymond and his partners, projectors of the enterprise; we are proud of Jimmy Ryan, chief of construction, and of all who have contributed in any degree to its erection. We are proud from the very nature of the enterprise itself. There has been no fuss, and no feathers. It was heralded in by no blasts of trumpets. No metalliferous frauds sojourn to the far East to seduce hoarded shekels from reluctant capital, and no San Francisco chambermaid by hypothecating her clothing to pay assessments. The first "blowing" in connection with this affair was the blowing of the whistle, and the only "music," the music of the stamps; and last, but not least, we have an abundance of ore to keep it going.

It is rumored that Messrs. Chaffee & Sprague are about placing a saw-mill among the big trees of Irish mountain.—*Pioche Record*.

COLORADO's coal mines are a source of wealth to the State. The product last year is estimated at 587,314 tons.

### Business Directory.

### Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arsenurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequalled by any other published embracing the subjects treated. Post-paid, \$7.50. Printed and sold by Dewey & Co., S. F.

AARON'S TESTINO AND WORKING SILVER ORES.—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, \$2. Published and sold by Dewey & Co., S. F.

COPE'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, \$1.00. Sold by Dewey & Co., S. F.

#### A New Edition.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. 1880. A valuable and carefully written work. Postpaid, \$3.00. Sold by Dewey & Co., S. F.

### USEFUL BOOKS

Relating to Casting and Founding, Electricity, Electric Light, Engineering, Drawing, Manufacture of Gas, Heat, Indicator Diagram, Link Motion, Mechanics, Screw Cutting, Slide Valve, Steam Boilers, Steam Engines, Steel, Turning, Wire Gauge, Workshop Receipts. Descriptive Catalogue sent prompt on application.

E. & F. N. Spon, 446 Broome St., N. Y.

## MOREY & SPERRY,

MANUFACTURERS OF

### Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumber-some Stamp Mill and can be put up in one day ready for work.

#### IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one hour of hard quartz that will pass through a 40-mesh screen. The wear is less in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chio Pulverizing Furnaces, Refractors, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply. Iron Work complete for Wood Frames, also

SPERRY'S  
WROUGHT IRON FRAME  
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

## THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

### HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding homastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

### LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for New Prices, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL & CO., Springfield, Ohio,  
and 110 Liberty St., N. Y. City.

PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.

## STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequalled strength, toughness and durability. An invaluable substitute for forgings or cast-iron requiring three-fold strength. Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings. CRANK SHAFTS, SHOES, DIES and GEARING specialties. Circulars and Price Lists free. Address

CHESTER STEEL CASTING CO.,

Works, CHESTER, Pa. 407 Liberty St., PHILADELPHIA

### Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

This paper is printed with ink furnished by Chas. Ensu Johnson & Co., 509 South 10th St., Philadelphia & 59 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorety, 527 Commercial St., S. F.

### THE IMPROVED INGERSOLL

### Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

GEO. R. FOARD, SOLE AGENT,  
No. 18, First St., S. F.

Send for a Catalogue.

### Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arsenurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple or det. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, equipments and working apparatus. It is a work of great merit, by an author whose reputation is well known in his specialty. Price, \$3.00 coin, postage free.

## EXCELSIOR BLASTING POWDER

MANUFACTURED BY THE  
Excelsior Powder Company.

This is no so-called "safety" Powder, but a powerful explosive, and as safe to handle and use as any nitro-glycerine Powder on the continent. There is no headache or nausea in the use of this Powder, as the noxious fumes are entirely done away with. It is put up in cartridges of any size to suit consumers and is exploded with cap and fuse, the same as any other high explosive. The following testimonial is a sample of hundreds of the same tenor being constantly received:

GOLD HILL, August 17, 1880.

AGENT EXCELSIOR POWDER CO.—Dear Sir:—I have used your Powder in test cement and hard blasting rock, and find it superior to any Powder in use on the Comstock. It does its work effectually, and does not leave the person using it with severe headache, like the other Powders do to the majority of miners. In recommending it I would suggest, give it a trial and I am confident it will speak for itself. Wishing your Company success,  
I am respectfully yours, etc.,

GEORGE CLARK,  
Foreman Sierra G. and S. M. Co.

Address all orders to

**Excelsior Powder Company,**  
Room 40, Merchants' Exchange,  
SAN FRANCISCO, CAL.

### New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. PH. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. L. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

## Metallurgy and Ores.

**WM. D. JOHNSTON,**  
[Formerly Chief Assayer with Thos. Price.]  
**ASSAYER AND ANALYTICAL CHEMIST,**  
118 & 120 Halleck Street,

Brass and Steel Wire Screens, Hardware and Fancy  
Goods, Opera, Field and Marine Glasses,  
Optical Instruments, Etc.

No. 521 and 523 MARKET STREET, S. F.

The attention of Assayers, Chemists, Mining and Milling  
Companies is particularly called to the complete stock of  
Balances, Furnaces, Crucibles, Brass and Steel Wire  
Screens, etc., including all the necessities for Assayers,  
and Miners, as also for Milling men. An experience of 30  
years in this line of business enables me to guarantee a  
strict attendance to the orders which my friends may en-  
trust to me. Gold and Silver Tables and a full list of ar-  
ticles to be found in my store, to be had on application.

**BOESCH'S PATENT**  
Hydraulic Mining and Locomotive Head Lights, with the  
Latest Improvements, making them the best and  
cheapest in the market.

**Pacific Lamp and Reflector Factory.**  
569 Mission Street, San Francisco.

**ST. DAVID'S,**  
**A FIRST-CLASS LODGING HOUSE**  
CONTAINS 113 ROOMS.  
715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for  
gentlemen and ladies visiting the city from the interior. No  
dark rooms. Gas and running water in each room. The floors  
are covered with body Brussels carpet, and all of the furniture  
is made of solid black walnut. Each bed has a spring mat-  
tress, with an additional hair top mattress, making them the  
most luxurious and healthy beds in the world. Ladies wait-  
ing to cook for themselves or families, are allowed the free  
use of a large public kitchen and dining room, with dishes.  
Servants wash the dishes and keep up a constant fire from  
8 A. M. to 7 P. M. Hot and cold baths, a large parlor and read-  
ing room, containing a Grand Piano—all free to guests. Price  
single rooms per night, 50 cts.; per week, from \$2.50 upwards.

**R. HUGHES, Proprietor.**  
At Market Street Ferry, take Omnibus line of street cars  
to corner Third and Howard.

Patent Mill and Street Lamps to Burn Coal  
Oil, Naphtha and Gas.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

**WINDOW SCREEN.**—John Reardon, Ione City, Cal. This invention consists of a screen, of any suitable material, secured within a metallic frame, which is adapted to slide upon flanged guides secured to the casings so that the screen may move close to the sash, and move through the entire space, from the top to the bottom, of the window-opening, and so that it may be used as a screen at either the top or bottom of said opening, in combination with laterally-sliding, adjustable guide-pieces and holding-ecrewe, by means of which the screen is made to fit window frames of different widths, the limits to whose dimensions are determined by the length of the slot.

**STRAW-CARRIER ATTACHMENT FOR SEPARATING GRAIN FROM STRAW.**—Jasper S. Scott, San Jose, Cal. This invention relates to certain improvements in devices for separating grain from the straw with which it is mixed and entangled after it leaves the threshing-cylinder and passes up the grain-belt to the straw-carrier; and it consists of a series of vibrating bars having lifting fingers. These bars are set, one just at the lower end of the straw-carrier and the other two beyond its outer end, and they are all caused to oscillate by means of crank-arms, so as to separate the remaining grain from the straw before it passes over the tail-board and is discharged.

**BAKE MILL.**—Herman Kulkman, San Francisco. This device relates to an improvement in mills for grinding bark, drugs and similar material whereby steam is introduced to keep the grinder heated and preventing the bark from sticking and clogging the machine. By the use of this machine the bark may be put into the mill at once without any preliminary drying, thereby saving expense of drying-floors, etc.

**APPARATUS FOR BLUESTONING WHEAT.**—Joseph W. Blevin, Yuba city, Sutter county, Cal. This invention relates to a novel apparatus for bluestoning wheat, whereby the rust, or smut which develops in growing grain, and is produced by foul seed, is prevented. It consists of an inclined trough containing a solution of sulphate of copper, and into which the wheat is conducted, and is carried up through the solution by scoop or buckets to the upper end of the trough, and discharged.

**PLUMB LEVEL.**—Henry Hobson, S. F. The object of this device is simplicity of construction with increased efficiency. It consists of a metal plate set into the side of a common level-block. In this plate are four apertures, having lines drawn through the center of each. A pivoted weight or pendulum is set in the plate. The weight has an arm extending so as to be seen through the apertures.

**WOOL-WASHING MACHINE.**—John T. Davis, San Francisco. This machine consists in a trough provided with a perforated false bottom and a series of revolving beaters which submerge and stir the wool, and at the same time feed it toward one end of the trough, in which there is a series of elevating-rollers which carry the wool to a set of squeezing-rollers, when the water is removed.

**ADJUSTING ATTACHMENT FOR THE POSTS OF POWER-DRILLS.**—C. P. Purinton, Oakland, Cal. This device consists of an attachment for the posts by which such drills are supported, this attachment serving to change the position of the post and the drill, after they have been set and secured in place without the necessity of resetting the post.

**VEHICLE SPRING.**—G. G. Buckland, Tulare, Cal. The object of this invention is to save work and material by simplifying the construction in using no wood for the head-block, nor perches, nor the many iron about the perches and head-blocks in ordinary vehicles, and in providing a better gearing than now in use.

### Chairs and Upholstery.

When we take into consideration the incessant wear and breakage, together with the not unfrequent wholesale destruction of household furniture by widespread conflagration, it often becomes a matter of no little wonder as to whence comes all the chairs and general upholstery that supply our own and our neighbors' houses, to say nothing of the vast quantity used on our river and sea-going craft, and in the public buildings of every town and city in our land. But a stroll through the workshops and ware-rooms of the West Coast Manufacturing Company, would tend not only to satisfactorily settle this question, but it would quite likely lead the observer to wonder, on the other hand, who it is that buys and makes way with all the articles there made. The general reader may be able to glean some idea of the gigantic proportions of this establishment when it is stated that the premises embrace three acres of ground, quite an item of itself to exist in the heart of a city like San Francisco. This factory is located at the corner of Fourth and Bryant streets, the office and sales-room at 432 to 434 Fourth street. The main factory edifice, built of stone, brick and iron, is 635 ft. long by 50 ft. wide and four stories high. The machinery is driven by two steam engines of 150 horse-power each. A saw-mill cuts the lumber from the logs, and a dry-house, having a capacity of 60,000 ft., prepares it for manufacture. An artesian well on the premises furnishes an unlimited supply of pure water. It is estimated this well alone constitutes an economical element to the amount of from \$150 to \$200 per month. There are at present employed in the various departments 107 men and 15 women, the latter being principally engaged in making cane seat work. The goods turned out at this factory comprise everything to be found in a general assortment of upholstery. Chaire, tables, bureaux, children's cribs, and many things accounted sacred to every household, whether of the rich or poor, high or low are made here in such quantities as would seem to imply that forests must be felled to supply a sufficiency of material. All points considered, the proprietors claim the distinction of making the best chairs in the United States. Chamber sets are manufactured by them ranging in price from \$40 to \$500. The woods principally used are walnut, oak, cedar and prima vera; from \$4,000 to \$5,000 worth of lumber being worked up each month. From the condition of uncouth masses in which shape the various woods are imported, they are deftly transformed, almost in a trice, through the agency of adroit manipulation and elaborate mechanism, into the elegant forms which adorn our dwellings, and afford us so much comfort and ease. The excellence of quality, and beauty of design of the work turned out at this establishment cannot be surpassed by anything that is imported from the Eastern States. Not only do the proprietors enjoy a large local trade, but their goods are constantly being shipped to all parts of the Pacific coast, including Mexico and Central America, China and Australia. It is a noteworthy circumstance that orders for this furniture come from so far east as Arizona and Salt Lake City. The West Coast Furniture Manufacturing Company founded this business in 1874, and such has been its progress that it ranks to-day with the foremost industrial enterprises of the world. Altogether, the varied manufactures of San Francisco, like living epistles read of all men, are telling commentaries on our growth and development, and of which our citizens have every reason to feel justly proud.

**WHAT MILL CREEK WANTS.**—An observing gentleman who is tolerably familiar with Mill creek affairs says that "what Mill creek wants is to get up and shake itself, like a mule that has been wallowing in the slough of despond; it wants to stop trying to tear down, and try to build up; it wants to turn out and turn something up, instead of waiting for something to turn up; it wants fewer mining claims to the man, and more men to the mining claim; in fact," concluded the gentleman, "Mill creek wants a good shaking up, for its mines are good and numerous, but its people lack enterprise and dislike to see it displayed by others."—*Bodie Press.*

From a recent issue of the Marysville *Appeal* we clip the following: T. A. McFarland, an old resident of Howland Flat, has returned from San Francisco. He has just sold the Bonanza mining claim and property, located at Howland Flat, to an English company for the sum of \$225,000. Mr. McFarland owned one-third of the mine, and received for his share a check for \$75,000. An undivided one-third interest was owned by Aleck McNey and J. Stone, and the other third by other parties. Mr. McFarland is returning to his home to sell his store and then remove to San Francisco. The purchasing company has an agent in San Francisco, but the home office will be in London.

The *Mountain Messenger*, published by Vaughn & Donner, in Downieville, now in its 28th year, is one of the most prosperous journals in California. It is the third oldest weekly in this State; the *Shasta Courier*, the second, and the *Calaveras Chronicle*, at Mokelumne Hill, the oldest.

THE sash and door-makers of New York demand an increase of wages, or they will strike. Other trades are moving for an advance in wages.

SEVERAL petards were exploded on Saturday night in the streets of Madrid. It is supposed they were directed against the prefect of police.

HARRY GENER, (known as "Prince Hal"), one of the Tweed ring of official plunderers in New York city, was on the 12th instant sentenced to the penitentiary and fined \$6,604.

SEVERAL nuggets of gold have been picked up in different parts of Butte county during the past few weeks. Most of them have been found above ground and uncovered by the recent high water.

It is said at Washington by those who know them, that Hayee could dismiss the cares of office and go to sleep, but that Garfield takes the anxieties of the day to bed, hence loses much needed sleep.

PAYMENTS due from Russian peasants for lands allotted to them on the abolition of serfdom are about to be reduced in 25 governments by 40 to 70%, the total reduction aggregating 9,000,000 roubles yearly.

THE New York Co-operative society opened its first store on Thursday, at No. 7 Clinton place. The stock taken so far amounts to \$5,425, and this is distributed among 217 persons. It is stated that the store will start with a patronage of about 150 families.

GLADSTONE'S strength is giving way. He looks like a wreck of his former self. While speaking in the House he constantly rubs his hands slowly across his forehead, as if suffering from pain or trying to collect his thoughts. The troubles which face him in India, Ireland and the Transvaal weigh heavily.

A GENTLEMAN having an eye to business on a large scale is thinking of utilizing Russian river by tapping it about five miles south of Cloverdale for a water power. He says that a fall of about 175 ft. can be obtained at Healdsburg—sufficient to drive the machinery of a large per cent. of all the present manufacturing interests in the State.

It is claimed that at Iowa City, Miss Hattie Deul, a sister-in-law of Dr. Aylworth, has not eaten a morsel of food for 25 days, nor has she spoken a word for three years. She abstained from food on the ground that it was her religious duty to do so, and from talking for the same reason. The persuasion of her friends is needless, and she is slowly wasting away.

### Claims Against the French Government.

We call the attention of all persons having claims against the Government of France, that we have perfected arrangements for their prompt presentation to the French and American Claims Commissioners now in session in Washington City, under a treaty lately ratified by the two Governments. The treaty provides as follows:

"All claims on the part of corporations, companies, or private individuals, citizens of the United States, upon the Government of France, arising out of acts committed against the persons or property of citizens of the United States not in the service of the enemies of France, or voluntarily giving aid and comfort to the same, by the French civil or military authorities, upon the high seas, or within the Territory of France, its Colonies and Dependencies during the late war between France and Mexico, or during the war of 1870-71, between France and Germany, and the subsequent civil disturbances known as the 'Insurrection of the Commune'; and on the other hand, all claims on the part of corporations, companies or private individuals, citizens of France upon the Government of the United States, arising out of the acts committed against the persons or property of citizens of France, not in the service of the enemies of the United States, or voluntarily giving aid or comfort to the same, by the civil or military authorities of the Government of the United States, upon the high seas, or within the territorial jurisdiction of the United States, during the period comprised between the thirtieth day of April, eighteen hundred and sixty-one, and the twentieth day of August, eighteen hundred and sixty-six, shall be referred to three Commissioners, one of whom shall be named by the President of the United States, and one by the French Government, and the third by His Majesty, the Emperor of Brazil."

The Commission has adopted the following rule to regulate the presentation of claims:

"In addition to the representation of his claim, and the proofs in support thereof which shall have been presented to his Government, the claimant shall file in the office of the Commission a statement of his claim, in the form of a memorial addressed to the Commission."

"No allowance will be made to any person for any share of, or interest in a claim unless he appear as claimant and set forth his interest."

"If a claimant be dead, his executor or administrator, or the legal representatives of the estate, must appear, unless it be shown that there are no creditors, and that the estate is settled."

"If there be a widow of the deceased claimant, she must appear as claimant, or her share will not be allowed."

"If there be heirs, they must appear, unless they are minors under 21 years of age. Minors must appear by guardian or tutrix."

"All persons may be joined as claimants in whom the right to any legal or beneficial relief is alleged to exist, whether jointly, severally, or in the alternative. Any award may be given to such one or more of the claimants as he or they may be entitled to."

"Every memorial shall state the name, residence, and postoffice address of the claimant, and the place and time of his birth, and, if a French citizen, the place or places of his residence between the 13th of April, 1801, and the 20th of August, 1860, and if an American citizen, the place or places of his residence during the war between France and Mexico, the late war between France and Germany, and the 'Insurrection of the Commune.'"

"Parties having claims against either Government, of the character provided for by the treaty would do well to communicate with us at once, as only about four months remain in which such claims can be presented to the Joint Commission for payment."

DEWEY & CO.

### Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

### In the Whole History of Medicine

No preparation has ever performed such marvelous cures or maintained so wide a reputation, as *AYER'S CHERRY PECTORAL*, which is recognized as the world's remedy for all diseases of the throat and lungs. Its long continued series of wonderful cures in all climates has made it universally known as a safe and reliable agent to employ. Against ordinary colds, which are the forerunners of more serious disorders, it acts speedily and surely, always relieving suffering, and often saving life. The protection it affords, by its timely use in the throat and chest disorders of children, makes it an invaluable remedy to be kept always on hand in every house. No person can afford to be without it, and those who have once used it never will. From their knowledge of its composition and effects physicians use the *CHERRY PECTORAL* extensively in their practice, and Clergymen recommend it. It is absolutely certain in its remedial effects, and will always cure where cures are possible.

FOR SALE BY ALL DRUGGISTS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

How to STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

INVENTORS, and others interested, will receive DEWEY & CO.'s MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

## Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St. S. F.

The State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hauks, State Mineralogist.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

### DIVIDEND NOTICE.

OFFICE OF THE

#### Eureka Consolidated Mining Company.

Nevada Block, Room No. 37, San Francisco, March Fifteenth (15), 1881.—At a meeting of the Board of the Directors of the above named Company, held this day, a Dividend, No. Sixty-five (65), of Fifty (50) Cents per share was declared, payable on Monday, March Twenty-first (21), 1881. Transfer books closed until the Twenty-second (22) instant.

P. JACOBUS, Sec'y pro tem.

#### Booth Gold Mining Company.—Location

of principal place of business, San Francisco, California. Location of works, Auburn, Placer county, California. Notice.—There are delinquent, upon the following described stock, on account of assessment No. 3, levied on the second day of February, 1881, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.
L A Booth, trustee.....	34	1,000	\$30 00
L A Booth, trustee.....	35	295	8 85
L A Booth, trustee.....	87	1,000	30 00
L A Booth, trustee.....	119	250	7 50

Geo R Spinney, trustee.....	140	500	15 00

And in accordance with law, and an order of the Board of Directors, made on the second day of February, 1881, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the Auction Rooms of John Middleton & Son, No. 116 Montgomery St., San Francisco, Cal., Monday, the 25th day of March, 1881, at the hour of 2 o'clock, P. M., of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

GEO. R. SPINNEY, Sec'y.

Office.—Room No. 44, No. 314 Pine St., San Francisco, California.

#### Lewis Consolidated Silver Mining Company.

—Location of principal place of business, San Francisco, California. Location of works, Pioneer Mining District, Pinal County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Twenty-third (23) day of March, 1881, an assessment, No. Four (4) of Six (6) Cents per share was levied upon the capital stock of the Corporation, payable immediately, in U. S. Gold Coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Second (2) day of May, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Twenty-third day of May, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. PEW, Sec'y.

Office, No. 310 Pine Street, Room 15, San Francisco, Cal.

## INCERSOLL ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

## MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is usually built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is hoisted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX,  
49 Fremont St., S. F.

## The Californian.

Fresh, Sparkling and Brilliant.

THE CHEAPEST AND BEST MAGAZINE EVER PUBLISHED.

THIS CALIFORNIAN stands in the front rank of magazines. For all matters of interest on the Pacific coast it has absolutely no equal. Every month's issue contains a brilliant collection of essays, stories, descriptions of travel, humor, literature, science, art, political and social science, and is a complete library in itself.

SOMETHING IN EACH NUMBER TO INTEREST EVERY MEMBER OF THE FAMILY.

## BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables and get a good price for them. Go and see the old Reading Grant, (in the upper Sacramento Valley), and you will find such land for sale in subdivisions to suit purchasers—at reasonable rates and on easy terms. Send stamp for map and circular to EDWARD FRISBIE, proprietor, (on the Grant), Anderson, Shasta Co., Cal.

J. H. WYTHE, M. D.

Residence: 965 West Street, Oakland. Office: 759 Market St., San Francisco.  
Before 10 A. M. after 5 P. M. From 11 A. M. to 3 P. M.

### TRUNKS, VALISES AND BAGS.

GO TO MARKET STREET TRUNK STORE,  
632 Market Street.  
Repairing and covers made.

Cups for Engine, Machine and Shaft Bearings and Loose Pulleys. We furnish the Albany Compound (a solid), \$1 worth of which will last as long as \$2 to \$10 worth of Oil, with no stop, and with ONE-TWENTIETH the ATTENTION required by the best Oil Cups. If the Cups are not satisfactory, we will receive them back and make no charge.

Cylinder corrosion is not so much owing to impure tallow or oil as to the fact that these animals do not maintain their integrity under steam heat, but decompose and set free acids which attack and destroy metal.

The Albany Cylinder Oil does not contain fatty acids—is incapable of being decomposed and does not form insoluble soaps. If it becomes mixed with boiler incrustation it diminishes its tendency to cling to the sides of the boiler, and thus exerts in this respect also a beneficial action.

## THE ALBANY Cylinder Oil

The Cheapest and most economical Cylinder Cup. Can be instantly regulated to feed a few drops per minute, and the drops can be counted as they pass through the glass gauge.

Is now in use throughout the world, and we refer to nearly all first-class establishments on this coast for evidence of its efficacy.

## Pure Winter Strained Lard Oil

By every vessel from New York.

## ALBANY SPINDLE OIL.

## Genuine West Virginia Lubricating Oil.

SIGNAL OIL for outside lights of vessels, etc.

The Albany Lubricating Compound and Cups, the Albany Spindle Oil, etc., can only be gotten from us or our agents. Send for catalogues.

Entirely different from other Saws. When dull, sharp teeth, which only cost a trifle, can be inserted in a few minutes, without taking the saw off of the mandrel, and no skill is required in doing it. Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.

## TATUM & BOWEN,

329 Market Street, 3 Fremont Street

## L. P. DECEN.

MANUFACTURER OF

Also Water-Proof Leather Belting.

NO. 13 FREMONT ST., near Market, SAN FRANCISCO

Engraving done at this office.

## DEWEY & CO.,

## American & Foreign Patent Agents.

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

### Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

### Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

### Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

### Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## \$1,000 CHALLENGE!

### THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Save from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of \$1,000 each, and we mean business.

ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

### "FRUE" ORE CONCENTRATORS.

## Mining in Sierra County.

We had an opportunity this week of conversing with Mr. E. K. Downer, of the *Mountain Messenger*, Downieville, Sierra county, Cal., who tells us that the present year promises to be one of the most prosperous ever known in the eventful history of Sierra county. Many new mines are being opened and sold, and a number of partially developed ones have been taken hold of by capitalists who will put them in shape to be sources of profit.

The most noticeable thing which has occurred in this county of late has been the sale of the Bonanza gravel claim at Howland Flat for \$225,000 cash, the money having been paid. This big sale was very quietly consummated. The purchasers are reported to be Scottish capitalists, the agency of the company being here; the principal office, London, England. Three promising adjacent gravel claims were also sold for the sum of \$125,000.

Articles of incorporation of the Forest Queen quartz mining company have been prepared, and will be filed in a few days. Some 20,000 shares have been sold for a working capital, and 10,000 more will be similarly disposed of, the total number being 100,000. Dr. F. M. Biber will leave shortly for Sierra, and as soon as roads will permit the transportation of machinery, a 10-stamp mill will be put up, on the north end of Durgan Flat, at Downieville. A Richman drill is to be used at the mine. Dr. Biber is rapidly perfecting arrangements by which Ohio capitalists will develop some other mines in Sierra.

The Jupiter Consolidated quartz mine, at Goodyear Bar, has been bonded to an English company.

Mr. Downer is interested in the Bald Mountain Extension gravel mine at Forest City, and informs us that the tunnel is in 3,400 ft., 400 ft. of which is fine-looking blue quartz gravel, the top of which prospects in heavy lead gold. It is uncertain yet how far the main tunnel is above bedrock. The future prospects of the mine are encouraging, as it is being demonstrated that the extension of the main lead of the noted Bald Mountain claim comes through the extension ground for three miles, and beyond to Gold Lake. The gross yield of the Bald Mountain for the past eight years has been very close to \$3,000,000, half of which was dividends, on the trifling investment of \$20,000 for opening the mine. The assessments on the claim for the last seven months have been \$1,800 a month. They began to run the long tunnel two years ago last December. It costs about \$5.50 per ft., and up to present time the total cost of locating, patenting, running tunnel, etc., has been over \$30,000. They ran for 1,400 ft. through soft bedrock, only 50 ft. of that distance being in hard rock. Then for a few hundred ft. they met lava, and there they made 100 ft. per month. After that came soft bedrock, succeeded by gravel. They are now running for rimrock, and then intend to come back and sink for bedrock in a good many places, until they are satisfied they have found the center of the channel, and will then start the main tunnel up the ridge, and breast out for pay. The company owns 1,300 acres of ground, and is composed entirely of Downieville men, one of these being Hon. John Weil, State Treasurer. The company is a private one, no stock being for sale. The theory maintained by old miners up there is, that this channel is the extension of the famous Live Yankee channel, which yielded its hundreds of thousands in the palmy days of Sierra.

The Four Hills quartz mine has just been sold to San Francisco capitalists for \$40,000, and it is hoped the mine will prove, when opened, a second Sierra Buttes. A road will be built from Downieville to this mine. Then 17 miles more will connect that town with the Plumas-Eureka mine near Jamison, Plumas county.

They have been running a new tunnel called "No. 8" into the lower part of the Sierra Buttes mine, three miles from Sierra City, in which very rich quartz has been found. This settles the question of its paying well for an indefinite period. At one time it was thought that the mine showed signs of "petering."

## Screw-Hoisting Machine.

We illustrate here with a patent portable double chain screw hoisting works, now being introduced for the first time on this coast by Parks & Lacy. The larger cut is a perspective view, and the smaller ones show sections from which the working parts will be understood. With this machine one man can lift from 250 to 15,000 lbs., according to size of machine. The peculiarity of the appliance is that the chains work at any angle with less friction and more speed, and with very much less power than is usually required. With the medium sizes, 35 lbs. will raise 1,000; and 15 lbs. will lower 1,000.

This load being received on two chains instead of one, it is doubly secure, and the possi-

HARRINGTON'S PORTABLE DOUBLE CHAIN SCREW-HOISTING MACHINES.

bility of slipping is prevented. All the pulleys being at the top of the machine, there is no danger of accident to the workmen, and the load can be raised high. The chains are never under the feet, and as the hoisting chain can be readily removed from the pulleys, the machine is more easily put in place. It works with perfect smoothness under all circumstances. The load cannot rise or fall a hair-breadth, except at the will of the workman; and an exact adjustment of the load is secured.

The working chain is independent of the hoisting chain, and the stretching of the chain does not prevent the proper working of the machine. These hoists are so arranged that they can be run at a rapid rate, either in hoisting or lowering any distance required. They are supplied with an efficient brake, for ease and safety in lowering the load. While the load is being raised with one end of the chain, the other end is descending for a fresh load. With the 1,500 hoist, one man can lift 600 lbs. 10 ft. a minute; with the 1,000 lbs. hoist, 300 lbs. 20 ft. in a minute.

D. A. HILLER has commenced suit in the Superior Court against C. J. Collins, J. C. Bolles et al. and the Equitable Tunnel mining company to restrain them from transferring 16,017 shares of capital stock to defendant C. J. Collins, and to enjoin them from selling 10,250 shares held by plaintiff, on which an assessment is due, and also to compel Collins to pay over \$2,831.26 to the corporation.

## Fraudulent Assessments.

James R. Rogers has commenced suit against Robert Sherwood et al., to recover \$103,800. Plaintiff charges that defendant Sherwood, with the assistance and connivance of Wm. H. Martin, the secretary, levied an assessment as officers of the Scorpion Silver Co., on November 6, 1872, with an intent to defraud M. Eldred, Jr., C. D. Waters and E. A. Waters out of their stock. That there was no need for any assessment, this being the 27th levied. That the defendants knew the company required no funds and levied the one in question when there was no quorum of the directors present, simply to defraud stockholders out of their stock. That on the

31st December, 1872, they sold the stock of the above named parties, amounting to 161 shares in the aggregate. The complaint further charges the levying of assessment 28, of 50 cents per share, in February, 1873, for the purpose of freezing out one Frank Henderson, who held 228 shares of the Scorpion Silver mining company, and one A. Genssy, who held 132 shares of the same, both assessments being unnecessary and fraudulent, the previous assessments not having been paid up by other delinquent stockholders, nor their stock sold. Further, that, to perfect the scheme, on the 31st of December, 1873, said defendants passed an order to sell 10,000 shares of the capital stock, including the stock heretofore described, which defendants bought in through their agents, William Deans & Co. That the stockholders above named only discovered the fraud practiced on them on the 6th September, 1880, since which time they have assigned their rights to plaintiff, James R. Rogers. That the stock, having been divided up from 4,000 to 40,000 shares, could have been sold since for \$20 per share, making plaintiff's interests, of which he claims to have been defrauded, worth \$103,800, for which he asks judgment.

THE New York Central Tunnel railroad company has filed articles of incorporation at Albany, New York. Its object is to run a tunnel from the City Hall at New York to the Grand Central railroad depot.

## Mines of Sonora, Mexico.

The mines of Sonora have been worked from time immemorial. The immense number of old mines that have a history clouded with early traditions prove the ancient character of the mines of Sonora. Some have been known to reach back 100 years, and others have no data to determine the first period in their history. The number of abandoned mines is considerable, some of which were unquestionably exhausted, while others were abandoned on account of the ignorance of the miners on reaching ores that were refractory or hard to work. Right here it might be well to caution American capitalists against buying holes in the ground, solely because, at one period in their history, they had yielded millions.

Most of the abandoned mines, or quite a large number of them, and of the richest, have been ruined by the class of miners of Mexico called "gambucinos," a poor class who had no capital, and were in search of "bonanzas," or rich spots, working these solely, and filling the drifts and shafts behind them with rejected ores and rubbish, so that when they finished a mine it was almost entirely ruined. In some instances, they have extracted the pillars of old mines of great value, and the walls have fallen in, thus doing an incalculable injury to the mines of the State. There is an old Spanish proverb that tersely states: "It takes another mine to work a mine."

This is undoubtedly true of every mine abandoned by these miners. We use strong language on account of the destruction following in the wake of the "gambucinos." The warning of Mr. Mowry to capitalists in his valuable work on Arizona and Sonora, we herewith quote: "As it is desirable that, in the investment of foreign capital there should be no error committed at the outset, than which nothing would retard the progress of this new mining field more; all persons new to the country had better leave abandoned mines alone, unless directed to them by persons long resident in the country, whose character and veracity are undoubted, and who, after the investigation of all the facts, current accounts, and traditions, have full confidence in some abandoned mine or other. There are, undoubtedly, many abandoned mines that are well worthy of attention and outlay of capital, but strangers are not likely to know at once which of the many deserted mines it will be prudent to meddle with. Under the present state of things, the safest investment for new comers will be those mines that have bona fide owners, for, as long as a mine can be worked according to the custom of the country, it is hardly ever abandoned altogether. The owners are fully alive to the value of their possessions, and as they are already in a more or less independent position, and always in expectation of a sudden fortune, they are not anxious to sell unless induced by a fair offer. It is not advisable to enter into any arrangement with Mexican miners to furnish capital to open up a mine, but it is better to buy the whole at once."

CRYSTALLIZED GOLD.—We were shown this week by H. B. Maize, a very curious little gold nugget which he found in a placer claim in Hungry gulch, near Pine Grove, Amador county. The specimen would weigh less than a dollar, and is a perfect pyramid, the base being, however, somewhat irregular. It is apparently a piece of crystallized gold. The faces are perfectly smooth and regular. Such a specimen is exceedingly rare. Close by the spot where this was found Mr. Maize dug up a specimen of gold-studded quartz, showing there is a very rich quartz ledge near by. There are plenty of quartz ledges in the vicinity, but none which show anything like these specimens. They get gold in the dirt of these ledges, but little gold in the rock.

GERMAN TEXT INJURIOUS TO THE EYES.—In view of the opinions lately expressed by eminent oculists, that the reading of German text is injurious to the eyes, the Bernese government have resolved, as much as possible, to discourage its use, and all their official announcements and reports will henceforth be printed exclusively in Roman characters.

## An Improved Steam Pinnace.

A boat of a very novel origin has been successfully tried in the Solent, and submitted to the dockyard officers at Portsmouth for their approval. It was built by Mr. S. White, of East Cowes, and in size, shape, and general construction is almost an exact copy of the 48-ft. steam furnace which has been supplied to the navy for guard and other purposes. The distinguishing feature of the new boat is the manner in which the deadwood and keel have been cut away to the extent of about one-half of its length, by which a free flow of water to the screw is secured. The advantage, however, does not consist in any accession of speed while going ahead, which remains the same, but in a considerable gain to speed in going astern, which it can do as rapidly as ahead, and in the remarkable handiness which the new principle confers in going round.

A very small acquaintance with vessels is sufficient to show that when the helm is put hard over, the stem of a boat makes but little forward progress, but is made the pivot upon which the stern revolves. As the stern is invariably more deeply immersed, the result is that, in turning, the craft is compelled to force back a wall of water, which retards the boat in going round, throws great strain upon the rudder and the gear, and increases the work of the engines. In cutting away the deadwood, the resistance of the water is reduced to a minimum, as it escapes under the quarter, and the pinnace was found on trial to turn a complete circle under full power in one and a half of its whole length.

The new design also enables the craft to stop almost dead, its way being arrested by a supplementary rudder, which is placed abaft the screw, and is worked simultaneously with the ordinary rudder outside. By placing this rudder at right angles with the keel, it acts as an effectual brake, and arrests the way of the craft. It was feared that the reduction of the depth aft would have the effect of diminishing the stiffness of the pinnace in turning, but practical tests have proved that the difference is scarcely appreciable. The great drawback which has hitherto attached to torpedo craft is the size of the circle which they require in turning, a defect which has been partially remedied by fitting a drop rudder forward.

Should Mr. White's plan be found applicable to them, their activity in the water will be greatly increased by its adoption. The little craft was put through a severe trial last Saturday. The behavior of the pinnace has answered every expectation, while its remarkable handiness surprised the officers in charge. At a previous trial the boiler pressure, with closed stokehole, was 120 lbs. (the same as in the torpedo craft), while the air pressure from the fans equalled 4 inches of water; the revolutions per minute were 435, and the horse power indicated 90. Six runs were made, the mean speed ahead being 12.356 knots per hour. Two runs were afterwards made with the screw going astern, the result giving an average speed of 10.14 knots, the revolution being the same.

The steering qualities of the boat were next tested, when the absence of the after deadwood gave some remarkable results, the boat circling to starboard and to port in 30 seconds, or one-third the usual time, in a space having a diameter of 72 ft. With the engines going astern the pinnace turned in 1½ minute. As the propeller shaft revolves in solid water, and is only connected with quarters by means of a bracket, there was a remarkable absence of vibration. The two rudders are simultaneously actuated by means of gearing and a double worm, which effectually locks the rudder, and thus enables the wheel to be left to itself. —*London Times*.

SIR H. BESSEMER ON HIS IMPROVEMENTS.—Sir Henry Bessemer was presented with the freedom of the Cutlers' Company on Wednesday, Mar. 16th, and was subsequently entertained at a banquet, in recognition of his services to the cause of technical education, which the company is endeavoring to promote. The Master, in proposing "the health of Sir Henry Bessemer," said that gentleman had done that for the prosperity of his country which would continue to be fruitful of good in future generations. In proof of the manner in which the influence of his work in this country spread beyond our shores he mentioned that he had recently received an application from Ohio for copies of the lecture which had been delivered in that hall. Sir Henry Bessemer, in acknowledging the toast, said with regard to the educational movements which had been so long commenced by the Cutlers' Co., if he could further their efforts in that direction he would be pleased to do so. That the Master should have received a note from across the Atlantic in reference to his lecture he was not surprised, because no country was more ready than America to take advantage of the improvements of the age. His invention had been most cordially taken up in that country, for which he had received a token of American regard. There had, however, been a specialty in the mode of recognizing his services there which was well worthy of the people. They had no crosses, orders, honors, or titles to bestow, but they had done him the great honor of naming a rising city in Illinois after his name.

RAIN AND CULTIVATION.—Prof. Aughey claims that more rain falls now in Nebraska than formerly, and that this rainfall is increasing with the march of settlement and consequent cultivation.

## Only a Trespass.

Through a misunderstanding of the facts of the case and the points involved, some of our people were a little down in the mouth when they heard of a decision having been given for the defendant in the United States District Court, San Francisco, in the late suit of the Jupiter mining company against the Bodie Con. mining company. They were under the impression that through the decision the Jupiter folks lost their mine. This is not at all the case. It appears in drifting the Bodie Con. folks ran across the line and into the Jupiter ground. While drifting in the Jupiter ground, they cut a vein of quartz (probably a feeder of the Jupiter vein), about 18 inches in width.

The Jupiter company then sued the Bodie Con. company for trespass. The latter company admitted that they were over on the Jupiter ground, but claimed that the seam of quartz into which they cut dipped in such a way that if followed up, the top of it would be found to be on their own ground, and held that they therefore had a right to follow it wherever it went. It would seem that this view of the matter was very strongly pressed and impressed upon the minds of the jury, therefore they brought in a verdict that no trespass had been committed.

Competent miners are quite confident that if the quartz stringer were to be followed upward, it would never be traced out of the Jupiter ground, let alone to or near to the surface. Some think it would be found to wholly run out before being followed upward 30 ft.; thus it would never get anywhere near the Bodie Con. ground, as where cut the feeder is 70 ft. from the line of that company.

The case is the same as if some company here on the Comstock had drifted west into the California and Con. Virginia ground until they had reached the feeders of ore on the 1,550 level which those companies are now working out to the eastward of their old stopes. Then when the companies named brought suit for trespass the interlopers would claim that the dip of the feeder would carry it to the surface in their own ground to the eastward—provided it should live to go so far.

Though a jury might be so far impressed with this view of the case as to give a verdict in favor of the interlopers, yet their decision would by no means give the raiders any claim to the main vein as worked in the California and Con. Virginia.

The Jupiter has one of the oldest and most perfect titles in all Bodie district, and no one should be so foolish as to sacrifice his stock just because that company failed to make its trespass suit stick. The worst thing about the whole business is that the verdict throws the cost upon the Jupiter folks, and that will amount to a mere trifle distributed among the many stockholders.

Mining men get a new wrinkle from this decision. Here is found a stringer of quartz before unknown to every one; it is found in the ground of another company, yet the finders take the angle of it and assert that it is their property because the dip shows that it crops out in their ground. In the Bodie-Jupiter case unprejudiced persons, who took the dip of the feeder, asserted that, even allowing the Bodie folks to follow it, it would go to the surface within the Jupiter lines. Even though the Bodie folks shall be allowed to keep the feeder they are on, and follow it upward, it will in no way interfere with the main lode of the Jupiter. —*Virginia Enterprise*.

THE WALKER RIVER MINES.—Persons interested in the copper and other mines of the Walker River country, are much encouraged in view of the good results obtained at the Ludwig furnace. It is turning out about three and a half tons per day of copper ingots. The ingots assay 96% pure copper, the remainder being iron, while assays of the slag show but one-eighth of 1% of copper. This is remarkably clean work. The supply of copper ore is almost inexhaustible, and is very easily mined. No doubt other furnaces will soon be erected in that region and several flourishing mining camps built up. There are in that region not only many veins of copper ore, but also those containing gold and argentiferous galena. This smelting region will no doubt make a large amount of business for the Carson and Colorado, and should be fostered by putting down the freights on the coke taken in and the copper brought out to the lowest possible notch. Beyond this to the eastward there are doubtless other places where furnaces may be profitably run on ores of various kinds. —*Virginia Enterprise*.

A VALUABLE DISCOVERY.—A ledge of gold-bearing quartz of great size has been found in the San Francisco canyon, near the old stage road between here and Los Angeles. It is easy of access, plenty of wood and water convenient, and is said to be one of the most promising discoveries of the kind ever made in the State. Placer mining, on a limited scale, has been carried on in this canyon from time immemorial. Prospectors have always believed that rich and extensive leads of gold-bearing quartz would be found there, but this is the first great find ever discovered to warrant their faith. It is a matter of history that the first gold ever discovered in California was found in this canyon in 1841. If surface indications are worth anything, the debris that covers the bedrock there—the wash and accumulation of ages—covers the best gold lead on this coast. —*Kern Co. Californian*.

## Industrial Partnership.

In the hall of the Society of Arts, on Wednesday the 16th inst., a paper was read by Mr. Sedley Taylor, M. A., late Fellow of Trinity College, Cambridge, "On the Participation of Labor in the Profits of Enterprise." Mr. W. H. Hall was in the chair. Mr. Taylor remarked that his justification in bringing the subject forward was to be found in the consideration that the relations between employers and employed under the system of payment by paid wages only were admitted on all hands to be unsatisfactory. This involved a chronic antagonism, breaking out periodically into internecine conflicts, which caused mutual exasperation. The bulk of these experiments had been made on the continent, and though not without examples of failure, they presented on the whole a very decided and encouraging success.

He then described, in a manner necessarily fragmentary, the main features of participation as practiced on the Continent. As to the system itself and its applicability to English circumstances, the theory on which it was based was that by directly interesting workmen in the fruits of enterprise better and more economical labor would be obtained, and thus a source of additional profits opened. These surplus profits, without injustice, might be allotted wholly to the workmen whose stimulated efforts produced them. In practice, however, a share went to the employer, who, if he pleased, might invest it in a reserve fund and protect himself against losses in bad years. Thus participating workmen did, in an indirect, but perfectly real way, share losses as well as profits with their employers. Participation successfully practiced, under whatever form, conferred signal benefits on the parties directly concerned in it. To the employer it gave industrial peace and increased security; for the thrifty workmen it accumulated as the result of his own efforts an economical capital which he might employ in making his old days easy and independent, or enable him to transmit a provision to his children. It brought to the workman likewise an enhanced feeling of respect for himself and his fellows.

Participation encouraged excellence of workmanship, and combated every form of trade dishonesty with singularly efficacious vigor. Considerations could be adduced to show that there was no lack of scope for participators' successes in many branches of English industry. He was inclined to think that participation in profits, if once clearly set before the working classes of this country, would soon be thoroughly understood and appreciated by them. His own conviction was that participation had a great future before it in this country. The work might well be undertaken by a special society, which should endeavor to facilitate in England the practical study of participation, whose objects should be identical with those of the French society, and which might spread sound knowledge on the subject; and he would be very pleased to receive at Trinity College, Cambridge, the names and addresses of any persons who would be disposed to join such a society, should it be called into existence. A discussion followed in which Mr. Lloyd Jones and other gentlemen took part, and which was adjourned to a day to be hereafter announced. —*Engineering and Building Times*.

## Does Mining Pay.

The question of the hour, does mining pay? can be answered very readily—quite as readily as if the interrogatory was made applicable to any other industry. The manufacturer, the merchant, or the farmer, in engaging in either pursuit, has at first in hand a problem to solve. He enters into the undertaking with hopes of success, and sets about the business with such experience as he may be possessed of; and as a rule, which all have experience must know, with capital necessary to prosecute the particular line of business selected. Prospecting for mineral is not mining, as many suppose, any more than farming is an industry without suitable soil for tilling. Many labor under the impression that a mining claim valued by the prospector at \$10,000 to \$100,000 is a mine; and here is a point, reached early in the history of the ambitious, where the mistake is made. There are many well-informed people who have but a faint conception of what constitutes a mine. To look at a prospect hole, or a mineralized vein, an incline or a drift, or even a deep shaft, does not at all times prove the existence of a mine.

Mining has advantages over many other industries, when all the preliminary work is perfected; and it is with this work that the industry becomes a success or a failure. To find a paying mine, we must unlock the hidden treasures of the earth's inner surface, and overcome the jealousies of locality. Mother earth in reality is a mine, and in her hidden treasures the paying mine is found to be a storehouse of ponderous rock. Paying mines exist in every well-known mining district; and when opened, and the business conducted upon conservative principles, the profits will compare favorably with any industry known. To secure the desired mine, the mere prospect may be passed; we must enter where the natural forces have gathered and blended in successive ages that chemical combination of primitive rock; and with capital, industry and the various scientific experiments given us, test the value of nature's generous deposits. These exist in fabulous quantities from Mexico to Montana, and as settlement is made in those regions, mining becomes more general and profitable. —*Boston Economist*.

## A Ruined City.

Four miles northeast of town, near Ross' Mills, there are several large and regularly shaped mounds. The largest of these mounds is within 20 ft. of the well-traveled road to Tempe. It is about 40 ft. high, and, when once the curiosity hunter has clambered through the debris of fragments of adobe and earthen pottery which covers the sides to the summit, he is rewarded by discovering the well-defined divisions of what was once a large house. Although large trees of the slow-growing mesquite have sprung up, the adobe walls which divided the interior of the building into rooms still remain whole and intact a foot beneath the surface. In some of these walls there still remain the ends of the rafters used to support the floors. All these pieces of rafters are charred, and appear as though they had been at one time subject to intense heat.

Looking to the northwest from the top of this ruin the eye sweeps a small plain, thickly dotted with mounds which differ from the large one only in size, and the whole is enclosed with the remains of what was once a thick adobe wall, the southeast corner of which was formed by the large house. An examination of the ruins discloses a regular system of streets running north and south, intersecting one another, and forming regular and equal-sized squares. Immense quantities of broken pottery strewn the ground, and from these fragments, a relic hunter can select, with a little patience, a score of pieces, with each piece bearing a different design; but this variety in design applies only to size and shape, as no colors save black, dark blue and dark red appear to have been used by these ancient decorators.

Here and there can be found fragments of shell ornaments, bracelets, ear-rings, etc., manufactured from a shell somewhat similar to abalone. Everything connected with this desert of ruins tends to give rise to the opinion that the destruction of the city was sudden, speedy and complete; but when and in what manner, it, in common with other cities, was blotted from the land we now occupy, must forever remain a matter of conjecture. —*Phoenix Gazette*.

## French Merchant Shipping.

The new law under which French shipbuilders and ship owners are to receive substantial bounties from the State, has already had quite a contrary effect to what was expected. The jealousy of manufacturers has been aroused, and a reaction has set in which must be regarded as a signal for more clamorous demands in the same direction. A writer in the *France* ridicules the statement in the preamble to the new act that the bounties are accorded "in compensation for the charges which the Customs tariff imposes on shipbuilders," and "for the charges imposed on the merchant navy for furnishing recruits and the service of the military marine." "If," says the writer, "the Customs tariff is defective, it should be amended. Otherwise, now that bounties have been granted to shipbuilders, the same favor must be accorded to cotton spinners, forgemasters, and everybody else." Moreover, it is pointed out by the writer that, if, after all the efforts made to improve the position of the French commercial marine, they should result in failure, ship owners might console themselves by the thought that the evil, Great Britain alone excepted, is universal, and that bounties will nowhere bring about the slightest remedy. The article concludes:

"Italy, which formerly built ships representing an annual tonnage of 100,000, did not perhaps, add 20,000 tons to her home-built shipping a year ago. The United States, which at one time carried by sea 90 per cent. of their own merchandise, were only represented last year by 15 per cent. A fatal revolution has occurred. Steam has swept away sails, and iron and steel have taken the place of wood. And with what result? That vessels are now mostly built where iron, steel, machinery and coal are obtainable at the lowest rates, or, in other words, at Glasgow on the Clyde, Newcastle on the Tyne, and Sunderland on the Wear. The shipbuilding yards of London and Liverpool have themselves had to give way." The French will sooner or later regret that common-sense views such as these should have had no effect in altering the mischievous decision arrived at by the French Legislature, which, however, fortunately, is not irrevocable. —*Iron*.

A BLIND MAN INSPECTING A MINE.—A short time since two men, one of whom was totally blind, requested of Edward Coleman, Supt. of the Idaho, the privilege of going down into the mine to take a look at the underground workings. Mr. Coleman who is always accommodating to visitors in this respect courteously assented, much to the astonishment of Uncle Billy Thomas, who acts as chaperon to visitors on such occasions, who remarked, "Well, by golly, I have taken all kinds of people down into the mine,—ladies and gentlemen, the lame and the halt—but this is the first time I ever heard of a blind man wanting to go down." He said afterwards, with a grim smile, that he gave the blind man a lighted candle, as it was the regular and proper thing to do. The visitor was highly pleased with his trip on the cage, and his underground trip 1000 ft. below the surface, but Uncle Billy has not yet recovered from his surprise that a man who could not see should desire to go down into the Idaho to see how things looked in its cavernous depths. —*Graess Valley Union*.

## MECHANICAL PROGRESS.

## Metals and Paints.

The subject of painting metallic bodies is not generally understood by many painters or architects, and as in this country there is a great necessity for the proper covering of all metallic surfaces to shield them from the elements, the subject will bear investigation with profit. Metallic paints and other compound chemical mixtures, are heralded as the paint for all work, whether wood or metal. It is true of these, and many other kinds, that they are good for painting, but not for preserving metals from oxidizing.

All fine preparations of the carbonates and oxides of lead or copper are unsuitable for this purpose, for the reason that a pure oxide, when applied to other metals, will assist in the action of the elements to oxidize the metals they cover. The vehicle of all good paint is boiled or raw linseed oil, and this, when thickened with pigments, covers a less given space; and the material being an oxide, holding more oil than is imparted to the surface to be painted, soon throws off its share and is ready to absorb the air and convey it to the body of the metal, where natural corrosion will take place, and then the two oxides unite chemically. In other words, all paints, in the absence of a solvent, which time soon releases them of, act upon iron or tin as a filter, feeding the porous spots with moisture, like a porous plaster of rust; and as like produces its kind, the decomposed metals work like a happy family, and roll in beds of rust. This fact is observable on flat surfaces, or in gutters where inequalities occur. Here the fine dust or powder collects and keeps the water in them until the oil is decomposed; then the work of oxidation commences.

There is another fruitful source from which rust on the upper or under side of roofing tin comes, and that is, mixing paints in common, cheap oils of kerosene, containing sulphuric acid. This oil never dries. It may harden the film of paint so as to allow the acid it contains to corrode the tin, and the best paint in the world on the opposite side cannot prevent the acid-eaten holes from coming through; and judge the effect, where both sides happen to receive the same potent mixture.

The best paint for tin or iron is composed of pure linseed oil and earthy ochres, red or yellow. The coarser granulated powders are best as a pigment, as they offer less air holes and give a firmer hold for the oil on the grits, and thus bend them to the metal. The oil in this manner gets close to the metal, and offers resistance to the air in removing the atoms from its cohesion. Beware of all metallic oxides, or mineral paints, especially on lofty towers or inaccessible coverings of metal.

Roofing tin should, when laid, be kept clean from windfalls of dust, and painted once in every two or three years, by the day—never by contract. Metals applied in the angles of roofs as flashings, where shingles are laid behind parapet walls, should be well painted, on both sides, and the exposed crevices between the laps putted and painted, and thus cut off leaks in corners "which no feller can find out."

I have known of a case where leaks in an outer wall from an A No. 1 tin roof were undiscovered for years. Carpenters were called, imperfect boards were removed from the exterior wall side, and the whole repainted. Still, there was the leak unabated for years; and at last, the painter being called upon to find out the source of the trouble, found upon examination that the clap-boards on the inner side extended down to the tin, or nearly so, thus preventing the paint from reaching the angle of the tin back of the boards. There the dust collected, and dampness had eaten through, and a ruinous leak was discovered by simply sliding a putty knife under the edge of the siding. Wood work never should be allowed to close down on the metal, but instead, a space of one or two inches should always be left, so that paint can be easily applied to all flashings on all sides, and where the dust can be easily swept out. Many troublesome leaks occur from the base of balustrades shutting down so close that dirt is completely imprisoned, and consequently in time decomposition sets in, and the metal coverings are ruined. Bay windows, with balconies, or with other ornaments, if put on with an idea of permanency, should leave ample room for the painter's brushes to reach every angle, nook, or corner, and thus save a thousand leaks.—*Cor. of California Architect.*

**IMPROVED LACE MACHINES.**—A machine for making laces hitherto produced only by hand work is reported in France. Even old styles of laces, the art of making which has been lost, can readily be reproduced. The machine employs from 1,800 to 2,000 spindles, and from 200 to 300 pins. The *Moniteur des Fil et Tissus* speaks in high terms of the machine and its products, which are said to be fully equal to the best hand-made laces.

**CEMENTING LABELS TO METALS.**—For attaching labels to tin and other bright metallic surfaces, first rub the surface with a mixture of muriatic acid and alcohol; then apply the label with a very thin coating of the paste, and it will adhere most as well as on glass.—*Amateurs' Handbook.*

## To Keep Gun Barrels from Rusting.

The Boston *Journal of Commerce* says: One of the great difficulties which the sportsman has to contend against is the rusting of his barrels, even when protected by the best browning. The alkaline matter existing in snow and in rain, under certain conditions of the atmosphere, works through the best coatings, and reaches the iron. Varnish, as ordinarily laid on, is objectionable, as it gives a gun a "brummagem" look. The best plan is the following: Heat the barrels to the temperature of boiling water (not any hotter, or you may injure them), and rub them with the best copal varnish, giving them a plentiful coating. Let them remain hot for half an hour, and then wipe them clean with a soft rag. In this way you can get enough of the varnish into the pores of the metal to act as a preservative, and, at the same time, no one would suspect that the barrels had ever been touched with varnish. We have applied boiled oil, beeswax, paraffine, and some other substances, in the same way, and obtained good results; but on the whole, we find nothing better than good copal varnish.

## Rust and Corrosion.

The same journal, in speaking of the rust and corrosion of iron in general, says: Iron is easily corroded by even the weak acids. Sulphuric acid, nitric acid and hydrochloric acid all act on it quickly and powerfully. Air and moisture also quickly corrode it. It is a curious fact that carbonate of soda protects iron very perfectly from rust. We have seen a piece of iron that had been kept in a solution of soda for 20 years, and yet was quite bright.

There are several methods of protecting iron from rust. Painting, varnishing, tinning, zincing, etc., have all been tried with good effect. Painting and varnishing need no remarks. Where bright work is to be temporarily protected, however, a paint of white lead and tallow may be used. This will not dry, and may be easily and quickly removed with a little turpentine.

## Destructive War Implements.

Dr. J. H. McLean, of St. Louis, who has expended about \$200,000 for models of implements of war which he claims are so destructive that their practical use in one campaign would force the world into a state of perpetual peace, gave a public exhibition of his inventions at Washington Navy Yard on the 27th ult. About 200 persons were present, including the Chinese Minister and suite, General Benet, Chief of Ordnance; Commander McCormick, of the Bureau of Navy Ordnance; Admiral Scott, Colonel Macaulay, Captain Harrison, Lieutenant Very and many army and navy officers. There were 14 implements on exhibition, but only four of them were tried, and of these only one worked perfectly. The "General Sherman," a small breech-loading cannon, which was expected to fire 26 shots per minute, fired 20 shots in a minute and a half. The "Vixen," built of bronze, fired a one-inch ball once in seven seconds. The "Annihilator," which was intended to fire two charges in a second, fired one in a little less than two seconds. The "Lady McLean," which has 36 barrels with an estimated capacity of nearly 13,000 shots per minute, with a range of three miles, was worked to the speed of 72 shots per second. The other guns were not in order for trial. Among other inventions that Dr. McLean exhibited is a magnetic torpedo propelled by clock-work, and guided to iron ships to be destroyed by a loadstone. The guns were pronounced fairly successful by the officers, but the claim that they would bring on a millennium was by no means admitted.

**A COMPOUND AIR-ENGINE.**—The principle of the compound steam-engine has recently been applied to the working of a compressed-air engine in England, by Col. F. E. B. Beaumont, of the Royal Engineers, and we learn from various accounts that it has proved highly efficient and satisfactory. The engine possesses some peculiar features which render it very economical in the use of compressed air. It has two cylinders, one being much larger than the other. Into the smaller of these the compressed air is taken directly from the reservoir, and after doing its work there it is discharged into the large cylinder, where it is further expanded, being finally discharged into the open air. The admission of air to the smaller cylinder is regulated by an adjustable cut-off apparatus, which admits of maintaining a uniform power under a variable pressure. When the reservoir at first starting contains air at a very high pressure, the cut-off is adjusted so that the small cylinder receives a very small charge of air at each stroke; when the pressure in the reservoir diminishes, the cut-off is delayed so that a large quantity is admitted to the small cylinder; and when the pressure in the reservoir is so far reduced that the pressure on the smaller piston gives it very little power, the supply passages are kept open so that the air acts directly on the piston of the larger cylinder. This arrangement is also available when the air pressure is high and great power is required for a short time, as, for instance, in starting a locomotive. It is, perhaps, needless to mention the advantages a motor of this kind possesses over the steam locomotive. The absence of smoke and noise makes it particularly desirable for tunnels, elevated roads, and, in fact, for any city railroad.

## SCIENTIFIC PROGRESS.

## Detecting Gas Leaks.

Mr. G. F. Ansell, of England, whose death was recently announced, recently applied these principles of his fire-damp indicator in the production of a handy little instrument for detecting gas leaks. The action of Mr. Ansell's fire-damp indicator is founded on the fact that different gasses have different rates of diffusion through a porous body, the velocities of diffusion being inversely as the square roots of their respective densities of the gasses. In the gas-leak indicator this property is taken advantage of as follows: A small chamber is provided, having its back formed by a disk of terra-cotta, this chamber being provided with a small stop-cock, by which its interior can be placed in communication with the outer air. If, when this stop-cock is closed, the indicator be taken into a room where a gas leakage exists, the gas, in virtue of the above-named law of diffusion, enters the chamber through the terra-cotta disk more rapidly than the inclosed air escapes, and the pressure in the chamber consequently rises. This increase of pressure is utilized to move a hand on a dial at the front of the instrument, each pressure corresponding to a certain percentage of gas in the atmosphere in which the indicator is placed. The dial is graduated from 0 to 35% of gas, and is moreover marked to show when the mixture is and is not explosive. The instrument is very sensitive and prompt in its action, and it is calculated to serve a very useful purpose.

**MANGANESE METAL IN THE ARTS.**—The Germans appear to be making extraordinary efforts to extend the uses of manganese in various forms. As the displays of various works at the Dusseldorf exhibition showed, they are now manufacturing not alone high-grade ferro-manganese, but also almost pure metal and its alloys. The high price, due to the difficulty of reducing manganese from its ores, makes the use of the highest grades of manganese for steel impossible, but the Isabellen-Huette, at Dillenburg is making a material running as high as 94% of manganese for special purposes. They use it in the preparation of various alloys of manganese and copper, used in the refining of copper and the manufacture of manganese, bronzes, brass, etc. While phosphor copper and phosphor tin must be added to bronze with great care, in order to prevent an injurious action upon the tenacity and ductility of the metal, and while phosphor bronze does not stand repeated re-melting without parting with its phosphorus, manganese can be added to the extent of 10% and forms a part of the alloy. The manganese copper, generally used for improving the quality of bronzes, brass, etc., contains 30% of manganese. The Isabellen-Huette produces also an alloy of 89% of copper and 11% of manganese, which, cast in sand, shows a high tenacity and ductility, and replaces copper in some respects. No tin whatever is added, and it is believed that this manganese and copper alloy may be used for guns, etc. The pure manganese metal, a mass which crumbles easily, has been tried with much success in the Mansfield copper district for refining, and there are prospects of its adoption for this purpose as soon as the price has been somewhat reduced.

**THE ATMOSPHERE OF CELESTIAL BODIES.**—M. Jose J. Landeur communicates an interesting paper to *Les Mondes* on the atmosphere of celestial bodies. Whereas previous investigations have given about 250 miles as the furthest result for the height of the earth's atmosphere, M. Landeur places it at not less than 22,000 miles. He corroborates his calculation by showing that the light at which meteoric matter becomes incandescent on approaching the earth is far beyond the distance heretofore assigned to it, and therefore there must be an atmosphere at that greater distance to produce the incandescence. He also accounts for the spectrum of the aurora borealis, showing a marked coincidence with that of the zodiacal light by the theory that since the earth travels in the zodiacal nebula from September to May, the rarified atmosphere beyond the earth's heavy envelop of air must absorb some of the constituent elements of the zodiacal nebula, and thus these elements make their presence apparent in the spectrum of the aurora, which phenomenon occurs in this rarified outer envelop. M. Landeur believes also that the difference between the observed acceleration of the moon's mean movement and that obtained by calculation on any of the previously advanced hypotheses, which is very marked, may be wholly explained by the resistance of this nebula in the moon's movement.

**RECTIFYING ALCOHOL.**—If a quantity of 40% to 50% alcohol is placed into a retort and a vacuum is created in this retort by means of an air pump, and the retort is placed into or in connection with the cooler of an ice machine, the alcohol will be evaporated. As the evaporation of the alcohol causes the temperature of the retort to drop below the surrounding temperature, the warmth of water at an ordinary temperature will be sufficient to evaporate the alcohol, and the same can be rectified without the use of fuel.—*R. Pictet, in Revue Univ. de la Brass et Dist.*

**LIVE STEAM.**—The experiment of delivery of "live steam," from a central source, appears to have met with good success in the enterprise of the Hartford Steam Company. The Hartford Post, which has tested the steam for heating and power, says: "It is found that the heating is very thorough, and that as motive power it has decided advantages. The steam delivered to the engine is thoroughly dry, and is found more effective than that made on the premises when showing the same gauge pressure. Using the same pressure of steam it is found that the presses can be run faster than on the old supply, and with a uniformity of speed that is very desirable, and is an advance on any results previously obtained. One special advantage is the almost absolute uniformity of the pressure and in connection with the positive advantages there is to be noted the absence of dirt, dust and ashes, and the great convenience of merely opening or shutting a valve in place of attending to the firing and water supply of a furnace and boiler. After several days trial it seems sufficiently evident that the new departure is a success in both of its applications."

**BLEACHING BY THE ELECTRIC LIGHT.**—M. Leon Manet has devised a process for bleaching hood aluminen by means of the electric light. The aluminen is taken after separation, and either before or after drying. It is then exposed to the light. The inventor arranged electric lights fitted with lenses or reflectors, so as to cast their light upon the aluminen which is to be bleached. If it is still liquid the light is thrown upon the plates or trays which contain it in the drying stove. These plates may be made of glass, so as to let the rays pass through them. If the aluminen is dry the light can be thrown upon layers of the article arranged upon the stage. In either case the process varies in duration, according as the aluminen has been more or less completely separated from the clot. Under ordinary circumstances 24 hours will suffice to bring about a perfect decoloration. For more efficacy the electric light may be brought into action at the beginning of the process, when the clot and the aluminen are being separated.

**NOVEL EXPERIMENT.**—The Port Jarvis, N. Y., *Gazette* says: An odd-looking car has been running over the eastern part of the Erie road recently. The top of the car was covered with wind-mills and revolving cups, so that it looked like the roof of a signal service station. The object, it is said, was to test the pressure of the atmosphere on cars going at different speeds, so as to determine of what shape to make the front of the cars to best resist this pressure, which is very great. The sloping, curved end of the mansard-roofed cars was found to be the best, and the more curves at the end of the car the less was the atmospheric resistance, according to the experiments made.

**EFFECT OF COLD ON MAGNETIZED STEEL.**—A recent investigation conducted in the physical laboratory of Harvard University has led to the discovery of the remarkable fact that intense cold can deprive magnetized steel bars of nearly all the magnetism which may have been imparted to them. The intense cold was produced by solid carbonic acid. This fact has an important bearing upon observations of the magnetic condition of the earth taken in high latitudes; for what appear to be daily and yearly changes in the earth's magnetism may be due in large part to conditions of temperature, which affect the magnets used in the observations. It also must be concluded that the molecular condition of steel is changed by great cold.

**THE SENSE OF COLORS.**—At a recent meeting of the French Association for the Advancement of Science, M. Carpentier, of Nancy, read a paper, in which he propounded the somewhat novel theory that the sense of light and that of colors are independent. Since white light is the sum total of the various colors, it has been commonly thought that the sensation of white light was simply the sum total of the sensations of its constituent colors. On the ground that the sensitiveness of the eye for white light may be increased—as, for instance, by the previous absence of all light—without the sensitiveness for color being increased, he urges that there is a color sense as distinct from that of light as is the sense of touch from the sense of heat.

**ELECTRIC TIDES.**—Mr. Alexander Adams, of the English Postoffice Telegraph Department, reports that he has observed the existence of electric tides in telegraph circuits. By long continued observations he has determined distinct variations of strength in those earth currents which are invariably present on all telegraphic wires, following the different diurnal positions of the moon with respect to the earth. He read a paper on the subject at a recent meeting of the Society of Telegraph Engineers.

**MICROSCOPIE MACHINERY.**—Machines in a watch factory will cut screws with 589 threads to the inch—the finest used in the watch has 250. These threads are invisible to the naked eye, and it takes 144,000 of the screws to weigh a pound. A pound of them is worth six pounds of pure gold. Lay one upon a piece of white paper, and it looks like a tiny steel filing.

**A NEW SAFETY LAMP.**—Dr. Irvine, of Glasgow, has invented a new safety lamp, which is so constructed as to emit a loud sound when an explosive mixture of gas and air enters it; by this means the existence of fire-damp in collieries is readily indicated.

**ELECTRIC LIGHT IN MINES.**—We see by the *Oroville Register* that the balance of the machinery for the electric light to be used at the Spring Valley company's mine, has arrived at its destination at Cherokee. There will be four of these lights used at the mine, each of 8,000 candle power. When fully in operation the night work of the mine can be prosecuted with the same vigor and safety that it can by daylight. Mr. Walder, the Superintendent of the company, is a man of energy and infinite resources, and, withal, intensely practical in his ideas; hence, whatever operation he inaugurates to facilitate the working of the mine we shall have a great deal of confidence in.

A DISPATCH from Seattle, W. T., on March 29th says: Captain Blasdel, a San Francisco coal expert, left here this morning en route for Queen Charlotte island, for the purpose of examining extensive anthracite coal beds said to have been discovered there.

#### Mining Share Market.

</

made is regarded as a very valuable property. It was removed on Thursday that San Francisco parties had telegraphed an offer of \$10,000 for the Jackson, but the owner could not be traced to accept reliable source. It is known, however, that Messrs. Ryan & Marshall have refused an offer of \$10,000 for the property, but from what source the offer came we could not learn.

#### NAPA.

**MR. COFFMAN'S MINE.**—Napa, Register, Mar. 29: Wednesday Mr. A. C. Coffman brought into our office several pieces of gold and silver bearing reliable source. The mine is in the hill back of his house northeast of town. He has commenced a tunnel near the base of the hill, and will on the first of next month commence work in earnest, having employed an old and experienced miner to prove the claim. Mr. Coffman has had at different times, and by different parties, 3 assays made, the rock yielding in silver \$22.50, \$23.65 and \$20 to the ton. If he has any great quantity of this kind of rock, and he thinks he has, he has a good thing, as it pays well to work rock yielding but \$10 a ton.

#### NEVADA.

**A BIO CLEAN-UP.**—Transcript, Mar. 23: The clean-up from 504 tons of ore from the Chamonix mine, at Canada Hill, was made Monday at the Pioneer mill. The result was a little over \$3,000 in free gold and nearly \$1,000 worth of sulphuric acid. The average yield per ton, including sulphuric acid, was a little over \$90.

**PROMISING PROPERTY.**—After the tunnel of the Chamonix mine, which is now in 2,000 ft, has advanced about 25 ft further, stopping will begin. Recent developments have been of such a character that it is said to be the purpose of the company to put up a stamp mill this season. The tunnel is one of the finest pieces of work of the kind in the State. It extends most of the way through hard rock over 6,000 ft of time and \$35,000 in money have been consumed in running it. The splendid success of the Providence, Merrifield, Wyoming and other great mining enterprises in that immediate vicinity, are indicative that the enterprise and persistency of the Chamonix folks will, before many months, be rewarded by substantial returns.

**A FAIR CLEAN-UP.**—Lewis Wheeler & Co., who recently purchased the hydraulic claim at Scott's Flat, formerly owned by Sam Jordan, have just made their first clean-up. Considering all the circumstances, the result was pretty fair.

**THE PRICE PAID.**—We are informed that the Eureka Lake company paid Cowger Bros. the sum of \$12,000 for their hydraulic claim at Snow Point, this county.

**THE PROVIDENCE MINE.**—The new 40-stamp mill of the Providence Mining company, for which ground was broken Monday, will be put up on the site of the old Monnier reduction works, between the hoisting works and the present 20-stamp mill. The wood-work will be done by the company, while the iron work will be executed by George G. Allan, of the Nevada foundry. The mill will contain the most approved modern appliances. It is expected that the mill, which is to be run by water power, will be completed within the next 70 days. The company have recently purchased the Williams ground, which is the location of their new shaft on the hill. In order to develop this ground it will, we understand, be necessary, to erect new hoisting works before many months have elapsed.

**THE BANNER MINE.**—Work is being prosecuted vigorously at the Banner claim, and the prospecting operations have thus far proven reasonably encouraging. A drift to the north has been started at the 200 level, and is now in 15 ft. Sinking for the 300 level is going on as usual.

**SAILOR FLAT MINE.**—The Sailor Flat hydraulic mining company, at Blue Tent, will next week begin to make their first clean-up for the present season. A large amount of gold will doubtless be realized.

**BLUE TENT MINE.**—Though little is generally known regarding present operations at the Blue Tent hydraulic mine, we are assured that a golden harvest is being reaped.

**THE MURCHIE MINE.**—The foundation for the pump engine at the new shaft of the Murchie mine is being laid, and will soon be completed. The ages will be put in a few days, and by next month the operations will be under full headway. The luncheon for the new 20-stamp mill on the ground, and the prospecting inside of 10 weeks the shaft will be down. George G. Allan has the contract for erecting the mill. A fine 4-ft ledge show in the bottom of the shaft, and several tons of it already on the dump shows it to be fully as rich as any development ever made in the mine. Some of this ore will pay \$400 a ton, it is thought by good judges.

**CISCO COX.**—The Superintendent of the Cisco Con. mining company states that no damage has been done to the buildings or retaining the heavy fall of snow and rain during the winter; and that the snow is now fast disappearing, and that the indications are that the season will open from 1 month to 6 weeks earlier this spring than last. Estimates are being prepared for 30 additional stamps for their mill, which will be added as soon as work can be properly done.

#### PLACER.

**THE SKASON.**—Placer Times, Mar. 20: The present season promises to be a profitable one with the miners of this section. All the different claims, with very few exceptions, are being worked in this vicinity. The Little York, York Bet, Lowell Hill, Dutch Flat and other hydraulic mines are nearly all mined and work is being pushed with the prospect of a good, long season's run.

At Dutch Flat the Polar Star hydraulic mine works a crew of 50 men, and we understand, the same company contemplates soon to commence work in their other hydraulic claim, the Southern Cross, with a good force of men.

The Baker is being worked by a full set of hands, and a night shift. Several men are at work for the same company, washing out the tailings in the Dutch Flat canyon. A night shift is also employed in the work.

J. H. LARSON has a lot of men at work in his claim, but it is not so extensive as any of the others in this locality.

**UNDERCURRENTS.**—The undercurrents in Beal's canyon, owned by Mr. Beal, of San Jose, and under the management of Adams Barrett, of this place, are doing good service in catching and retaining the fine gold being sluiced through the canyon by the Cedar Creek company.

The Gold Run & Miners' Ditch company's claim, at Gold Run, is being worked by several men, as is, also, the New Gold Run claim, at the same place. There are other important claims in the same vicinity of which Col. Moody, W. H. Kinder's and others, are all being worked to advantage.

C. H. CARR, who has a lot of flumes and undercurrents in Squier's canyon, has several men at work overhauling and reworking the large deposit of tailings along the line of his flumes.

V. CURRAN has 2 well-arranged sets of undercurrents at the dump end of the Polar Star tunnel, which he is kept busy in attending to. He expects to realize handsomely during the season's run of Polar Star, by catching the fine gold that will pass the one undercurrent belonging to the company.

All the drift mines at Lowell Hill, Steep Hollow and Remington Hill are being worked with better and more promising results than ever before, taking the whole lot on an average.

A. LARSON has commenced work extending the tunnel in the Shady Glen mine, at Alta. He proposes cutting the tunnel much deeper this season, and will drift mine some, also.

The quartz section of Euchre bar and Humboldt canyon is being more thoroughly prospected this spring. A large number of claims have been located on the ledge, and more are being staked off by new parties who have been attracted that way by the favorable showing and report recently obtained. A large amount of work will be done, and considerable money expended in that section this season, in the way of developing the many claims that have been and are being taken. In fact, past developments go to prove that this will be one of the most important quartz mining sections in Placer county in a very short time.

We are informed that the Poole company propose making an addition to their quartz mill of 5 more stamps, making the mill, after the addition, a 10-stamp instead of a 5-stamp mill. The present mill was put up to experiment with, but now no more doubts are entertained as to the paying quality of the ore.

TAKE IT ALL IN THE MINING OUTLOOK for this section was never more promising than at the present time.

**GRAVEL.**—Placer Argus, Mar. 20: It is reported on good authority that the Golden Gate mine, at Damascus, is yielding very rich gravel. It will be remembered that 3 years ago the old channel was lost, and the owners, in prospecting for it, ran a slope near the face of the lower tunnel (if below the face is about 15 miles from the mouth of the tunnel), which resulted in the finding of a new channel containing entirely different gravel from what had been previously found in the mine. A large overshot wheel, 20 ft in diameter, was erected at the top of the slope. The wheel is furnished with water from the upper tunnel, and serves to raise the ore up the slope, where they are pulled outside by horses. The owners are entitled to a fortune for the energy which they have exhibited.

#### PLUMAS.

**SENAT.**—Greenway Bulletin, Mar. 20: The upper tunnel is now in a distance of 100 ft. The mine shows a ledge of 64 ft in the face of the drift.

**ARCADIAN.**—The contract will be let this week for running a tunnel some 500 ft in length. The rock is of good quality, and will pay well.

**INDIAN VALLEY.**—The track in the long tunnel is being laid rapidly, and work pushed forward as fast as possible, in order to hasten the day for starting the new mill. The tunnel is a little over 1,300 ft in length, and is being put in such complete order as to cause no delay or stoppage after the mill starts. The ore now developed is exceedingly rich, and sufficient in quantity to keep the mill in operation for a long time.

**GRANITE BASIN.**—Rev. A. P. White gave us a call on Friday evening, on his way from Granite Basin to Susanville, for which place he left next morning. He gives a very encouraging report of mining affairs at the Basin, and expects to see lively times there as soon as the snow goes off, so that mills can be brought in and started up. There are several of the mines already hounded, and some have recently been sold. We shall look for active operations and good reports from Granite Basin the coming summer.

#### SAN BERNARDINO.

**SILVER.**—Colton Semi-Tropic, Mar. 20: We have seen some very rich specimens of silver ore from the old Lee mine, on the Mohave, now owned by R. W. Waterman, of the Warm Springs.

Work is still going on prospecting the Silver Mountain mine. Prospects look more and more favorable, and we have good hopes of a bonanza right at our doors.

#### SAN DIEGO.

**SOLD.**—San Diego Union, Mar. 24: The Ready Relief mine, at Banner, has been sold to parties who will remove active operations upon it.

#### SAN MATEO.

**PROSPECTING.**—Journal, Mar. 24: The work of prospecting the deep well at the water-works in this city, for mineral, has fairly been commenced. On Monday, Miller, Rowley & Co. started up the engine, and the steamer of the city, under the command of the engineer, was put in the water. The hand pump was first put in the well, and, to the agreeable surprise of the parties, the well was found intact, the deposit of sediment in the bottom being much less than calculated on. Drilling in the bottom of the well is now being done and the rock saved for future assay. Rock will also be taken from the sides of the hole above at various depths and tested for the metallic silver which the original samples show it contained.

#### SIERRA.

**SAVAGE.**—Mountain Messenger, Mar. 26: The owners of the Savage mine are preparing to resume work.

**BRUSH CREEK.**—The Brush Creek mine is soon to be started up by a company yet to be named.

**SOLD.**—The latest report is that the Hunter's claim has been sold with the Bonanza and the money paid.

**NGOET.**—A piece of gold weighing 33 ounces was found in the Bald Mountain mine last week. It was about the shape of and nearly as large as one's hand.

**RICH QUARTZ.**—In what are known as Busch's hydraulic diggings, just below Loganville, a very rich quartz ledge was uncovered a short time ago.

#### TRINITY.

**NEW RIVER.**—Cor. Trinity Journal, Mar. 24: We are having splendid weather for mining now, and as this spring's run of water will likely get out earlier than usual, everybody hereabouts is rushing the gravel through wonderful activity, and the prospects at this time are fair for a good showing when the final clean-up for the season is made. Messrs. White & Buckley, of the Slide Creek company, have also 2 men on the Eagle Creek claim. This claim is well rigged with iron pipe and a giant. On the Slide Creek claim no work has been done this winter in the shape of mining, with the exception of a week's run in the water, which was a success. The water, they showed an average of \$20 a day. Undoubtedly the best claim on the river now is that of Corson & Donald, but they have a very small bead of water, enough, however, to prospect the claim well. This they have done to their satisfaction. Whenever they had a sufficient head of water for sluicing during the heavy rains, they made on an average \$10 a day to the man. Last week they surveyed the ditch from a gulch 15 miles above their claim, and this will give them, when dug, all the water needed for 7 or 8 months in the year. At present they are building a flume across the river, which will be some 80 ft high, with a span of 70 to 80 ft. For the present they are only going to take the water on Cape Horn bar, and mine thereon until summer; then when water gives out they will dig the ditch to their claim. Both parties are young, stout men and intend to make a state at mining, and they are certainly going about it in the right way.

#### TUOLUMNE.

**ALABAMA MINE.**—Tuolumne Independent, Mar. 24: The Alabama mine, on the new ledge, has improved 20% the last 3 weeks. The manager, Mr. John Dart, is expected to fully 20% of the ledge, running north; so keeps the full capacity of the 40-stamp mill constantly employed. Gold is in sight in the west face.

**GEM.**—The Gem mine, Mr. Harris', is keeping its 10-stamp mill crushing regularly. The mine never looked better than at present.

The New Albany mine, on the North Fork of the Tuolumne, is carrying on its work by contract. A new vein mine, in showing very promising looking rock.

We hear that the north extension of the Chapparral mine has been discovered, and pay rock found. The Markham mill, on Big creek, has been purchased of the foundry and will be put in place at an early day.

**STRICK.**—A rich quartz strike was made by A. Gdon and J. Nash, west of the Lost Log, Friday. They say about 100 tons of rock was discovered, it sprinkled with gold. Tons of the same quality were found near, and on Saturday they found the ledge, not far distant, some 3 ft thick. The rock is a queer conglomerate, and would be passed by every miner in the country as worthless. It is full of antimony, and on dipping a hand in the water in which the crushed rock is washed, the water is so greasy that it coats the hand. As the assay was made, it was found to be composed of dry of moisture. The rock will have to be crushed, the expense of roasting is not considered a serious matter. The rock resembles limestone, and shows that gold is where you find it.

#### YUBA.

**THE SOLO-MINES.**—Marysville Appeal, Mar. 25: Mr. Frank, the manager of the Solo mines at Brown's valley, 12 miles from this city, was here yesterday. A 10-stamp mill was built at Brown's valley a year ago, and through the summer and fall the company was busily engaged working the claim. An incline led to several levels, and for a while profitable rock was found and the ledge fol-

lowed, but the incline led away from the pay chimney and a shaft will have to be sunk. The water in the mine gave some trouble, too, on account of the scarcity of wood and the mine was stopped, to be commenced again in the summer. Then an attempt was made to work the adjacent Reliable claim, high up the hill, but this was a failure. They are now working the Flag claim, three-quarters of a mile above Brown's valley, having moved the hoisting works to that place and sunk an incline to the depth of 120 ft. The mill has not been moved, but rock much richer than that of the Solo has been found, and crushing will be commenced next week. The rock found is expected to yield \$100 to the ton, besides 15% or 20% sulphuric acid. Mr. Frank confidently expressed the belief that in a month the developments will create excitement at Brown's valley.

#### NEVADA.

##### WASHOE DISTRICT.

**UNION CON.**—Virginia City Enterprise, Mar. 27: On the 2500 level the joint Mexican cast crosscut has been extended 35 ft, and the joint Sierra Nevada winze has been sunk and timbered 10 ft.

**ALTA.**—During the past week we sunk and timbered the shaft 30 ft, total depth 1,885 ft.

**C. & C. SHAFT.**—Cutting out a hoh station at the 2100 level, and cutting out a working station at the 2500 level.

**TOTAL DEPTH.**—The shaft below the 2500 level, 24 ft.

**UNION SHAFT.**—The shaft has been sunk and timbered 8 ft during the past week. The relief pump at the 2000 level is connected.

**MEXICAN.**—On the 2700 level joint Union Con. drill hole No. 2 has been extended 200 ft.

**HALE & NORCROSS.**—The north drift on the 2100 level is in 35 ft; ground tough and blasts poorly. The 2100 winze is showing some spots of ore.

**ORION.**—On the 2700 level joint Mexican drill hole No. 2 has been extended 200 ft.

**UTAH.**—The new gallow-frame at the top of the incline, mentioned in last week's report, was completed on Tuesday last, when the regular work in the mine was resumed. The incline has been sunk 10 ft; total depth below the 2150 level, 120 ft, on the slope.

**SILVER MOUNTAIN.**—The 2300 upraise was advanced 35 ft; total, 700 ft, making the connection. Ore raised during the week 201 tons.

**CALIFORNIA.**—During the past week 423 tons of ore, assaying \$21.30, have been extracted and sent to the mills.

**CON. VIRGINIA.**—During the past week 308 tons of ore, assaying \$33.43 per ton, have been extracted and sent to the mills.

##### CHERRY CREEK DISTRICT.

**STRIKES.**—White Pine News, Mar. 20: During the past week important strikes have been made in the principal mines in this district. The new developments are encouraging signs, and it is safe to predict that in another year the hulkion product of the district will be more than doubled.

**TEACUP.**—At the Teacup a promising strike has been made on the 300 level. This new discovery is opportune, and must greatly encourage the company just at this particular time.

**STAR.**—At the Star a surplus of ore has accumulated, requiring some of the miners to lay idle until better facilities are made for hauling and crushing.

**BOHEMIAN GIRL.**—Messrs. Barwick & Griswold have expended a great deal of labor on their property, and are now being rewarded by the development of a strata of ore of the richest grade, assaying from \$30 to \$400 per ton.

**EXCHANGIA.**—Still richer rock has been struck in the Exchange mine.

**DROPPING STAMPS.**—Thursday afternoon, about 5 o'clock, the new Teacup mill dropped stamps for the first time. Quite a number of visitors were present on the occasion. The mill has been in course of erection for about 3 months. All the machinery has been placed in position under the supervision of Mr. Courtney, who came out from New York for that purpose. Besides the mill several other necessary and useful buildings have been erected, notably among which is the assay and retorting offices.

##### ESMERALDA DISTRICT.

**ENCOURAGING.**—Esmeralda Herald, Mar. 26: The interest taken in the mines here during the past few months is surely very encouraging. Men of capital have been awakened to the fact before them for the past 3 years by the Herald, that a good mill is all that is lacking to make the output of hulkion prove to capitalists abroad the richness of our district, and realizing the sound sense embodied in that old saying, "the Lord helps those that help themselves," or words to that effect, are making a move in the direction of securing that much needed necessity to the welfare of the district, and it seems an almost settled fact that a good mill will be in course of erection here this summer. The mines that are being worked certainly look promising, and some of them show ledges of extremely rich ore.

**CENTENNIAL.**—The Centennial, on Silver hill, is a wonderful mine, and shows a large body of fabulously rich ore. The mine has been worked in an economical manner by the owners for the past few years, and has been made self-sustaining with the crushing of a few tons now and then of the first-grade ore. The intention of the owners is to put the mine in a condition to extract a large number of tons daily, so that when a mill is erected here this mine alone, if necessary, will be able to keep 10 stamps running steadily for an indefinite period on at least \$700 ore.

**THE ROTHEILD.**—"Yank" Gupta has gone to work on the Rotheild with the intention of opening it up in good shape.

**REAL DEL MONTE.**—The water is still rebellious, and a desperate war is being waged against it. Of course nothing can be done in the way of prospecting on the 800 level until the water is under control.

**PROSPECTING.**—The lower levels show a vast amount of low-grade ore that with a modern-improved mill would pay to work.

**HUMSOLTE WEST.**—The crosscut from the bottom of the shaft shows a better character of ore and of higher grade than that encountered in the shaft.

Quite a number of parties have been prospecting in the hills around town the last week, and now that the snow has almost entirely disappeared, others will soon start out.

#### ARIZONA.

**ARIVACA GRES.**—Arizona Citizen, Mar. 27: Mr. L. T. Farr, who came in from Arivaca on Tuesday, brought some beautiful specimens of ore from the Arkansas mine. The shaft has been sunk 125 ft, where the ledge is about 10 ft wide. The pay streak about 18 inches wide, had just been encountered, showing very fine black sulphurates, chlorides and an abundance of horn silver. The Albatross, owned by Messrs. Long & Wores, now shows a 9-ft ledge of solid ore, assaying an average of over \$100 per ton.

**SILVER BELL.**—Mr. Sol. Schwab, who got in from the Silver Bell district last Sunday, is enthusiastic over the prospects of that camp. The Old Boot mine, owned by the Huachuca M. Co., has a 100-ft tunnel into the ledge, showing a 35-ton lot of ore yielding from 45% to 50% copper. Over 1,500 tons of ore are now on the dump awaiting the erection of a smelter, which will be in place within 30 days. The scenery is described as delightful and the climate unsurpassed. Prospectors are flocking in rapidly, and the stage line has all the work it can attend to. The prospects of the camp are indeed flattering, and the boom has evidently reached there.

**RENO MOUNTAIN.**—Arizona Mining Journal, Mar. 23: At the Brown Bros' mine, in Reno mountain, they were making some important developments. Three open cuts had been made, and there were 700 or 800 tons of ore on the dump, which would average \$30 per ton. They propose to establish, in a short time, a 40-ton mill at Cave creek. He saw Mr. Shipman, who had charge of the improvements on the Vulture mine. He had just returned from Tonto basin and reported very favorable gold prospects in that region.

#### IDAHO.

**BANNER.**—Yankee Fork Herald, Mar. 22: Everything has a healthy appearance in this camp. The Crown Point never before looked as well as now. In the west drift there is 6 ft of first-class ore, the vein itself being 14 ft between walls. In the east drift there is a fine 3-ft ledge of good rock. The two chutes of ore that were 40 ft apart on the level above, are but 10 on the present level.

#### MONTANA.

**ALTA MONTANA.**—Helena Independent, Mar. 24: The Alta and Gregory mines are both well opened and properly worked. The immense quantity of ore in sight in the Alta puts the question of product for the company's reduction works beyond any question. With proper handling of its ores, the success of the company is no longer a matter of any uncertainty. On Monday next the smelter will start and the reverberatories before that time. The new mixture of the concentrates with the rich Alta ore will make the smelting charges run high.

**IRON.** ore has been discovered. Of its character little is yet known, except that its croppings carry 64% of iron and it is apparently 40 ft wide.

**THE PARSELL MINE.**—Of Poor Man's gulch, in Deer Lodge county, is developed now by a shaft 60 ft deep and a level run for a distance of 32 ft into the hill toward the west. At the foot of the vein narrowed to 2 ft, but at 50 ft it is 3 ft wide and apparently opening out considerably.

**THE EMPIRE.** of Marysville, has reached a depth of 32 ft in its shaft, and a crosscut from a good hanging wall has revealed 75 ft of "rattling good quartz," and no footwall yet is found.

**THE NEBLE GRANT.**—The contract to sink 60 ft on this level is now completed, and 24 ft of solid gale is found along the footwall. A crosscut is now 9 ft across the ledge from the footwall and no hanging wall is found yet.

#### NEW MEXICO.

**COPPER SMELTER.**—News and Press, Mar. 20: The copper smelter at the San Pedro district has just started, and the daily production is from 3 to 4 tons of copper mat.

**COL. BEROMANN.** Superintendent of the Cimarron mining company was down on Monday. He reports good progress in the erection of machinery, and that the company now has about 700 tons of ore on the dump.

**COL. GILLETTE.** passed down the railroad last week en route to the Black Range, where he is supposed to have a bonanza in the Wall Street No. 1.

**MR. S. L. WILEY.** went East last Monday on business connected with his pipe contracts in New Mexico. Mr. Wiley is putting in the pipe for the Canyon del Agua and San Pedro company, for the Aztec Placer company, and for the Moreno Valley placers.

It is expected that the pipe line for the Moreno Valley placers will be in by June, so as to secure this season's work. As soon as the snow will permit, Capt. Roger, Mr. Wiley's assistant, will visit the ditch at the head of the line to complete the estimates which he was preventing from finishing last fall.

**THE CLIFTON PLACERS.** on the San Francisco river, have lately passed into the hands of Eastern capitalists. These are said to be very extensive, and rich gravel deposits in places 300 or 400 ft thick, with abundant water, 3,000 inches, for hydraulic mining.

**MR. S. L. WILEY.** the successful and enterprising engineer, is putting in pipe, and expects to have 3 giant nozzles in operation this summer.

#### OREGON.

**PLACER.**—Oregon Sentinel, Mar. 19: Messrs. W. D. Anderson and Frank Cook have discovered rich diggings on Jackson creek, near Farmer's flat, in which they have taken out as high as \$15 per day with a rocker. T. L. Beck, of Willow Springs, has commenced cleaning up, but expects to have work until the 1st of June before completing it. Prospects look so good that he expects to pay friends in the East a visit next summer. Supt. Benner, of the Centennial, has been picking up considerable coarse gold, which indicates a good clean-up soon. Supt. Ennis reports full heads of water in the large hydraulic claims on Galice creek, and everything working admirably. The Sugar Pine ledge, owned by Green Bros., of Galice creek, is yielding rock enough to keep the arrastras running steadily. The quartz will average \$50 per ton, with plenty in sight. A. P. Ankeny & Co. this week returned with exceedingly rich ore, being picked up by capitalists for their Sterling ditch and mine, and the property is not for sale. It is estimated that it will take 30 years to work out the ground, patented to the owners. During the coming summer 2 more miles of ditch will be built.

**GOLD.**—Democratic Times, Mar. 19: D. W. Anderson and Cook Bros. have struck a rich streak in a gulch on Farmer's flat, near Jackson creek. From 5 buckets of dirt \$18.57 was realized, while one day's work with a rocker returned \$15 and another a like amount. The gold is of an excellent quality, but unfortunately the water is so light that no extensive mining can be done. The miners of Josephine county have plenty water still and are busily at work, sanguine of a good run. Water is becoming light in some places and more rain is needed there. Most of the miners will be able to run some time longer in any case. However, work at the Fort Lane diggings is progressing. Thos. Kabler, one of the proprietors, informs us that a piece worth \$10 and several smaller ones have been picked up there recently. Prospectors will find a full line of mining blanks, printed after the latest and best forms, on hand at the Times office. Also a supply of Copp's Hand-book of Mining Law, standard authority. W. H. Benner, of the Centennial mine, near Willow Springs, showed us some neat pieces of gold picked up there recently. He informs us that pipping is progressing advantageously and that a good clean-up is expected.

#### UTAH.

**BARBER MINE.**—Silver Reef Miner, Mar. 26: The Barber mine was closed down on the 21st inst., and we understand that work will not be resumed until the wages question is settled. The mill is still running, and will work up the ore on the dump before being shut down.

**SUPR. ALLEN.** has returned from his brief exile, and again assumed the management of the St. Louis company has suspended all work at the mine, in accordance with instructions received from the office in San Francisco.

No definite understanding has yet been arrived at in the matter of a compromise between the Miners' Union and the companies, although some steps looking toward that end are now in progress.

#### New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

**CENTRAL GAS CO.**—Mar. 24th. Object: Manufacturing and supplying heating and illuminating gas. Capital, \$1,000,000. Directors—Charles J. McLaughlin, Alexander Forbes, Charles Kohler, A. D. Sharon and Jacob Schweitzer.

**CALIFORNIA & NEVADA R. R. CO.**—Mar. 24th. Capital, \$2,500,000. Directors—John T. Davis, A. J. Rhodes, J. M. Reigart, S. M. Miller, B. B. Miner, James McKenley and C. H. Livingston. The proposed route of the new line is from a point near San Francisco through the foothills of the Sierra Nevada to the town of Modesto; thence easterly through Stanislaus county to a point at or near Sonoma and Columbia, in Tuolumne county; thence to a point at or near the Calaveras big trees, in Calaveras county; thence through Alpine county to a point at or near Bridgeport, in Mono county; thence to the State line at a point at or near Dexter Mills.

**CHOUINARD M. CO.**—Mar. 23rd. Location: Lewis district, Nevada. Capital, \$10,000,000. Directors—H. H. Pearson, W. E. Norwood, Thomas Holt, A. Bateman and A. C. Wightman.

## The Ferns of the Pacific Coast.

[Read before the Academy of Sciences by Mrs. S. A. P. LEMMON.]

The ferns of the Pacific coast, found growing nowhere else in the whole world, except as exported or cultivated, represent 20 species and four well-marked varieties. The number found on the Pacific coast, as well as elsewhere—i. e., the cosmopolites—are 42 species and 14 distinctly-marked varieties; adding these to the exclusively Pacific coast ferns, we have in all 62 species and 17 varieties.

In all North America, north of the Mexican boundary, there have been discovered, up to date, 151 species and 24 varieties. From this, it will be observed, the Pacific coast claims more than one-third of the entire number. With such a large proportion of this interesting and most beautiful division of the vegetable kingdom represented, it seems fitting, as we have attempted, to segregate from all directions, and put the material into compact and available form. This has been done with painstaking and no little research, compiling from the latest authorities; the newly-discovered ferns being described from personal observation, aided by the microscope, upon the living plants and the dried specimens of the herbarium.

Let us touch briefly, as the hour permits, upon the geographical range of ferns; their origin, life history, some peculiarities, their brief American literature, and, lastly, in a general way, tell something about the latest discovered ferns, together with the new ferns in general.

### Geographical Range.

Ferns generally love heat, shade, moisture and stillness; hence, are most abundant in the islands of the tropics, but they are distributed over all quarters of the globe, always in much smaller ratio than the flowering plants.

The whole number of species known and described up to date is about 3,000. Four hundred and sixty species are found in the single island of Java; the small island of Ceylon has 214 species; the West Indies, in round numbers, has 400. On the mainland, Brazil has 387; the Isthmus of Panama nearly 120; while tropical America reaches the large number of nearly 1,000. Contrast with these regions North America, north of Mexico, with its 151 species; all Europe, 67; and the Arctic zone, only 26 species.

The ratio of ferns to flowering plants may be readily seen by citing two or three examples:

Tropical America has 1 fern to 35 flowering plants.  
New Guinea has 1 fern to 4 flowering plants.  
United States (east of Mississippi) has 1 fern to 46 flowering plants.

### Floral Divisions.

North America presents four natural floral divisions—the Atlantic slope, the Valley of the Mississippi, the Rocky mountain region and the Pacific slope. When we speak of the Pacific coast, in this paper, let it be understood that we mean a naturally distinct division, bounded on the south by Mexico, on the east by a line through the mid-valley regions, lying between the Rocky mountains and the Sierra Nevada range, extending northwestward to Alaska. This general division will be found to include the southwest corner of New Mexico, all of Arizona, the southwest portion of Utah, all of Nevada, California, Oregon, Washington Territory, British Columbia and southern Alaska. This gives a wide range of temperature; from the hot tropical and forcing, through the milder temperate, to the dwarfing cold of the Arctic regions. All these conditions are, also, produced, of course, by difference of altitude, from the humid coast to the ever-snow-clad peaks of the region.

Special climatic conditions are the result of peculiar trends of coast and mountains, producing special flora. For example, the large number of plants, including the great sequoias and Santa Lucia, or Bracted fir, found only in limited localities of this region.

Ferns are always associated with ideas of shade, coolness, shelter and protection, mostly nestling around rocks or clinging to trees, filling up the shady interstices. There is, however, one exception to this law, which is very notable. A so-called variety of *Pellaea Wrightiana* is found on Mount San Bernardino, growing out in open sunny slopes, like a *Delphinium*, or larkspur, the *Salvia*, etc., and for this reason, combined with other, based upon contracted fronds, achen hue, extreme rigidity, etc., we believe it to be distinct.

### Peculiarities of Distribution.

Sometimes identical species appear in the most widely-separated regions. An illustration may be given of one of our own ferns, *Aspidium mohrioides*, known as the "Falkland Islands Shield fern," first discovered on the Falkland islands, in 1824, by the botanist of Duperrey's voyage, later at Patagonia and in the mountains of Chile; all the while limited to the southern part of South America and its adjacent islands. Now, away up in northern California, near Mount Shasta, 6,000 miles from its nearest known habitat, Mr. Lemmon discovered, in 1879, this beautiful fern, which was at first supposed by Prof. Eaton to be a distinct species. It excited such attention that a council of dis-

tinguished pteridologists assembled, and, after due examination, felt obliged to consider it identical with this Falkland island fern; but, as it is a magnificent fern, new to North America, and found near the matchless Shasta, we give it the popular name, in the catalogues, of "New Shasta fern."

All but one species of ferns are terrestrial. This one (*Ceratopteris thalictroides*) is aquatic, and is found in the everglades of Florida; the sterile frond floating on the water.

All but a few species are perennial, and nearly all of these, particularly the tree-ferns, are evergreen.

### The Origin of Ferns.

The first information we gather about the origin of ferns is recorded in a portion of the big book of nature—the everlasting rocks. Not inscribed in hieroglyphics or shadowed hints of fern existence, but harring the whole plant, or parts of it, entombed in their embrace.

In the Devonian age, or age of fishes, ferns first appear, rapidly increasing, both in number and size, up to the Carboniferous age, when we find them so abundant as to constitute often the bulk of certain coal strata, and to have been tree-like in form, 50 to 70 ft. in height, with trunks a foot to three ft. in diameter. They attain their best development, also, in the Carboniferous period, and from the fossilized specimens of parts of the trunks of the magnificent tree-ferns, their cellular structure is shown in a wonderfully beautiful manner. After this period it seems that the luxuriance of vegetation diminished, as if the earth, in its over-feeding of these beautiful cryptogams had become exhausted, so that one form after another disappeared, and the size of the remaining ones was greatly diminished, until we find them, as at the present age, with no apparent change since pre-historic days.

### The Life of a Fern.

The life of a fern begins from a spore, which is analogous to the seed of a flowering plant, and tends to the same result—the propagation of its kind. In structure, a seed and a spore are quite different; a seed having a definite rudimentary plant, while a spore contains nothing inside its cell-wall but a particle of protoplasm, or albuminous substances, with no vestige of a plant, no matter how highly magnified; hence, we are prepared to find that the growth of a fern must be entirely different at the outset from that of the flowering plant.

### Fern Sporangia.

These spores are always in little cases called *sporangia*, located on the back or underside of the frond. They are developed, in all instances, from the outer cells of the frond, upon which they are borne. The leaf tissue is often sacrificed to such an extent that the frond becomes greatly contracted, or the leafy portion entirely disappears and gives place to a mass of spore-cases, held together by the veins and skeleton of the frond, as in *Cryptogramme acrostichoides*.

When the numberless minute spores are ripe, the annulus, or ring, that surrounds the sporangium—being made of firmer material than the netted or reticulated case—springs open, rending the tender netted case at the sides, and the freed spores fly off into the air like dust, depositing themselves in the earth, in crevices of rocks and on tree trunks, or wherever the conditions are favorable for growth—that is, sufficient warmth, moisture and stillness. After a few days a greenish scum or film covers the damp surface. This is the first stage of fern life.

### Cell Wall of the Spore.

The outer cell wall of the spore is composed of a peculiar substance called cellulose; composed of  $C_6H_{10}O_5$ . This cell is broken by the warmth and moisture; the protoplasm, or cell contents, comes out and divides, forming minute new cells, which join themselves to the first cell, and continue the process until little shield-shaped structures appear, or are built up, standing at an angle of about 45°, growing thick together, resembling small scales, imbricating or overlapping, like the scales on a butterfly's wing, or, if magnified, would resemble the slate upon a roof. These minute scales (*prothallia*) are attached to the earth, a damp well, rock crevices or any favorable substance, by root-hairs, not true roots.

This first bed or prothallus, or pro-emhryo, is composed of cells filled with a green substance called chlorophyll, which gives it the usual bright, living, green color. On the under side of this *prothallus* are organs analogous to the stamens and pistils of flowering plants, and are called, respectively *antheridia*, containing the male element, equivalent to the pollen of flowers, and the *archegonia*, equivalent to the pistil and ovaries of the flowering plant. The *archegonia* are near the *sinus*, or upper notched edge of the *prothallus*, located just above the *antheridia*.

When these two different cells open, the ciliated *antherozoids*, being endowed with elasticity and motile power, uncoil, swarm out and some of them fall into the open cell of the tubelike *archegonia*, and at its base is located the mother-cell, called *oosphere*, or egg-cell, which it comes in contact with, when the *archegonia* immediately closes. Its hidden process of development goes on, and at length it is found that the central cell divides into four cells, the two lowest sub-dividing; then become imbedded in the substance of the prothallium. The two upper of the four cells sub-divide also, one developing into the plumule or first stem, the other into a radicle or first rootlet of the young fern. And so it springs into life—a fine example of what is termed alternation of generation.

### Another Method of Fern Growth.

Ferns are also reproduced by means of *gemmae*, or what is called *viviparous buds*, which grow on the stalk or surface of fronds; sometimes on the upper surface as in *Asplenium bulbiferum*, sometimes on the under surface as in *Cystopteris bulbifera*. In the *Cystopteris* they fall off and grow during the second season, but in most others remain and develop several fronds, still drawing sustenance from the parent plant.

This curious method of growth is traced through all plant life, from the lowest *Algae* to the highest *phanerogams*; especially does the tiger lily furnish striking examples in its detached axillary buds at the base of each leaf.

### Some Peculiarities of the Frond.

The frond or leaf of the fern seems capable in some instances of indefinite development in extension, or wonderful stretching out growth in the length of frond. Some show a dichotomous tendency of growth, i. e., forking at the tips of the frond. Sometimes the fronds develop a yellow or white farinaceous powdery substance, usually upon under side often in such abundance as to hide the delicate fruit and give name to the fern—as the gold back Cal. fern (*Gymnogramme triangularis*) or silvery plumefern (*Notholena Lemmonii*).

### Fern Literature of America.

Not till after our country had dated its century did any systematic work upon ferns, scientific or popular, appear from our American press. Much has been done abroad in reference to our ferns, by Sir W. J. Hooker; and later his son, Sir Joseph D. Hooker, with several others, has continued the work in bringing out general reports and descriptions of ferns and the rest of *Vascular cryptogams*. Since that time, in the year 1878, Prof. J. Robinson has issued a neat little work, "Ferns in Their Homes and Ours," full of interest and a valuable help to those who wish to cultivate these most graceful plants. Then followed an octavo volume on the "Ferns of Kentucky," illustrated with etchings from nature, by Mr. Williamson. Following close upon these came a check list of ferns, on a single sheet by Mr. Wm. Edwards of Natick, Mass., intended as a convenient medium of exchange.

In 1879 Mr. George E. Davenport published under the auspices of the Massachusetts Horticultural Society of Boston, a valuable and most instructive catalogue, or it might be called commentary, of some 40 pages, relating to the Davenport herbarium of North American ferns. In 1880 "A Systematic Fern-list of the Known Ferns of the United States of America, with the Geographical Range of the Species, and the Recognized Authorities for Nomenclature," was issued by Prof. D. C. Eaton, as an accompaniment to his large, exhaustive and finely illustrated work on "Ferns of North America." This comes to us in two large volumes of over 600 pages—not mere picture books of ferns, but they stand in the first rank, as a work of close, scientific research, a very present help to a close study of the ferns of our Pacific coast. The results of these studies it becomes a real pleasure to report.

### New Ferns of the Pacific Coast.

The new ferns, or those but lately discovered and described, are ten in number:

*Notholena Newberryi*, Eaton.  
*Notholena Grayi*, Davenport.  
*Notholena Lemmonii*, Eaton.  
*Notholena nivea*, Desveraux.  
*Cheilanthes Wrightii*, Hooker.  
*Cheilanthes viscidula*, Davenport.  
*Cheilanthes Cooperi*, Eaton.  
*Cheilanthes Clevelandii*, Eaton.  
*Aspidium Nevadaense*, Eaton.  
*Aspidium mohrioides*, Bory.

Three of these, *Notholena Grayii*, *Notholena Lemmonii* and *Notholena nivea*, were only detected last season, in Arizona, and hence are not described and illustrated in Eaton's "Ferns of North America." These, with the peculiar and hardly less interesting *Aspidium mohrioides*, will be described in a general way in conclusion with the uses of ferns.

The *Notholena Grayi*, *Lemmonii* and *nivea* are all small, delicate and fragile, white-powdered beneath, growing in nearly the same locality—Mt. Santa Catarina and Mt. Graham, southeast Arizona. The two first are plume-like, the latter pyramidal in outline.

The *Notholena Grayi*, Davenport, is a beautiful little fern, growing from four to six inches in height, is broad-lance shaped in outline, but simulating a plume-tip. The stalks are few in number, and rise from a knobby or nodose root-stalk, growing in clumps on the grassy slopes of the foothills, under the shade of rocks. It was found many years ago by Mr. Schott, in Sonora, Mexico, but owing to the meager, fragmentary specimens, it being fragile and difficult to preserve, it was supposed to be portions of some other fern, and so was passed by, till again collected within the boundary of North America, by Wm. M. Courtis, in February or March, 1880, in southeast Arizona, the exact locality not reported, and by Mr. Lemmon in April of the same year, in Sanicita valley, Patagonia mountains of southern Arizona. Larger and finer plants were collected in August on the foothills of Mt. Graham, near Camp Grant, southeast Arizona. Mr. Davenport describes it as a lovely fern and quite different from any known species, and so cannot be compared. Under the microscope the white powder separates into distinctly stalked, gland-like bodies, with enlarged, conical, flat or inverted heads, like a miniature host of fungi, with their variously shaped cups. The little brown scales that, with the powder, give it such rich color, under a power of 200 diameters, become like

long, tapering tubes, which contain the brown coloring matter, which, collected at the base or at intervals throughout the scale, gives it the appearance of being jointed. It is a beautiful object for the microscope. Mr. Davenport concludes: "This species is one of the most elegant yet discovered, and I take pleasure in dedicating it to one pre-eminent in American botanical science—Dr. Asa Gray."

### Notholena Lemmonii, Eaton.

(Lemmon's silvery-plume *Notholena*): During the same exploring expedition Mr. Lemmon fortunately detected a beautiful, silvery, plume-like *Notholena*, appearing unlike any he had ever before seen. With eagerness he secured all the specimens possible, together with a few live roots from among the clefts of granite rocks. Its known habitat is in two ravines on the southern side of the Santa Catarina mountains, at an elevation of about 6,000 ft., and about eight miles from Fort Lowell. These fragile but carefully prepared specimens were sent on to Prof. Eaton, and be at once replied: "Your No. 15 appears to be a new *Notholena*." In the next issue of the Bulletin of the Torrey Botanical Club, June, 1880, be publishes a description of the fern under the above name. The close botanical description is also in its classified place with our Pacific coast ferns.

### Notholena nivea, Gillies.

(The snowy *Notholena*.) In the following month, the same party, while at Tombstone mining along the granite comb above, regardless of the millions of rich quartz beneath his feet, discovered on this granitic eminence, at about 6,000 ft. elevation, a delicate, snowy *Notholena*, which, upon close inspection, proved to be the *Notholena nivea*, its appearance true to its name. It was first discovered in Mexico, and as far south as Peru, but this is its first recognized welcome to our own land.

It is a very pretty and interesting fern, with prim, black, wiry and polished stalks supporting its pyramidal fronds, that thus stand rather proudly, beckoning, as it were, to the prospector, and hinting, by its silvered pinnules, flecked with golden fruit, that untold treasures of silver and gold are bidden in the silence of the rocky bed beneath. This species is also technically described in its proper order of analysis of the ferns of the Pacific coast.

### Aspidium Mohrioides, Bory.

(The new Shastashield fern.) We come finally to speak of the most interesting discovery in ferns that has occurred for many years—the magnificent evergreen, full-fruited *Aspidium*, before spoken of as being found only at two widely removed stations on the globe, the southern part of South America and here, 6,000 miles distant in northern California, near Mt. Shasta.

This fern slightly resembles full-fronded specimens of *Aspidium aculeatum* variety *scopulinum*, but is of a brighter, richer green, with pinnatifid or many-winged pinna; its fruit abundant, and so crowded upon the back of the frond that the very large covering over the spor cases or fruit are lapped or imprinted, like saucers on a sideboard; an appearance that is preserved in many of the herbarium specimens to a remarkable degree.

On the 8th of July, in '78, Mr. Lemmon discovered this fern near the headwaters of the Sacramento river, on the south side of Mt. Eddy, 20 miles west of Mt. Shasta. It grows around granite boulders, in moist places, accompanied by the varieties of *Aspidium aculeatum*, the *Scopulinum* or "little brush fern." This association and close resemblance of the two ferns has no doubt caused the escape from detection heretofore.

This circumstance of location also opens the door to a wide field of inquiry, as to why these closely resembling yet structurally different forms should be found in juxtaposition. Which is the pioneer possessor of the soil? Which is the usurper, simulating the livery of the rightful heir and encroaching upon his domains? Or is there some subtle power in the elements of earth and air generated or tempered by the proximity of the lofty Shasta, that modifies and blends these gentle, passive ferns into almost like forms.

### Little Known Ferns.

There are several little known ferns, found at long intervals of time by some especially sharp-eyed explorer—perhaps seen only once along the Mexican boundary. In some instances the specimens are meager, being but a single frond, or only a few segments of a frond. Of these, Prof. Eaton entertains the hope that some one will be so fortunate as to find some of the ten at least, or, as he adds, re-discover the *Notholena tenera*, the tender little cloakless wanderer; *Cheilanthes microphylla*, the small leafy fern; *Cheilanthes leucopoda*, the white-stalked fern; *Pellaea pulchella*, the most beautiful little cliff-brake; *Pellaea aspera*, the rough cliff-brake; *Adiantum tricholepis*, the silky-leaf maiden-hair; *Adiantum tenerum*, the tender-leaf maiden-hair; and *Asplenium septentrionale*, the northern spleenwort—all the above named being reported from the southern boundary. In the other direction, among the islands of Alaska, the *Cheilanthes argentea*, of Hooker, the silvery fern, is supposed to be found, as it is abundant on the northern coast of Asia.

This subject about canvasses the subject of our Pacific coast ferns, and we will close by brief reference to the

### Uses, Benefits, etc., of Ferns

In general. Thus far ferns have contributed more to aesthetic taste, ever and always a delight to the eye, than to serve for extensive practical use. Some species are justly reputed, however, to have fine medicinal qualities. To

illustrate: within a few months past it has been discovered and strongly confirmed that the *Aspidium ripidum*, *var argutum*, found in the Oakland hills, is a powerfully effective yet harmless antihelmintic. In some parts of the world the young root-buds and tender fronds of certain ferns are cooked for food.

Referring again to the use of ferns as contributing to aesthetic taste, let us direct attention to the entertainment and exquisite pleasure to be derived from a close study of ferns, either in their native haunts, or by carefully preserved specimens in herbariums. Bearing upon this subject I cannot do better than to quote the words of John Robinson, who has some fine practical thoughts in his helpful book, "Ferns in Their Homes and Ours": "There is a large class of persons," he writes, "who are so fortunate (or unfortunate, according as they use or abuse the privilege) as to have nothing to do, or to speak more exactly, have to do only what they choose. This class must have a hobby or they will rust out. Another class are engrossed by hard professional work which leaves them every day tired and, perhaps, cross. These should have some outside hobby, or they will become one-sided and crabbed, and these will wear out." Botanical literature abounds with instances where eminent authors have been derived from these two classes of persons. Mr. Robinson continues: "Without an object we walk aimlessly, we read aimlessly and we work aimlessly. Without a hobby no great man would be great. Every person, old or young, outside of an insane asylum, should have some one thing in which an intellectual interest is taken. Forced to study what we detest, as often happens at school, we not only lose the time spent, but a listless habit is engendered; but if taken at the point on which our interest can be excited and led by skillful hands and clear heads, those whose lives would otherwise become dull and trivial, can be indirectly guided to much higher aims and attainments. The 'fern mania,' as it is called, which may be traced from Europe across the Atlantic, to its recent development in America, is a hobby vastly superior to most others.

The fern hobby, properly guided, can be the means of stimulating pure and healthy exercise, or pleasant and entertaining study; but whether pursued as a pastime or a study, in any event, it can do no harm, and may be the cause of great and permanent good.

In Syracuse, N. Y., there is a fern club, composed mostly of ladies, presided over by Mrs. Rust. This club has made extensive collections by discoveries and exchange. The members pursue the study with such zest, pleasure and success, that the knowledge of their club is spread world-wide, and its example is being extensively emulated.

## THE ENGINEER.

RAILWAY construction is rapidly progressing in Mexico, as will be seen from the following facts which we condense from *The Two Republics*: The Mexican National Construction Co. (Palmer & Sullivan) is laying track on its road from the city of Mexico to Toluca, and also on the division from Zacatecas towards San Louis Potosi. These two divisions give employment to about 15,000 men. The Mexican Central (Atchison, Topeka & Santa Fe) is pushing its road northward as rapidly as abundant means and a large force of men will carry it. About 11,000 men are employed on the line between the capital and Pula, and between the latter place and San Antonio there is a large additional force. Several iron bridges and stone culverts have been built. Sixty odd miles of road are graded, and care are running 53 miles from the capital. The Morelos railway, owned by a local company, is completed to Ozmumba. Sixty-two miles of road are in running order, and iron is being laid on 10 miles more. So far 152 iron and stone bridges have been built on this road over streams and canyons. The road is owned and managed entirely by Mexicans. All the roads now being constructed in Mexico are increasing their working force for the purpose of completing as much work as possible before the rainy season commences. The managers of the Sonora railway are getting laborers from the mining camps of Arizona. Twenty-two miles of the Hidalgo railway are in running condition.

PROJECTS.—A company has been organized for the construction of a narrow-gauge road from Galveston and Houston, Texas, to Corpus Christi, where it will connect with the Corpus Christi, San Diego & Rio Grande road, lately acquired by the Palmer & Sullivan syndicate and now being extended to the Rio Grande. This is another step in the movement for a continuous narrow-gauge system from the northern lakes to Mexico. A corporation has been formed in Boston to construct and operate a road in the Argentine Republic 130 miles in length.

THE NORTHERN PACIFIC.—We learn from an official source that the Northern Pacific railway will be lengthened 400 miles the present year. This will leave a gap of 450 miles between the western terminus of the eastern section and the eastern terminus of the Columbia river section, and a second gap of 150 miles between the Columbia river and Puget sound. The entire length of the road when completed will be 2,700 miles.

RAILROAD BUILDING IN THE UNITED STATES. With one single exception, there were more miles of railroad built last year than heretofore in the history of the Union. Fifty years ago (1830) there were but 23 miles of railroad in the United States. Ten years later (1840) the lines had extended to 2,818 miles. At the end of the next decade (1850) there were 9,021 miles; and, according to the reports for 1860, the railroads of the country had reached 30,635 miles. And within the next 10 years, which embraces the period of the civil war, the mileage was nearly doubled. Ere the mutterings of the war had died away the recuperative power, enterprise and genius of the American people were revealed as never before, in establishing and extending the lines of travel and commerce, so that in 1871, the mileage of new road completed amounted to the enormous amount of 7,670 miles. During last year 5,206 miles of track were laid down.

HUDSON RIVER TUNNEL.—According to the *Railway News* the Hudson River tunnel is advancing satisfactorily toward the New York shore at the rate of five ft. a day. Two hundred men are employed digging out the dirt and putting in the iron and brick work. The tunnel is finished as they go along, and the work is much safer than under the old plan, which resulted so disastrously. A small tunnel, about six ft. in diameter, is run ahead of the larger tunnel, which follows and incloses it; warning is thus given of the nature of the soil. The work is now in the south tunnel, which is now completed 290 ft. from the shaft, and will soon be out as far as the north tunnel, which has been cleaned out, but not extended, since the accident. Both tunnels will then be carried along together. A caisson is in course of construction for beginning the work on the New York side.

STEAM ENGINE RUNNING.—In a recent number of the *Engineer* (London) it was asserted that "no steam engine has yet been made which will run continuously and quite steadily for long periods of time at 600 revolutions per minute." In reply, a correspondent writes to the same paper that an engine invented by a Mr. Brotherhood, of London, and which has been in use for some time for working Mr. Brush's and other kinds of dynamo-electric machines, is found to work at a higher speed even than 600 revolutions very satisfactorily.

## USEFUL INFORMATION.

### Industrial Secrets.

A century ago, what a man discovered in the arts he concealed. Workmen were put upon an oath never to reveal the process used by their employers. Doors were kept closed, artisans going out were searched, visitors were rigorously excluded from admission, and false operations blinded the workmen themselves. The mysteries of every craft were hedged in by thickets of empirical pretensions and judicial affirmation. The royal manufactories of porcelain, for example, were carried on in Europe with an esprit of jealous exclusiveness. His Majesty of Saxony was especially circumspect. Not content with the oath of secrecy imposed upon his workpeople, he would not abate his kingly suspicion in favor of a brother monarch. Neither king or king's delegate might enter the tabooed walls of Meissen. What is erroneously called the Dresden porcelain—that exquisite pottery of which the world has never seen its like—was produced for 200 years by a process so secret that neither the bribery of princes nor the garrulity of the operatives revealed it.

Other discoveries have been less successfully guarded, fortunately for the world. The manufacture of tinware in England originated in a stolen secret. Few readers need be informed that tinware is simply thin iron plated with tin by being dipped into the molten metal. In theory, it is an easy matter to clean the surface of iron, dip it into a bath of boiling tin, remove it enveloped with a silvery metal to a place of cooling. In practice, however, the process is one of the most difficult in the arts. It was discovered in Holland, and guarded from publicity with the utmost vigilance for more than half a century. England tried in vain to discover the secret, until James Sberman, a Cornish miner, insinuated himself master of the secret, and brought it home. The secret of manufacturing cast steel was also stealthily obtained, and is now within the reach of all artisans.

THE POPULATION CENTER OF THE UNITED STATES.—Ten years ago the center of the population of the United States was about 48 miles east of Cincinnati, Ohio. The Superintendent of the late census announces that the growth of the great West during the past decade carried the center of population about 50 miles west, while the large increase in the Southern States carried it a little southward. The result places the center of population within the limits of Cincinnati.

TO GET RID OF RATS.—Get your trap in your mill and catch one alive. Paint him a bright red color and let him go. Then put your trap in another place in the mill and catch another and likewise paint him and let him go. Your rats will soon disappear from the premises. Try it.

JUTE FOR BRUSSELS CARPETING.—A patent has been taken out in France by M. L'Heureux, which rests upon the jute in the manufacture of so-called Wilton or Brussels carpeting, which hitherto has been made from wool. The application of jute for this purpose is facilitated by the preparation of a portion of jute yarn into what is called the "Camel," and by the varying proportions of the number of the yarn made use of for the web and the main warp. The jute yarn is fermented for about 10 or 12 hours in a solution formed of 50 quarts of water and one lb. of alum, these proportions to be used for working about 90 lb. weight of thread. After the jute has thus been cleared of the oil it may have gathered during its progress through the various processes of the spinning mill, that is to say, after it has been disinfected, it is dyed if required in the ordinary way; the jute is then sized with the following preparation, one lb. of starch dissolved in 90 quarts of water; the same weight of jute is submitted to the weight of sizing above-named. The warp is prepared and dried in the customary manner. The weaving is carried out on looms, such as are used in weaving velvet, and therefore it does not require special observations. Carpets made in this way can be produced at a reasonable price. —*Fils et Tissus*.

PHOSPHOR TIN.—An alloy of tin with phosphorus has been in use in Germany for some time for making phosphorus bronzes. A practical man gives it as the result of his experience that such a compound must contain at least 9% of phosphorus, else part of the tin will remain uncombined. If more than 9% of phosphorus is introduced, the excess will be oxidized and volatilized, because the tin is unable to take up and hold more than a certain quantity of phosphorus. A compound containing 9% of phosphorus corresponds to the formula  $P_2Sn^5$ , corresponding to the higher oxide  $P_2O_5$ .

MEAT THIRTY YEARS OLD.—The *Analyst* for December contains a statement that a can of preserved meat over 30 years old has been examined, consisting of veal with considerable fat, and a few peas, which were found to be in a good state of preservation. An analysis showed only 0.68% of ash, which was entirely free from lead, and contained only minute traces of tin.

TO REMOVE THE BLUE COLOR IMPARTED TO IRON AND STEEL BY EXPOSURE TO HEAT.—Rub lightly with a sponge or rag dipped in diluted sulphuric, nitric or hydrochloric acid. When the discoloration is removed, carefully wash the article, dry it by rubbing, warm it and give a coat of oil or it will rapidly rust.

## GOOD HEALTH.

### Hot and Cold Baths.

The London *Lancet* in a recent number points out the difference between the effects of hot and cold baths. The effects of the cold bath, it says, being mainly due to impressions made upon the cutaneous nerves, the modifications of the cold bath largely depend on their power of increasing its stimulating action. The colder the water the more violent the impression. The frequent change of water, such as is found in the sea or in running streams, increases the stimulating effect. Great force of impact, as when water falls from a height or comes forcibly through a hose upon the body; the division of the stream, as is seen in shower baths and needle baths, and the addition of acids or salt to the water, all act, it would seem, by increasing the stimulating power which the water exerts upon the cutaneous nerves.

Warm baths produce an effect upon the skin, directly contrary to that brought about by cold water. The cutaneous vessels dilate immediately under the influence of the heat; and although this dilation is followed by a contraction of the vessels, this contraction is seldom excessive, and the ultimate result of a warm bath is to increase the cutaneous circulation. The pulse and respiration are both quickened, as in the cold bath. The warm bath increases the temperature of the body, and by lessening the necessity for the internal production of heat, decreases the call made upon certain vital processes, and enables life to be sustained with a less expenditure of force. While a cold bath causes a certain stiffness of the muscles, if continued for too long a time, a warm bath relieves stiffness and fatigue. The ultimate results of hot and cold baths, if their temperature be moderate, are about the same, the difference being to use the words of Braun, that "cold refreshes by stimulating the functions, heat by physically facilitating them; and in this lies the important practical difference between the cold water and the hot water systems."

HYDROPHOBIA VIRUS.—That obscure poison which produces hydrophobia has been known to lie latent in the human system for years before developing its fatal results. M. Pasteur asserts that the supposition is well supported that the virus does develop in certain organs, and not, as in other cases, in the blood; and that when, after a period variable according to circumstances, the organized poison passes into the blood severe symptoms come on rapidly, and the victim soon dies. An explanation substantially the same as this had long been advanced as a mere theory, but now M. Pasteur advances it as an ascertained physiological fact.

SUNDAY DINNER.—Sunday, by a large majority of mankind, is made a day of feasting, and the Sunday dinner is the principal one of the whole week. If there is any scrimping it is done through the week and the strength of the purse and efforts of the housewife are both concentrated and brought to a focus upon a Sunday dinner. Sunday is said to be a day of rest; but very little rest does the stomach find when it is loaded with an assorted cargo of highly seasoned viands, which gives it a job of overwork. And this is more onerous and provoking, as its owner lounges around and takes little or no exercise, which leaves the other organs without employment, and the poor stomach has to work on all alone, although it often exercises its constitutional right of grumbling at its owner's indiscretion and gluttony, which hath such extent that by the close of the day he feels much like a stuffed anasconda. If the quantity of food we eat is to be regulated by the exercise of the body, then the Sunday meal should be the lightest of the week, as usually but little physical exercise is taken on that day, whereas the contrary is the fact and the appetite is nursed and whetted throughout the week that it may make an onslaught on the fat of the land on Sunday, which is a manifest impropriety and a gross violation of the laws of health.

CHLORAL FOR TOOTHACHE AND FACEACHE.—Dr. Sporer in a St. Petersburg medical journal, after referring to the great benefit he had derived from chloral, whether administered internally or as an embrocation dissolved in almond oil, for the relief of rheumatism and other pain, states that in toothache and its accompanying facial pain a most effective remedy is found in dissolving from a scruple to half a drachm in two drachms of glycerine, and applying a plug of wadding soaked in this to the carious tooth. As, however, this causes in some cases considerable irritation of the mucous membrane of the mouth, he has during the last four years always applied the chloral in substance. From a half to at most one grain of the granules of chloral are wrapped in a little wool to keep them together, and placed in the cavity of the tooth. When the chloral has dissolved the accumulated saliva is to be spit out. If the tooth is in the upper jaw the chloral should be kept on by the finger until dissolved. The most violent toothache is in a few minutes relieved. He cites some cases in which most distressing and long-aiding toothache, accompanied by severe prosoptalgia, was thus promptly cured.

EFFECTS OF TEA ON THE SKIN.—If you place a few drops of strong tea upon a piece of iron, a knife blade for instance, the tannate of iron is formed which is black. If you mix tea with iron filings, or pulverized iron, you can make a fair article of ink. If you mix it with fresh human blood, it forms with the iron of the blood, the tannate of iron. Take human skin and let it soak for a time in strong tea; and it will become leather. Now, when we remember that the liquids which enter the stomach are rapidly absorbed by the venous absorbents of the stomach, and enter into the system by the skin, lungs and kidneys, it is probable that a drink so common as tea, and so abundantly used, will have some effect. Can it be possible that tannin, introduced with so much liquid-producing respiration, will have no effect upon the skin? Look at the tea-drinkers of Russia, the Chinese, and the old women of America, who have so long continued the habit of drinking strong tea. Are they not dark-colored and leather-skinned?

LONGSIGHTEDNESS.—The explanation of longsightedness (or farsightedness), which commonly occurs in old people, is a very simple one. The eye becomes flattened by a diminution of its fluids, or some structural change takes place in the crystalline lens by which its convergent power is diminished. The images of objects near the eye, therefore, are indistinct, because the rays of light proceeding from them are slightly divergent, and the converging power of the crystalline lens is inadequate to focus them upon the retina, but tend to focus the rays behind it. This defect is remedied by the use of convex glasses, which make up for the weakened convergent power of the eyes. With such aids, the rays from objects near at hand are rendered parallel or slightly convergent before entering the eye, thus enabling a distinct image to be formed upon the retina.

TOOTH TRANSPLANTING.—It often happens that a front tooth is broken off even with the gum, while the rest of the teeth remain good. This root may be removed and its place supplied with a sound, healthy tooth, previously removed for that purpose, and made to grow and perform all the functions of a natural tooth. A number of operations of this kind have been successfully performed by Dr. C. B. Stoddard, of Austin, Texas. As a rule, the teeth are selected from the mouths of healthy negroes, and the price paid from \$3 to \$10. Some of the most fastidious ladies in the State have had this operation performed, and are justly proud of the fact.

EGGS VS. MEAT.—According to Dr. Edward Smith, an egg contains 15 1/2% of carbon and 2% of nitrogen. Another writer estimates that the value of 1 lb. of eggs, as food for sustaining the active forces of the body, is to the value of 1 lb. of lean beef as 1,534 to 900. As a flesh producer, 1 lb. of eggs is about equal to 1 lb. of beef.

## TABLE OF CONTENTS.

GENERAL EDITORIALS.—Mining in Sierra County; Screw Hoisting Machine; Fraudulent Assessments; Mines of Sonora, Mexico, 209. The Week; The State Mining Bureau; An Important Mining Decision, 216-17. Leaching Gold and Silver Ores, 217. Patents and Inventions; Notices of Recent Patents; Glove Making in San Francisco; The Mechanics' Fair, 220.

ILLUSTRATIONS.—Harrington's Portable Double Chain Screw-Hoisting Machine, 209. Device for Saving Flots Gold, 217.

MECHANICAL PROGRESS.—Metals and Paints; Improved Lacs Machines; Cementing Labels to Metals; To Keep Gun Barrels from Rusting; Destructive War Implements; A Compound Air Engine, 211.

SCIENTIFIC PROGRESS.—Detecting Gas Leaks; Manganese Metal in the Arts; The Atmosphere of Celestial Bodies; Rectifying Alcohol; Live Steam; Bleaching by the Electric Light; Novel Experiment; Effect of Cold on Magnetized Steel; The Sense of Colors; Electric Tides; Microscopic Machinery; A New Safety Lamp, 211.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 212.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 212-13.

THE ENGINEER.—The Northern Pacific; Projects; Railroad Building in the United States; Hudson River Tunnel; Steam Engine Running, 215.

USEFUL INFORMATION.—Industrial Secrets; The Population Center of the United States; To Get Rid of Rats; Jute for Brussels Carpeting; Phosphor Tin; Meat Thirty Years Old; To Remove the Blue Color Imparted to Iron and Steel by Exposure to Heat, 215.

GOOD HEALTH.—Hot and Cold Baths; Hydrophobia Virus; Sunday Dinner; Chloral for Toothache and Faceache; Effects of Tea on the Skin; Longsightedness; Tooth Transplanting; Eggs vs Meat, 215.

MISCELLANEOUS.—An Improved Steam Pinnaque; Only a Trespass; Industrial Partnership; Does Mining Pay; A Ruined City; French Merchant Shipping, 210. The Ferns of the Pacific Coast, 214. Miners' Wages, 218.

NEWS IN BRIEF, on page 220 and other pages.

## The Week.

In our comprehensive and condensed "Mining Summary" on another page will be found all the current mining news of the week. A perusal of this Summary will show pretty well what work is going on, and how very active the whole mining interest is.

The decision, given elsewhere, on what is known as the Burke-Bonanza suit, is well worthy of careful perusal by all stockholders in mining companies, as the principles there laid down are very important.

It will be seen from looking over our columns that a good many mining sales are now being consummated. The one to Scotch capitalists, of a mine in Sierra Co. is mentioned elsewhere. These sales prove that capitalists who know what they are about still think there is plenty of room for investment in California mines, without going to newer and more unsettled countries, where labor and supplies cost more than they do here.

Although the prospects for the interior of California for this year are good, in the city business is a little dull, but our home resources are sufficient to bring California out all right in the end.

HIGH EXPLOSIVES.—We shall begin in our next issue a series of articles on high explosives, which will be of great interest to all powder manufacturers and consumers. The first of the series will be on "Gun Cotton."

THE Starr-Grove Mining Co. of Nevada has declared a dividend of 10 cents per share, aggregating \$20,000, payable in New York on the 31st.

## The State Mining Bureau.

It will be recollected that when the Governor of this State sent his message to the Legislature he called special attention to the report of the State Mineralogist, and to the importance of the State Mining Bureau. He said: "The Act organizing the State Mining Bureau was one of the wisest measures passed at the last session. It is destined, if properly and judiciously fostered, to bring into active light many of the hidden resources of the State, and to impart, through the practical knowledge of its officers, the benefits which such discoveries yield."

"The State should appropriate a sufficient sum to defray the salaries and running expenses of this Bureau, leaving the amount collected 'as taxes on the issue of certificates of stock corporations,' for the sole purpose of purchasing specimens, preparing, arranging and analyzing them, and such other expenditure as may be rendered necessary for the practical benefit of the citizen."

"I have been informed that many very valuable and in some instances, exceedingly rare donations would be made to the Bureau were the same located in a building capable of showing them to advantage, and safe as a repository. To do this it will be necessary to change the present location, and as the value of the gifts would be greater than the outlay for rent, I deem it advisable such change should be made, and, in connection therewith, I would recommend that the mineral cabinet now hid away in our State Library be transferred to the care of the bureau, whose proper functions it is to care for it."

During the last session, in accordance with the above suggestion by the Governor. Mr. Wasson introduced a bill appropriating \$10,000 a year for two years to outfit the State museum. Through lack of time the bill was not passed.

The general appropriation bill which is to be passed at the extra session is to contain only "items required to pay the salaries of State officers, the expenses of the Government and of the institutions under the exclusive control and management of the State."

It is therefore possible to appropriate the \$10,000 a year toward the State Mining Bureau and put it on a good firm basis immediately. Now it is suffering from lack of funds. The rooms are not sufficiently spacious for the wants of the museum, and larger apartments have become necessary.

It is to be hoped that members of the Legislature will see fit to appropriate the sum mentioned toward the Bureau, now one of our most useful State institutions. The mining interest of the State will be ultimately benefited by this money. The Bureau has shown itself a useful and practical institution. The number of daily visitors is gradually increasing as the Bureau becomes known, and the accumulation of specimens has been so rapid as to outgrow the convenience for their reception.

The collection formerly at the State library, and what has been turned over to the bureau by the Legislature, cost over \$20,000. Mr. Hanks has not had it moved here because his rooms are not large enough for the important addition.

We sincerely hope that this important appropriation will receive proper consideration, and that the Bureau will receive the money it so much needs. The Bureau is not only a place for the exhibition of minerals. Its officers answer correspondence of all kinds relating to mining and metallurgy; they collect information on these subjects to be published in future reports; collect books and maps, and in fact attend to all those things connected with the mining interests, which should have long ago received proper attention.

## Trade-Marks.

When, last year, the courts decided that the existing laws relative to United States trade-marks were unconstitutional, those persons whose trade-marks had become of great value to them in their business, were naturally much chagrined. Many trade-marks had become so well known as to be worth thousands and thousands of dollars to their owners. It was like taking, in many instances, half the capital out of the business, to make the trade-mark valueless by removing the exclusive right to its use. The declaration of unconstitutionality of the law which gave originators vested rights in their trade-marks, was the cause of profound regret; yet at the same time it was felt that the Government, having received money for granting the privileges, would ultimately provide a law to meet the requirements, which would be constitutional.

A new act was carefully prepared and passed by the 46th Congress, receiving the approval of the President on the 3d of March. The Patent Office is now engaged in preparing rules and forms for the information and guidance of persons seeking to register their trade-marks. As soon as these are finished, applications for registration can be forwarded, and the MINING AND SCIENTIFIC PRESS Patent Agency will be prepared to prosecute Government trade-mark cases as formerly.

An examination of the law shows that it differs from the act of 1870 on the subject, in that it authorizes the registration of trade-marks

only by persons who are owners of trade-marks which are used in commerce with foreign countries or with the Indian tribes, and who are domiciled in the United States or in a foreign country which, by treaty, convention or law, permits citizens of the United States to register trade-marks. The new act seems to have been drawn in substantial acknowledgment of this propriety of the decision of the Supreme Court, which held that Congress had no right to regulate even the registration of trade-marks by citizens of the United States who were dealing only within this country. Owners of trade-marks which are chiefly or entirely used on merchandise of home consumption are, as heretofore, protected by common law, while the Registration Act merely authorizes the registration of trade-marks that relate to merchandise used in foreign commerce.

This following is the full text of the new law:

Be it enacted by the Senate and House of Representatives of the United States in Congress assembled, That owners of trade-marks used in commerce with foreign nations or with the Indian tribes, provided such owners shall be domiciled in the United States or located in any foreign country or tribes which, by treaty, convention, or law, affords similar privileges to citizens of the United States, may obtain registration of such trade-marks by complying with the following requirements: First, By causing to be recorded in the Patent Office a statement specifying name, domicile, location and citizenship of the party applying; the class of merchandise and the particular description of goods comprised in such class to which the particular trade-mark has been appropriated; a description of the trade-mark itself, with fac-similes of the mode of the mode in which the same is applied and affixed to goods and the length of time during which the trade-mark has been used.

Second, By paying into the Treasury of the United States the sum of \$25, and complying with such regulations as may be prescribed by the Commissioner of Patents.

Sec. 2. That the application prescribed in the foregoing section, must, in order to create a right whatever the favor of the party filing it, be accompanied by a written declaration verified by the person, or by a member of a firm, or by an officer of a corporation applying, to the effect that such party has at the time a right to the use of the trade-mark sought to be registered, and that no other person, firm, or corporation has the right to such use, either in the identical form or in any such near resemblance thereto as might be calculated to deceive, that such trade-mark is used in commerce with foreign nations or Indian tribes, as above indicated; and that the description and fac-similes presented for registry truly represent the trade-mark sought to be registered.

Sec. 3. That the time of the receipt of any such application shall be noted and recorded. But no alleged trade-mark shall be registered unless the same appear to be lawfully used as such by the applicant in foreign commerce or in commerce with Indian tribes, as above mentioned, or is within the provision of a treaty, convention, or declaration with a foreign power; nor which is merely the name of the applicant; nor which is identical with a registered or known trade-mark owned by another and appropriate to the same class of merchandise, or which so nearly resembles some other person's lawful trade-mark as to be likely to cause confusion or mistake in the mind of the public, or to deceive. In an application for registration the Commissioner of Patents shall decide the presumptive lawfulness of claim to the alleged trade-mark; and in any dispute between an applicant and a previous registrant, or between applicants, he shall follow, so far as the same may be applicable, the practice of courts of equity of the United States in analogous cases.

Sec. 4. That certificates of registry of trade-marks shall be issued in the name of the United States of America, for recording in the Patent Office, and the interior, and shall be signed by the Commissioner of Patents, and a record thereof, together with printed copies of the specifications, shall be kept in books for that purpose. Copies of trade-marks and of statements and declarations filed therewith and certificates of registry so signed and sealed shall be evidence in any suit in which such trade-marks shall be brought in controversy.

Sec. 5. That a certificate of registry shall remain in force for 30 years from its date, except in cases where the trade-mark is claimed for and applied to articles not manufactured in this country, and in which it receives protection under the laws of a foreign country for a short period, in which case it shall cease to have any force in this country by virtue of this act at the time that such trade-mark ceases to be exclusive property elsewhere. At any time during the six months prior to the expiration of the term of years of such certificate of registry it may be renewed on the same terms and for a like period.

Sec. 6. That applicants for registration under this act shall be credited for any fee or part of a fee heretofore paid into the Treasury of the United States with intent to procure protection for the same trade-mark.

Sec. 7. That registration of a trade-mark shall be prima facie evidence of ownership. Any person who shall reproduce, counterfeit, copy, or colorably imitate any trade-mark registered under this act and affix the same to merchandise of substantially the same description and properties as those described in the registration shall be liable to an action on the case for damages for the wrongful use of said trade-mark at the suit of the owner thereof; and the party aggrieved shall also have his remedy according to the course of equity to enjoin the wrongful use of such trade-mark used in foreign commerce or commerce with Indian tribes, as aforesaid, and to recover compensation therefor in any court having jurisdiction over the parties, or in the Supreme Court of the United States. The United States shall have original and appellate jurisdiction in such cases without regard to the amount in controversy.

Sec. 8. That no action or suit shall be maintained under the provisions of this act in any case when the trade-mark is used in any unlawful business or upon any article injurious in itself, or which mark has been used with the design of deceiving the public in the purchase of merchandise, or under any certificate of registry fraudulently obtained.

Sec. 9. That any person who shall procure the registry of a trade-mark, or of himself as the owner of a trade-mark, or an entry respecting a trade-mark, in the office of the Commissioner of Patents, by a false or fraudulent representation or declaration, orally or in writing, or by any fraudulent means, shall be liable to pay any damages sustained in consequence thereof to the injured party, to be recovered in an action on the case.

Sec. 10. That nothing in this act shall prevent, lessen, impair, or avoid any remedy at law or in equity which any party aggrieved by any wrongful use of any trade-mark might have had if the provisions of this act had not been passed.

Sec. 11. That nothing in this act shall be construed as unfavorably affecting a claim to a trade-mark after the term of registration shall have expired; nor to give cognizance to any court of the United States in an action or suit between citizens of the same State, unless a trade-mark controversy is used on goods intended to be transported to a foreign country, or in lawful commercial intercourse with an Indian tribe.

Sec. 12. That the Commissioner of Patents is authorized to make rules and regulations and prescribe forms for the transfer of the right to use trade-marks and for recording such transfers in his office. The citizens and residents of this country wishing the protection of trade-marks in any foreign country, the laws of which require registration here as a condition precedent to getting such protection there, may register their trade-marks for that purpose as is above allowed to foreigners, and have certificate thereof from the Patent Office.

Approved March 2, 1881.

## An Important Mining Decision.

Judge Sullivan on Wednesday decided the case of John H. Burke et al. against James C. Flood, the Con. Virginia Mining Co., James C. Flood and James V. Coleman, executors of the last will and testament of William S. O'Brien, deceased.

This suit was for the alleged conversion to their own use, by the bonanza firm, of about 70 ft. of mining ground, which, while acting as trustees of the company, they purchased for their own account, instead of for the company.

The principles involved in this suit are of greater importance than the money question, in which respects it is the least of the several suits instituted by the stockholders. Counsel on both sides occupied several days in the discussion of its legal aspects, and the Court devoted a week specially to the investigation of authorities and making up its decision, which will probably go to the Supreme Court for revision.

The other suits, relating to the claims for slimes and tailings, the milling of the ore, furnishing supplies, etc., for which some thirty or forty million of dollars are claimed, have yet to be tried, and are the main matters of contest.

This decision, if sustained by the higher courts, will result in the restoration to stockholders of the bonanza mines of about \$1,000,000. This dividends that have been paid on the 9,000 and odd shares of Con. Virginia and California amount to \$693,278.50, which, with interest to date, will swell the restitution to a round million.

The following is a carefully prepared abstract of the decision.

### Statements of the Complaint.

A great deal is charged in the bill, and much more was stated in the argument of the propositions of law involved in this case, to the effect that the members of the firm of Flood & O'Brien had in these transactions been guilty of actual, intentional, willful fraud, had been guilty of a deliberate attempt to defraud the corporation, defendant and its stockholders of their property. I do not think that the evidence justifies the charge of actual or willful fraud. The ground which was sold to the corporation defendant by the defendants was sold for exactly the same equivalent as was paid to every other party conveying ground to the corporation. Accordingly in what follows, I shall treat of these transactions as constructively fraudulent, and not as actually or willfully fraudulent.

### The Defense.

In the outset it is urged against this bill that the plaintiff has no right to maintain this action, because if any individual stockholder has a right to maintain such an action, he must be one who was a member of the corporation at the time of the alleged misappropriation of corporate assets, or, at all events, some one to whom such stockholder has assigned his right of action. This ground of objection is not a new one in actions of this kind.

### Dividends and Transfer.

On an accounting with the corporation and a distribution of its dividends among its stockholders, the dividends are not to be awarded to those who may long since have been stockholders, but to those who at the time of the distribution are possessed of the title deeds to its assets in the shape of certificates of stock. A transfer of a certificate of stock carries with it all the rights or claims which the holder has against the corporation. It is not necessary for him to make any formal assignment of a right of action against faithless directors. The instant he ceases to be a stockholder his right of action in a representative capacity ceases, and that of his successor begins.

### Who Caused the Injury.

But counsel for defendants contend that in no such controversy as the present can an individual stockholder institute and maintain an action of this kind. This injury, if any, which has been sustained, has been sustained by the corporation itself, they claim. If one person has sustained the injury, what right has another to intrude himself into the controversy and to arrogate to himself the fruits of the contest? The corporation, it is said, makes no complaint against its directors; why, then, should anyone else complain? Some confusion has arisen in considering this question, from the fact that this intangible, invisible, incorporeal entity which we term a corporation, has been invested with a character of mystery, by which it segregates itself from its constituent elements and retires from responsibility the exponents of its power.

### Asserting Rights.

Ordinarily, it is true, the corporation must assert its own right; and this it does through its directory or managing body, and the individual stockholder if bound by the action of the directory in the interest of the majority or ruling power of the corporation. Under normal conditions of honesty and regard for the law, the stockholder is held to have surrendered his individual judgment and interests to the presumably better judgment of the governing body. But the history of institutions of this kind proves that power perpetuates itself, and sometimes at the expense and entire disregard of justice and common honesty. Corporations have too often been the instruments by which bold and scheming men have under the forms and sanction of the law appropriated to their own use the property of their unsuspecting neighbors.

### Majority Power.

The unrestrained power of the majority in a corporation would lead to the absolute spoila-

tion of a defenseless minority. But the weak and the defenseless are always the special wards of the Chancellor. The more defenseless the suppliant who invokes the aid of the Chancellor, the stronger is the aim of the Chancellor to sustain him. Where the managing body of the corporation are guilty of fraud or oppression or gross disregard of the law, courts of equity will administer relief on the complaint of the individual stockholder. Courts of equity, in such cases, take a common sense view of matters, and regard the assets of the corporation as being in reality the property of the entire body of stockholders.

#### Court Interposition.

If it appears that the managing power of the corporation, acting in concert with an overpowering majority, are disregarding the dictates of honesty and fair dealing, and appropriating to itself the property of the minority, a court of equity will interfere at the suit of a single stockholder, howsoever small his proprietary interest in the corporation.

#### Rights of Directors of Corporations.

Have directors of corporations a right to deal with the corporations of which they are directors, for their individual profit, as distinguished from the profit realized by the body of stockholders? It would seem that it would be useless to discuss this proposition at any length. Our own Supreme Court has considered this question on a number of occasions, and its opinion on the subject is in accordance with the vast preponderance of authority.

#### Breach of Trust.

Measured by these rules, the conduct of the defendant Flood in making the sale to the company of which he was a director was a breach of the trust under which he held the office of Director. If from any of these transactions he realized a profit not common to the other stockholders or the corporation, he and those jointly interested with him in the transaction became answerable as involuntary trustees to the corporation for the amount of the profits so realized and the avails of such profit. Directors realizing secret profits from sales to the corporation, are as to the fund so realized the trustees to a constructive trust, and not as trustees of an express trust.

#### The Assets a Trust Fund.

Thus far we have reached this position: That a director is a trustee for the corporation and for the body of stockholders, and that the assets constitute a trust fund; that he is not permitted to deal with the trust fund for his own benefit; that if he does so deal with the fund for his own benefit he is guilty of a breach of trust, and he holds the profits of such transaction under constructive trust; that the corporation may call on him to account for such profits, and that in the event of failure or refusal by the corporation to exact an accounting by reason of its being under the control of the recent trustees, an individual stockholder may maintain the action. All this being assumed, it remains to be determined whether the defenses set up by the answer, and presented at the trial avoid or defeat the right of plaintiff in this action to a recovery.

#### Laches and Limitations.

The defense relied on are laches and acquiescence, ratification and the statute of limitations. These several defenses are clearly connected; they all tend to the proposition that, conceding that a valid claim ever did exist against the trading trustees, the same has been lost by lapse of time, or through the action or non-action of the corporation and its stockholders.

I do not consider that the evidence in this case discloses any such laches or acquiescence as would bar a right of action, unless it should be continued during the entire period fixed by the statute of limitations.

#### Ratification.

Ratification of a wrongful act of the trustee would in proper cases, and under proper circumstances, amount to a condonation of the offenses charged, and would operate as a release of any cause of action. But it is not every attempt to ratify which constitutes a ratification. The admitted facts of this case show that during all the time intervening between these transactions and the time of suit brought, the defendants, other than the corporation controlled and directed the corporation. It would seem to follow from that fact that any act of ratification in order to estop the corporation or its minority (!) stockholders from maintaining an action of this kind, would have to be something else than the action of the controlling majority. Otherwise it would follow that a director who could control a majority vote of the corporation could ratify his own wrongs, and present the spectacle of trustee defeating the rights of his *cestui que trust* by the operation of his own will.

Action of all the Stockholders Required. The ratification which will bar an action must be a ratification by the whole body of stockholders; the action of a majority is not sufficient. It must be the solemn and deliberate action of such whole body of stockholders done with a knowledge of the facts.

Several resolutions of ratification were adopted at the annual meeting of the stockholders of the corporation defendant. They are in my judgment acted upon by the parties participating in the matter with a sufficient knowledge of the facts, and so far as was requisite, with a sufficient knowledge of the law to have given them validity as a bar to this action.

But they lacked what is deemed by the law to be an essential requisite to their efficacy.

No ratification was ever made by the unanimous action of the body of stockholders. Even the large vote which was recorded in favor of the resolutions of ratification is not a reliable evidence of the wishes of stockholders acting at the meeting.

#### Votes by Proxy.

Much of the stock was voted by proxy, and the proxies, as far as appears from the evidence, conveyed no power to vote in the matter of ratification. Again, these proxies, which were collected by the management and in the interest of perpetuating in power the office-holding department of the corporation, were not in all cases evidences of authority, even in the matter of the election of officers, from the actual owners of the stock. The Secretary of the defendant testified that a good deal of the stock that was represented by proxy at these meetings was stock which stood in the names of parties as trustees, who held no beneficial interest in the stock that they authorized to be represented by proxy.

A ratification adopted in that way cannot with any regard for honesty of expression be said to have been adopted by the body of stockholders. Under these authorities I must hold that the resolutions adopted at the stockholders' annual meetings do not constitute any such ratification as would defeat this action. The fact that the stockholders permitted disinterested bank clerks to attend by proxy at stockholders' meetings and vote where they had no interest, might be evidence of laches, but it is not ratification.

#### The Question of Constructive Trust.

As before stated, the matters of trust in question here are matters of constructive trust. As such, they are unquestionably subject to the operation of statutes of limitation. In order to set the statutes in operation, there must be either knowledge of the facts out of which the trust arises or such means of knowledge as the law deems equivalent to knowledge, and declares to be constructive to notice.

Means of knowledge, from which a person of ordinary diligence would have ascertained the actual facts, are deemed such constructive notice as to set the statute of limitations in motion. Section 19 of the "Civil Code" is as follows: "Every person who has actual notice of circumstances sufficient to put a prudent man upon inquiry as to a particular fact, has constructive notice of the fact itself in all cases in which, by prosecuting such inquiry, he might have learned such fact."

It remains now to be seen whether in this case the injured party had knowledge of the character of the transactions involved, or the means of knowledge at such a date as would have allowed the statutory period of limitation to run against the claim before suit was brought.

#### What the Books Show.

In the case of all the transactions except one, enough appeared on the record book to set any reasonable man upon inquiry if he desired to question the sale by the director to the corporation. The minute books of the corporations show that the sales, with the exception mentioned, were made in the interest of J. C. Flood, and that he received the purchase price which was paid for the ground.

#### Exception of the Kinney Transaction.

In the case of all the transactions, except the George W. Kinney transaction, I must hold that the statute of limitations began to run against the company's right to demand as according for the profits on those transactions from the time that the record of the transaction was spread upon the open minute books of the corporation.

Whether the period of limitations be three or four years (a point I do not decide), I consider that all right to recover on any transaction except that with Kinney is barred by the statute. Held that the Minority Stockholders had Actual Notice.

As to some of the transactions I must hold that the minority stockholders, the real party injured, had, if not actual notice, at least the means of informing themselves as to the facts. I have this opinion on what I conceive to be the law, to wit, that the record books of the corporation are notice to the stockholders of the matters therein recited.

It would seem to be the theory of the statute that these books shall serve the purpose of informing the stockholders of the conduct of the corporate business. I know of no reason why the owner of stock in a corporation is exempt from the obligation which the law imposes on everybody, of using the means of information at his hand. The law requires this record book to be kept open for him, and yet it is claimed that he has a right to shut his eyes to his own business and set the statute of limitations at defi-

ance for the purpose of resurrecting a constructive trust.

Whether the period of limitations be three or four years (a point which I do not decide), I consider that all right to recover on any transaction except that with Kinney is barred by the statute.

#### How the Accounting Must be Made.

This accounting must be to the body of stockholders constituting the corporation. If the accounting were to be to the corporation, controlled by a majority adverse to these proceedings, another ratification or release of claims might follow. Inasmuch as the theory of this action is that the stockholders are the real party in interest, and not the adverse managers of the corporation, the Court will direct that the accounting be to the stockholders directly.

#### The Decree of the Court.

Accordingly, all holders of stock at this date will be allowed 60 days after public notice, given by a master appointed by this court, within which to elect to take the benefit of the decree herein, and present their evidence of ownership. The court will provide in its decree that all parties failing to come in within that time shall be foreclosed of all claim against defendants, or either of them, arising out of the transactions considered herein. On the payment of the several amounts that may be determined to be due to parties electing to take the benefit of the decree herein, the defendants will be released from all claims against them arising out of said transactions, either on the part of said corporation or its stockholders.

The measure of the liability of the actual defendants is laid down in Section 2,237, "Civil Code": "A trustee who uses or disposes of the trust property contrary to Section 2,229, may, at the option of the beneficiary, be required to account for all profits so made, or to pay the value of its use; and if he has disposed thereof, to replace it with its fruits, or to account for its proceeds, with interests."

The 1203 shares of stock issued in this transaction became equivalent, by reason of the several increases in the capital stock of the defendant corporation, and the dividends of California stock issued to the stockholders of defendant corporation, to 6,125 shares of the stock of the corporation defendant, and 3,573 shares of the stock of the California Mining Co. Defendants other than the corporation are to account for said shares of stock or their value at this date, and for all dividends paid on said shares of stock as shown by the evidence in the trial, together with interest on such dividends from the dates of payment. Defendants are to be credited with \$3,539, actually paid for the ground, with interest thereon from April 12th, 1872.

SULLIVAN, Judge.

#### Saving Float Gold.

Joseph Wilkins, of Baltimore, Md., has devised an apparatus for saving float gold, which is herewith illustrated. The main feature is to compel the gold to come into contact with the mercury.

A is a pan constructed of any suitable material, from the bottom of which lead pipes, DD, the lower ends of which are secured to a disk, B, having perforations.

In operation, the water to be treated is led into a tank, wherein the sand and heavier particles of dirt and impurities are allowed to subside. The float gold, which is all that its name implies, as it remains suspended for an almost indefinite period, remains in the water, which, when reasonably free from impurities, is led into the pan, A. Previous to this the pan has been newly filled with mercury, the disk, B, which is maintained truly horizontal as shown by a pair of levels, CC, being immersed to the depth of say, three or four inches, whereby an upward pressure of about two pounds to the inch is secured on the lower surface.

The pipes, D, are made of a length to admit of the downward flow of the water—say from 18 to 20 times the mercuric head—the specific gravities of water and mercury being to each other respectively about as 1 to 14.

The water from the pan, A, flows downward through the pipes, D, and out under the disk, B.

Instead of assuming the form of spherical masses and bubbling swiftly to the surface, as it would do were the pipes simply immersed in the mercury without the disk, the water spreads itself into a thin sheet under the disk, whereby every part of it is brought into contact with mercury and any suspended gold, is amalgamated and retained.

The water flowing from the pan F, may be led into the upper pan, A, of a second amalgamator, and thence to a third.

The gold is reclaimed from the mercury by the usual methods. With careful management there is little or no waste of mercury.

The device is simple and inexpensive, being conveniently formed by screwing one end of a piece of gas-pipe into the bottom of a tub and the other into a disk, and immersing the latter in a body of mercury contained in a second tub.

The device requires no care or attention except to remove the saturated mercury and supply fresh, and the use results in a more complete recovery of gold, which has by the process in use heretofore, been wholly lost.

There is nothing new in forcing auriferous material through mercury, a screw conveyor or equivalent mechanism being used to drive the material through a pipe whose lower end is immersed in a mass of mercury, and to such the inventor lays no claim. Moreover, flanged revolving disks immersed in mercury and stationary perforated disks similarly immersed, have been used in recovering gold from auriferous water, but this particular device we have not before seen.

#### Leaching Gold and Silver Ores.

The new work of Mr. C. H. Aaron on the leaching of gold and silver ores, (the Plattner and Kiss process), is a very practical treatise, published by A. J. Leary, of this city. The book was written to supply the want of a plain, practical work on the subject. In the standard works on metallurgy, especially in regard to gold and silver, there is great lack of those details so essential to success.

This condition of affairs Mr. Aaron thinks is due in part to the circumstance that books are less often written by mechanical workers in this branch than by scientific gentlemen who obtain such details as they do give us, not from their own experience, but by inquiry and observation, more or less extensive. It is also in part owing to the fact that in Europe, where most of the books were written there are fewer men who are called on to conduct metallurgical operations without previous apprenticeship to the business.

In the arrangement of the work the author endeavors to make the necessary explanations and practical directions as simple and straightforward as possible, while matter, which, however interesting or instructive, is not essential, appears toward the end, in a separate division. The work is illustrated plainly, but the engravings are new, there being no "padding" with familiar cuts. Mr. Adams' hook is really a very practical and exceedingly useful one. It will be found valuable to anyone interested in leaching or roasting gold and silver ores; and, in fact, to anyone interested in metallurgy. We make the following extract on "Loss in Roasting," to show the style of writing:

The only reliable method of determining the loss of gold or silver in the roasting of ore on the large scale is to dry, weigh, sample and roast a quantity, say from one to ten tons; then after cooling to weigh and sample again. It may weigh more or less than before, according to the character of the ore, the quantity of salt used, and the manner of roasting. The assay of the unroasted ore, coupled with the total weight taken, gives the quantity of precious metal in the lot before roasting and the assay of the roasted ore, with its total weight gives the quantity remaining after roasting. The difference is the loss, caused by dusting and volatilization. To make the test reliable, the furnace must be thoroughly cleaned both before and after the roasting; if this is neglected the weight obtained for the roasted ore will be incorrect.

As a part of the precious metal lost in the roasting may be recovered from the fines and dust chamber, while, besides the losses already discussed, others may occur in the leaching, collecting and melting of the metal, it will be seen that a final result can only be reached by means of a general and complete clean-up; yet, as this cannot be had very frequently, the investigations described are indispensable as guides in working.

It is best when any doubt is entertained as to the best way of roasting a given ore, to experiment in the laboratory on ounce or half ounce samples taken from crushed lots of considerable magnitude. The method employed by some metallurgists, of taking samples from the furnace at intervals during the progress of the roasting, and assaying them with the view of ascertaining the loss at successive stages, is open to the objection that it cannot be known exactly what correction must be made for the changes of weight sustained by the ore. It is however very proper to make such trials, because a heavy loss might be thus indicated in time to alter the treatment of the charge. The percentage of the silver which is soluble must be considered in connection with the loss by volatilization, in order to arrive at the most profitable manner of roasting; for it is better to make rich rather than poor tailings, if the difference should go up the smoke stack.

A. Bateman (brother of Ike Bateman) and Kenny Allen, both large miners of North Diablo and Northern Belle mines, Nev., have bought the Brush Creek quartz mine, near the Mountain House, Sierra Co. and intend to push work vigorously ahead.

## Miners' Wages.

The question of miners' pay is attracting a good deal of attention in Nevada and Utah, and the problem as to whether it would be better for the country if a lower rate of compensation than \$4 per day was instituted, is being discussed pro and con by the press. Those in favor of reduction claim that it would enable companies to employ a greater number of men, work ground that will not pay to work at the present rate of wages and prospect new ground with the possibility of striking bonanzas. These advocates of low wages seem to lose sight of the fact that mining is speculative and fluctuating and that it is impossible to base the rate of wages on the output of the mines.

If wages are small when the mines are not paying, will they be proportionately increased when bonanzas are struck? We think not, as we have yet to hear of the first instance of the kind. It is a well-known fact that the prosperity of a mining camp depends comparatively little on the output of the mines, and if such were not the case, the wages paid miners constitute but a small item in the expense of working mines. The bulk of the cost is embraced in money paid for timbers, powder and other supplies, together (in many cases) with extravagant salaries paid figurehead Superintendents and officers to sit around stoves and tell what they know about mining. We are unalterably in favor of a high rate of compensation, and the employment of none but first-class workmen. Let incompetents and "snides" seek their level.

A good, competent miner, by his superior judgment in breaking ground, taking down and saving ore, the judicious use of supplies and the greater amount of work he can accomplish, can more than save his salary to his employer over the man who does not understand his business. The men who pass a great portion of their lives underground, and have the daily dangers incident to the extraction of the ore, are worthy of ample recompense. The money paid the laborer is spent where it is earned, in the support and education of his family, and proves a benefit to the entire community, while that secured by corporations is taken from the country and finds its way into the great reservoirs of wealth, benefitting the few. Give us high wages and competent workmen in every branch of business, for you may look the world over, and you will find the most prosperous communities where this is the rule.—Owyhee Avalanche.

The coming International Electrical Exposition at Paris promises to be a great success. Among the applications for space has been that of the California Electrical Works of this city.

## Business Directory.

WM. BARTLENO. HENRY KIMBALL

**BARTLING & KIMBALL,**  
BOOKBINDERS,  
Paper Rulers & Blank Book Manufacturers  
505 Clay Street, (southwest corner Sansome),  
SAN FRANCISCO.

**JOHN A. CHURCH, E. M. PH. D.**  
MINING ENGINEER,  
Room 75, 115 Broadway, New York.  
Agent for PADDOCK'S Ore Dressing Machinery.  
Mining Machinery supplied.

**San Francisco Cordage Factory.**  
Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.  
Extra sizes and lengths made to order on short notice.

**TUBBS & CO.,**  
611 and 613 Front Street, San Francisco

## Books for Miners and Millmen.

**KUSTEL'S CONCENTRATION OF ORES** (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arsenurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequalled by any other published embracing the subjects treated. Post-paid, \$7.50. Printed and sold by Dewey & Co., S. F.

**AARON'S TESTING AND WORKING SILVER ORES.**—Illustrated, 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, \$2. Published and sold by Dewey & Co., S. F.

**CORP'S HANDBOOK OF MINING LAWS.**—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, \$1.00. Sold by Dewey & Co., S. F.

A New Edition.

**KUSTEL'S ROASTING OF GOLD AND SILVER ORES** (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. 1880. A valuable and carefully written work. Post-paid, \$3.00. Sold by Dewey & Co., S. F.

## USEFUL BOOKS

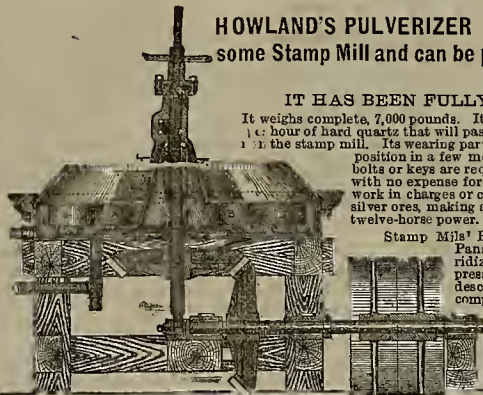

Relating to Casting and Founding, Electricity, Electric Light, Engineering, Drawing, Manufacture of Gas, Heat, Indicator Diagram, Link Motion, Mechanics, Screw Cutting, Slide Valve, Steam Boilers, Steam Engines, Steel, Turning, Wire Gauge, Workshop Receipts. Descriptive Catalogue sent prompt on application.

E. &amp; F. N. Spon, 446 Broome St., N. Y.

## MOREY &amp; SPERRY,

MANUFACTURERS OF

## Gold and Silver Grinding and Amalgamating Machinery

**HOWLAND'S PULVERIZER** Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton of hard quartz that will pass through a 40-mesh screen. The wear is less than the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply. Iron Work complete for Wood Frames, also.

**SPERRY'S**  
WROUGHT IRON FRAME  
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by **DEWEY & CO.,** MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

**Concentration of Ores** (of all kinds), including the Chlorination Process for gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also contains throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

**ROASTING OF GOLD AND SILVER ORES** (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, uplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

## EXCELSIOR BLASTING POWDER

MANUFACTURED BY THE

Excelsior Powder Company.

This is no so-called "safety" Powder, but a powerful explosive, and as safe to handle and use as any nitro-glycerine powder on the continent. There is no headache or nausea in the use of this Powder, as the noxious fumes are entirely done away with. It is put up in cartridges of any size to suit consumers and is exploded with cap and fuse, the same as any other high explosive. The following testimonial is a sample of hundreds of the same tenor being constantly received:

GOLD HILL, August 17, 1880.

**AGENT EXCELSIOR POWDER CO.**—Dear Sir:—I have used your Powder in test cement and hard blasting rock, and find it superior to any Powder in use on the Comstock. It does its work effectually, and does not leave the person using it with a severe headache, like the other Powders do to the majority of miners. In recommending it I would suggest, give it a fair trial and I am confident it will speak for itself. Wishing your Company success,  
I am respectfully yours, etc.,

GEORGE CLARK,

Foreman Sierra G. and S. M. Co.

Address all orders to

**Excelsior Powder Company,**  
Room 40, Merchants' Exchange,  
SAN FRANCISCO, CAL.

## New Book on the Comstock.

The attention of **MINING ENGINEERS** and **EXPERTS** is called to the new work by **JOHN A. CHURCH, E. M. Ph. D.**, on "The Comstock Lode, its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. **DEWEY & CO.**, Publishers of the **MINING AND SCIENTIFIC PRESS**, are sole agents for the sale of the work. **Mr. E. M. SLEATOR** will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

## Metallurgy and Ores.

**WM. D. JOHNSTON,**  
[Formerly Chief Assayer with Thos. Price.]  
**ASSAYER AND ANALYTICAL CHEMIST,**  
118 & 120 Halleck Street,  
Near Laidlaw's, SAN FRANCISCO.  
ASSAYING TAUGHT.

Personal attention insures Correct Returns.

**San Francisco Gold, Silver and Nickel Plating Works,**  
653 and 655 Mission St., bet. New Montgomery and Third, San Francisco.  
Send for Circular. **EDWARD G. DENNISTON, PROPRIETOR.**  
**Awarded First Premium at Every Fair of the Mechanics' Institute**  
**for the Last Twelve Years.**

**HYDRAULIC GRAVEL ELEVATORS,**

For working flat  
gravel mines that  
have no dump.  
Sluices gravel and  
water up hill on an  
angle of 45°, and  
will run any kind of  
gravel that will run  
in a flume. Handles  
rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume  
on 6 inches grade to 12 feet.  
No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the  
process of mining the same as any other hydraulic mine. Is now a practical success in various  
places in California and Oregon. Send for descriptive circular to

**JOSHUA HENDY,**  
No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

**ALEX. DEL MAR,**  
**Mining Engineer,**  
Formerly Director of the Bureau of Statistics of the  
United States; Superintendent of the United States  
Special Commissioners of Mines; Member of the  
Committee on Mines at the Congress of Na-  
tions held in St. Petersburg, Russia;  
Mining Commissioner for the United  
States Monetary Commission;  
author of a History of the  
Precious Metals, etc.  
216 Sansome St., San Francisco.  
Mining properties surveyed and reported upon; assays  
and quantitative analyses made of ores, etc.

**OTTO KAR HOFMANN,**  
(Of the Firm of Hofmann Bros.)  
**Metallurgist and**  
**Mining Engineer.**  
Erection of Leaching and Chlorination Works a specialty.  
Working Tests and Reports made.  
415 MISSION STREET, SAN FRANCISCO.

**F. VON LEICHT,**  
**Mining and Civil Engineer,**  
432 Montgomery Street, San Francisco.  
Reports, Surveys and Plans of Mines made.

**TAYLOR & BRUNTON,**  
**Mining and Mechanical Engineers.**  
DESIGNERS AND BUILDERS OF  
**MILLS AND METALLURGICAL WORKS,**  
FOR THE TREATMENT OF  
Gold, Silver and Copper Ores.  
Mines examined with a view of determining their value,  
and the method of treatment best adapted to their product.  
Will furnish estimates, plans and specifications, and super-  
intend or contract for the erection of all kinds of Mining  
and Milling Machinery.  
Leadville, Colorado, P. O. Box 2639.  
New York Branch Office, 68 Broadway, P. O. Box 203.  
S. F. Agents, Prescott, Scott & Co., 61 First St., P. O. Box 1213.

**J. S. PHILLIPS, M. E., ETC.**  
May still be consulted by old friends, Address No. 1  
Wall Street, New York.

**METALLURGICAL WORKS,**  
**STRONG & CO., 10 Stevenson Street, S. F.**  
ORES SAMPLED, TESTED, ASSAYED.

**SAVE YOUR**  
**GOLD AND SILVER.**  
I am prepared to demonstrate, if miners will bring me  
from 500 pounds to a ton of their ore, that I can save  
from 25 to 100 per cent more than any other machinery  
now in use. I will make no charge.  
Machinery can be seen in operation every day at  
No. 143 Fremont Street.  
**M. B. DODGE.**

**COAL!**  
NOW DISCHARGING.

2,500 TONS Atlantic Cumberland,  
Ex ST. JOHN.  
2,500 TONS Cowpen West Hartley,  
Ex OCEAN KING and WALLACETOWN.  
1,500 TONS Hamilton Scotch Splint,  
Ex DELIANNA.  
1,500 TONS Wallsend Sydney,  
Ex BEEMAH.

For Sale at Lowest Market Rates.  
**J. MACDONOUGH,**  
41 Market Street, S. F.

IMPORTER AND DEALER IN  
**Assayers Materials, Chemicals**  
**AND MILL SUPPLIES.**  
Brass and Steel Wire Screens, Hardware and Fancy  
Goods, Opera, Field and Marine Glasses,  
Optical Instruments, Etc.  
Nos. 521 and 523 MARKET STREET, S. F.

The attention of Assayers, Chemists, Mining and Milling  
Companies is particularly called to the complete stock of  
Balances, Furnaces, Crucibles, Brass and Steel Wire  
Screens, etc., including all the necessities for Assayers  
and Miners, as also for Milling men. An experience of 30  
years in this line of business enables me to guarantee a  
strict attendance to the orders which my friends may en-  
trust to me. Gold and Silver Tables and a full list of ar-  
ticles to be found in my store, to be had on application.

**BOESCH'S PATENT**  
Hydraulic Mining and Locomotive Head Lights, with the  
Latest Improvements, making them the best and  
cheapest in the market.  
**Pacific Lamp and Reflector Factory.**  
569 Mission Street, San Francisco.

Patent Mm and Street Lamps to Burn Coal  
Oil, Naptha and Gas.

**Diamond Drill Co.**  
The undersigned, owners of LESCHOT'S PATENT  
for DIAMOND POINTED DRILLS, now brought to the  
highest state of perfection, are prepared to fill orders  
for the IMPROVED PROSPECTING and TUNNELING  
DRILLS, with or without power, at short notice, and  
at reduced prices. Abundant testimony furnished of  
the great economy and successful working of numerous  
machines in operation in the quartz and gravel mines  
on this coast. Circulars forwarded, and full infor-  
mation given upon application.

**A. J. SEVERANCE & CO.**  
Office, No. 320 Sansome street, Room 58.

**BOILER COVERINGS.**  
Plastic Cement and Hair Felt, with or without the Patent  
"AIR SPACE" Method. Cement ready for use by the barrel.  
**G. C. FOWLER, No. 413 Pacific St., S. F.**

## PATENTS AND INVENTIONS.

### List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

FOR WEEK ENDING MARCH 16th, 1881.

- 233,847.—VELOCIPED SPRING—G. G. Buckland, Tulare, Cal.  
 233,763.—WATER WHEEL—G. J. Collins, Grass Valley, Cal.  
 233,765.—LEMON SQUEEZER—R. H. Daly, S. F.  
 233,864.—WOOL WASHER—J. T. Davis, S. F.  
 233,875.—SAWING MACHINE—G. M. and N. Fay, Eureka, Cal.  
 233,916.—EXPLOSIVE COMPOUND—F. C. Kiel, S. F.  
 233,789.—WINDMILL—F. W. Krogh, S. F.  
 233,918.—BARK MILL—H. Kullman, S. F.  
 233,907.—WINDOW SCREEN—J. Reardon, Ione City, Cal.  
 233,907.—MONUMENT—T. Wagner, S. F.  
 233,818.—CARBURATOR—W. W. Walmsley, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

**SPREADING AND DISTRIBUTING DEVICE FOR THRESHING MACHINES.**—B. Jackson, S. F. This invention relates to certain improvements in devices for spreading and distributing the grain and straw evenly upon the elevator, or feeder, of a threshing machine, and it consists, first, in a means for raising and lowering the rakes while at work; and secondly, in a means for supplying the rakes and frame by brace rods, forcing, with the pitman, a parallel motion from a point near the driving shaft to the side bars, upon which the rakes are journaled so that they may be elevated or depressed, and the rakes maintain their relative position and angle, without the necessity of making an adjustable connecting-rod, or pitman, to the driving crank.

**FEEDER FOR THRESHERS.**—T. S. Bayley Orland, Cal. This device consists in the employment of one or more series of figures of suitable length mounted upon bars placed upon a frame (made vertically adjustable at either or both ends at will) transversely above the carrying belt. It is much superior to rotary pickers, as the teeth of those are liable to wind up the straw and clog, but the oscillating fingers, as they swing back and forward, will distribute the bunches without clogging.

### The Only Establishment.

Should any of our readers of an inquiring turn of mind visit the machine shop of Mr. F. A. Robbins, located at Nos. 5 and 7 First St., they will find what the proprietor declares is the only establishment of its kind on the Pacific coast. This rather high-sounding boast is entirely reconcilable when the following considerations are taken into account.

It often happens that industries of very dissimilar character are, to a great extent, mutually dependent upon each other. A bond of union exists between them which cannot be ignored without detrimental results to all concerned. Leather manufacturers and bootmakers, cloth-dressers and drapers, charcoal burners and iron workers may be cited as familiar examples. The introduction and rapid growth of some novel pursuits not infrequently have the effect to necessitate the founding of entirely new enterprises which thereafter serve as their indispensable adjuncts. Thus, the manufacturing world is, after all, a vast community of co-laborers, severally differing in their individual aims, but all tending to the influx of a common prosperity.

The machine shop of Mr. Robbins, taken in connection with other two prominent industries in this city, is a case exactly in point. His specialty consists in the manufacture of canning and soap making apparatus. Both these industries require a class of machinery, machine implements and tools essentially peculiar to themselves. The wonderful development and growth of the canning business especially has seriously taxed the skill and inventive faculty of machinists and implement makers.

The remark so frequently heard that "every thing now-a-days is done by machinery" is by no means a far-fetched expression, but, on the contrary, in strict accordance with the facts in the case.

Thus it takes machinery to make machinery, and so long as this is true, the demands of the operative will ever be widely in advance of the artisan.

Mr. Robbins founded his establishment in 1876, and by pursuing a policy of strict business integrity, he is now on the high road to competence and prosperity. An accomplished machinist himself, he has the personal oversight of an efficient number of experts in his employ, and as a just return therefor he is accredited with the reputation of turning out a style of work far superior to anything in his line which can be imported from the Eastern States.

Mr. Robbins knows better than censors themselves their every want, and they have but to submit to him their plans and specifications to receive their work in all its varied appointments, as soon as steam-power and skilled labor can fabricate it from the cold, unyielding metal.

The leading canneries and soap factories of this coast constitute his best references, and those persons contemplating the erection of these works need only to visit such establishments while in operation to gain an adequate idea of the superiority and finish of his handiwork.

Like other determined spirits in our city, he is doing much towards checking the importation of foreign and often inferior goods, and is thus largely ministering to the abiding good of our sovereign commonwealth by keeping money at home, where it ought ever to be found, for the promotion of local and domestic improvement.

### Glove Making in San Francisco.

The pioneer manufacturers of this city, in almost every line of industry, had to face a discouraging element quite unknown to the workers of to-day. As in all new countries and cities of unmaturing growth, there was a deep-seated prejudice against whatever was of home manufacture.

Messrs. Shoenberg & Co., of the Pacific Glove Works, established their factory here in 1869, and hence they are among our oldest manufacturers in this calling. Since, in those days, gloves of all grades were known only as one of the products of Eastern manufacture, the prejudice of which we have spoken was one of their great drawbacks. Local skill was brought under the ban of disrepute, and its products, when placed side by side in our markets with Eastern-made goods of no better quality, suffered a corresponding depreciation, and were often the last to leave the shelves of the retail dealer. A silly conceit prompted well-to-do consumers to see a morbid aristocracy in imported goods that was sure to smack loudly of glory and renown. But, thanks to the indomitable energy of our early adventurers in the various industries, such a state of things no longer exists. Old things have passed away, and all things become new. Especially can this change be seen in the glove-making business. So completely have the tables been turned, that San Francisco glove makers are now the acknowledged peers of their Eastern brethren, while New York, Philadelphia and Boston manufacturers are being put to their wit's end to devise means for reviving and keeping alive the ancient fair name of their own home productions. By strict attention to the wants of their customers, Messrs. Shoenberg & Co. have succeeded in amply satisfying jobbers as well as consumers that not only can gloves of all the various grades be made at a less cost here than elsewhere, but, on account of the superior quality of stock and certain processes in manufacture, they are, as a rule, much more durable than imported goods. As a natural consequence, our city jobbers are finding themselves compelled to close up their importing business and rely solely on the substantial home-produced article. But the change does not stop here. Large invoices of gloves made in this city are finding their way into Eastern markets, and although this is suggestive of the old taunt of sending coals to Newcastle, it is one of the realities of the day in which we live.

The Pacific Glove Works give employment to from 50 to 60 hands, mostly women and girls, and none other than white labor is utilized. This fact alone is highly creditable to the proprietors. The whole of the second floor of a building about 100x50 ft. is devoted to the works, and a walk through the various departments during business hours presents to the visitor a scene of well ordered industry. As to the material used, the huckskin is mainly of California production, while the kid and several other kinds of stock are shipped from Europe direct.

About \$50,000 worth of material is annually worked up, and during the same period no less than \$10,000 is paid to employees, thus adding its quota to the great aggregate of home circulation.

One of the specialties manufactured at these works is the "ladies' kid riding gauntlets," an article of peculiar make and nitting qualities which, once seen, are sure to be ever appreciated. Working gloves and the heavier grades are all hand made and sewed with a double waxed thread.

The goods of this firm find their way into all the markets of this coast, the Sandwich islands and, as we have intimated, many cities of the Atlantic States. Large orders are also received from Texas and the southwest border.

Finally, and in conclusion, San Francisco is indebted in no small degree to the glove making industry carried on in her midst, for her increasing reputation abroad as a city of manufactures and commerce.

The Chrysolite Mining Co. is now employing 250 men, and turning out 50 tons of ore daily. There is \$230,000 on hand, but it has been deemed best to defer the renewal of dividends for the present.

### Salt Lake City and the Adams District.

EDITORS PRESS:—Before entering upon the task assigned to me of giving a general and detailed account of late developments and prospects in the various mining districts of Utah, it might not be amiss to say a few words about Salt Lake City, the capital and chief city of the Territory. Zion, as it is commonly called among saints, as well as sinners, is regularly laid out at the foot of the great Wasatch range, only a few miles from the briny lake whose name it takes. The city was founded by the late Brigham Young and his devoted followers, in the year 1847, and now has a population of something over 22,000. It is the largest town between Omaha and Sacramento, and does a thriving business with mining camps, north and south. Among the many handsome edifices in this Rocky mountain metropolis, the Mormon temple and tabernacle are the first to attract a traveler's attention. The former, which it will take two or three years more to complete, is being built of hewed granite from Cottonwood canyon, with walls eight ft. in thickness. The foundation embraces an area of 186x99 ft., and it will have a tower 225 ft. high. The large tabernacle is one of the oddities of the continent, being 250 ft. long by 150 ft. wide, and covered by a dome-shaped roof, which stands 62 ft. above the ground. There is not a single pillar about the structure, and its seating capacity is estimated at 14,000.

The peculiar institution known as Mormonism is not the proper subject for the pages of a mining journal, so that I must forego my desire to refer to it; yet I cannot help agreeing with Artemus Ward when he said that the Mormon religion is somewhat singular, although their wives are plural.

An object of greater interest to a mining man than the religious creed or teachings of a priesthood is the Utah museum of minerals, ores and natural curiosities, which is situated opposite the tabernacle, on South Temple street. It contains a large collection of almost everything found in the mountains, lakes and deserts of Utah, scientifically arranged and labeled in numerous large cabinets. In one of these are shown specimens of the minerals of this region. The quartz specimens are grouped on the west side, where the several forms of silica may be seen in great variety. In the center gold, silver, sulphur and native elements are seen. Rock salt, transparent as glass, gypsum, salt from the Great Salt Lake, etc. Copper and lead from the mines of Utah, with samples of azurite and malachite take up the east side of the cabinet and are specially attractive. In another place may be seen the different varieties of silver and gold-bearing ore from the several mining districts in the Territory. There are the famous Silver Reef ores; silver-bearing sandstones, which are curious and new to science, and ores from the Ontario and other noted mines.

The museum also contains the reptiles and insects of Utah and many such natural wonders as the curious mountain alligator, the horned toads, the mud puppy, or "fish with legs," etc., a rare collection of coins, birds, shells, relics and curiosities relating to the early history of the Latter Day Saints, and antiquities from both hemispheres. Four cabinets are devoted to ethnological exhibits and the Stone Age, while the one set aside for studies in Paleontology, is filled with a rare collection of fossils. In yet another are rare and beautiful specimens of sulphides, calcite and silicates, crystals, petrified moss, etc.

This winter which, with its snowy wreaths, may still be said to linger in the lap of spring, has not been quite as relentless as some of its predecessors. Yet the snow fall has been heavy in some parts of the Territory, and particularly in the Cottonwood canyons. Travel by rail to Alta has been impeded since December, when the shade along the road caved in from snowslides.

In Adams mining district, which is the nearest to this place, being distant about seven miles in a northeasterly direction, very little has been done since last season. The four principal mines known as the Henry, Eureka, Lawrence and General Scott are the property of H. W. Lawrence, Esq., employ from six to ten men, and have proved very profitable to their owner. They lie in the same group, and have been opened through a main tunnel which now extends some 300 ft. Shafts have also been sunk to a depth of from 200 to 300 ft. on a ledge varying from two to four ft. in width. The ore is mostly low-grade galena, carrying from \$12 to \$15 silver to the ton, but at the head of the tunnel assays have been made as high as \$90, showing that a richer body of ore awaits the pick and drill. The formation is principally limestone, with here, as elsewhere, large porphyry dykes crossing the formation. The Blanche and Red Bird are also promising mines in the same district, but I cannot learn what developments are being made in them.

A. L. M.

A NEW and important manufactory has been started at San Leandro, which will materially benefit that burgh as well as Alameda county. It is the San Leandro Plow Co., with a capital stock of \$100,000. The following named gentlemen have been elected Trustees: T. P. Carey, S. Huff, L. C. Morehouse, John F. Stone, Robert Farrelly, F. Meyers and George Smith. The factory will afford employment for 20 mechanics when in operation, which will be in a couple of months.

### The Mechanics' Fair.

The great extension of the railways of the Pacific coast within the past few years and the opening up of new mining and agricultural regions has increased the population of the Pacific coast materially. San Francisco as its business center needs now, more than ever, to show up its industrial enterprises, its manufacturing capabilities and its commercial advantages. Thousands of strangers will visit us this summer, many of them looking for homes on these shores. As a consequence, the industrial fairs of the Mechanics' Institute give to exhibitors an unequalled opportunity of bringing their goods under the notice, direct and personal, of the people of the entire coast.

The Board of Managers now makes public announcement that the Sixteenth Industrial exhibition of the Mechanics' Institute of San Francisco, will open on Tuesday, August 2d, and after continuing four weeks and four days, will close on Saturday, September 3, 1881.

### The Managers offer to

Exhibitors upwards of 175,000 square feet of floor space, where every article useful, rare or beautiful may be advantageously displayed without charge for space. Every facility is given to exhibitors of machinery to show the same in motion, and steam power and water are furnished free when required.

Visitors in search of amusement or instruction will find an immense variety of objects of interest in the Machinery Department and the Art Gallery. This Art Gallery has always been exceedingly popular, the gallery being a spacious, well-lighted apartment, especially adapted to the display of pictures. In the Horticultural Garden will be collections of ferns and rare exotic plants, tastefully arranged, with choice collections of cut flowers and flowers in pots. A special effort will be made this year to worthily exhibit the fruits and wines of California.

A fine band of music will add to the enjoyment of visitors every afternoon and evening. Blank applications for space, a copy of the rules and regulations, and any other desired information will be given on application to the secretary, J. H. Culver, or the superintendent, J. H. Gilmore, 27 Post St. The pavilion will be ready for the reception of goods on Monday, July 22d.

### A Splendid Piece of Gold Plating.

An extensive and magnificent piece of gold plating, the largest ever done in the United States, and probably in the world, has just been completed by the San Francisco Plating Works, 653 and 655 Mission street, E. G. Dennison proprietor. This piece of work consists of a large copper cauldron and cover, of the capacity of 60 gallons. The value of the gold used in making the solution and anodes was upwards of \$4,000, and the value of gold put on the work \$2,500. This piece of work will be used for chemical purposes and is for one of the wealthiest corporations on the Pacific coast. The parties are highly pleased with the manner in which the work was executed. The San Francisco Plating Works have filled a great many orders of the largest description in gold, silver, nickel and copper-plating. These works are among the most extensive in the country. One of the specialties is the manufacture of silver-plated amalgamating plates for saving gold. These plates are extensively used in quartz, gravel and placer mining. The reputation of the plates made here is unequalled, having proved superior to all others. Mr. Dennison will be pleased to receive visitors at any time, to show and explain the process of plating and exhibit samples of work.

### News in Brief.

DAMAGING floods in Nebraska. LARGE fire in Orrville on Monday. EARL BEACONSFIELD is seriously ill. THE trout fishing season opened on the 1st inst.

A NUMBER of Socialists have been expelled from Berlin.

THE old houanza mines are now yielding over 100 tons per day of good milling ore.

COMMODORE SHUFFELDT, U. S. N., has been selected to reorganize the Chinese navy.

THE Fall River, Mass., Weavers and Spinners' Union has decided to pay the men on strike \$6 per week.

THE Treasury officials estimate the reduction of the public debt for March at not less than \$5,000,000.

Coyotes and California lions are killing numbers of sheep in the southern portion of Saa Benito county.

IN England the grand national steeple chase was won by Woolbridge, Regalia second and Thornfield third.

THE Indians are raiding in Tom Green county, Texas, and it is said that considerable damage has been done by them already.

AT Leeds, England, one of the largest flax mills, that of Hives & Tennant, is closed in consequence of depression in trade.

AN excursion is contemplated over the Carson and Colorado railroad on or about the 10th of April, when the ceremony of driving the last spike will be performed.

### Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

### Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolltho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St. S. F.

### Nothing short of Unmistakable Benefits

Conferred upon tens of thousands of sufferers could originate and maintain the reputation which AYER'S SARRA-PARILLA enjoys. It is a compound of the best vegetable alteratives, with the Iodides of Potassium and Iron, and is the most effectual of all remedies for scrofulous, mercurial or blood disorders. Uniformly successful and certain in its remedial effects, it produces rapid and complete cures of Scrofula, Sores, Boils, Humors, Pimples, Eruptions, Skin Diseases and all disorders arising from impurity of the blood. By its invigorating effects it always relieves and often cures Liver Complaints, Female Weaknesses and Irregularities, and is a potent renewer of vitality. For purifying the blood it has no equal. It forces up the system, restores and preserves the health, and imparts vigor and energy. For forty years it has been in extensive use, and is to-day the most available medicine for the suffering sick anywhere.

FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grove, walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

The State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M. to 5 o'clock P. M., daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

### Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

**Lewis Consolidated Silver Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Pioneer Mining District, Pinal County, Arizona. Notice is hereby given, that at a meeting of the Board of Directors, held on the Twenty-third (23) day of March, 1881, an assessment, No. Four (4) of Six (6) Cents per share was levied upon the capital stock of the Corporation, payable immediately, in U. S. Gold Coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Second (2) day of May, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Twenty-third day of May, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. PEW, Sec'y.  
Office, No. 310 Pine Street, Room 15, San Francisco, Cal.

The Undersigned are Agents for, and are Prepared to Furnish Prices and all Particulars for

THE BALDWIN LOCOMOTIVES, every style and for any service.

THE BALDWIN STEAM MOTOR for use on City and Suburban Roads.

FREIGHT CARS, PASSENGER CARS, STREET CARS,

From BILLEMAYER & SMALL CO., and J. M. JONES & CO.

CAR WHEELS, from A. Whitney & Sons.

RAILROAD IRON,

SPIKES, BOLTS, Etc.

FROM BEST EASTERN MAKERS.

WILLIAMS, DIMOND & CO.

202 Market Street, San Francisco

**JOS. A. JOHNSON,**  
SIGN AND HOUSE  
**PAINTER,**  
517 California St., bet. Kearny and Montgomery, S. F.

Prices to suit the times.—Call or send for further information.

## PACIFIC BUSINESS COLLEGE,

320 POST ST., Opposite Union Square, San Francisco.  
Life Scholarship, \$70. Send for Circular.

### "FRUE" ORE CONCENTRATORS.

I have on hand and for sale, at LOW PRICES, a number of the above Concentrators, of the latest pattern and in perfect order.

**JOSHUA HENDY,**

Manufacturer of Quartz and Saw Mill Machinery

AGENT FOR "BAKER'S" ROTARY PRESSURE BLOWERS,

Hot Polished Shafting from the Akron Iron Company, Ohio. Also, "P. Blaisdell & Co.'s" Machinists' Tools. A Large Stock of New and Second hand Machinery at Machine Works.

Nos. 49 and 51 Fremont Street, San Francisco.

### A NEW TREATMENT

—FOR—

Consumption, Asthma, Bronchitis, Dyspepsia, Catarrh, Headache, Neuralgia, Debility, Rheumatism,

And all CHRONIC and NERVOUS DISEASES.

PACKAGE CONVENIENTLY SENT BY EXPRESS, READY FOR USE

### AT HOME.

A Treatise on Compound Oxygen, giving the history of this new discovery, and a large record of most remarkable cures, will be mailed free to all who ask for it. Also, "Health and Life," a quarterly journal, containing much interesting information. Write for it. Address the proprietors, DR. STARKEY & PALEN, 109 and 111 Girard street, Philadelphia, Pa., or H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., from whom can be procured both information and supplies.

J. H. WYTHE, M. D.

Residence: 955 West Street, Oakland. Office: 750 Market St., San Francisco. Before 10 A. M., after 5 P. M. From 11 A. M. to 3 P. M.

### HUNTINGTON'S Oscillating Stamp Mill

It has no Stems, Cams, or Tappets, and Adjusts itself to the Wear of the Shoes and Dies

For Simplicity, Economy, Durability and Effective Working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power.

Price, 900-Pound Hammer, \$500.  
Double Mills, \$950.  
Price, 1200-Pound Hammer, \$600.  
Double Mills, \$1150.

Send for Circulars and Testimonials. SHINGLE MACHINES AND SAW MILL MACHINERY, STEAM ENGINES, ETC., TO ORDER. MINING MACHINERY OF ALL KINDS.

**F. A. HUNTINGTON,**  
220 Fremont Street, San Francisco.

**Engraving** Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco at favorable rates

### INCERSOLL ECLIPSE ROCK DRILLS.

The Most Economical Air Compressor in the Market.

### MINERS' HORSE-POWER.

One Horse can easily hold over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The holding-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX,  
49 Fremont St., S. F.

INDORSED BY THE MOST EMINENT ENGINEERS OF THE COUNTRY AS THE MOST ECONOMICAL AND PERFECT WORKING ENGINE NOW MADE AND THE BEST PIECE OF STEAM MACHINERY THE MECHANICAL INGENUITY OF THE TIMES HAS YET PRODUCED. CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS, RANKIN, BRAYTON & CO., SAN FRANCISCO. SEND FOR CIRCULAR.

## Iron and Machine Works.

### SACRAMENTO BOILER WORKS,

214 & 216 BEALE St. (rear of Etna Foundry),

J. V. HALL,

PRACTICAL BOILER MAKER.

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK, Repairing promptly attended to at the lowest possible terms.

### UNION IRON WORKS,

SACRAMENTO, CAL.

ROOT, NELSON & CO.,

MANUFACTURERS OF

STEAM ENGINES, BOILERS AND ALL

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.

Front Street, Between N and O Streets, SACRAMENTO, CAL.

### Golden State & Miners Iron Works,

Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

### California Brass Foundry,

No. 125 First Street, Opposite Minna, SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE. J. H. WEED. V. KINGWELL.

### California Machine Works,

WM. H. BIRCH, Prop'r.

119 Beale Street, San Francisco.

General Mechanical Engineer and Machinist. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturer of Brodie's Patent Rock Crushers and Steel-Faced Tappits. Agent and Manufacturer of F. A. Youse's Patent Steam Packing Rings for Steam Pistons. The best ever invented; can be applied to any Engine Piston and give entire satisfaction to those using. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

### STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

THOMAS THOMPSON. THORNTON THOMPSON.

## Pacific Iron Works.

Established in 1850.

RANKIN, BRAYTON & CO.

Office—127 First Street, San Francisco, Cal.

Builders of Engines, Boilers, all Classes of Machinery.

PLANTS FOR GOLD AND SILVER MILLS,

Embracing the latest and most improved Machinery and Processes for Base and Free Ores.

WATER JACKET SMELTING FURNACES,

For both Galena and Copper Ores of the Most Improved Construction.

Having Built nearly every successful working Furnace on the Coast, we are prepared to guarantee the best results attainable in all classes of Ores.

HOISTING AND PUMPING MACHINERY,

Embracing all Known Improvements.

WHELOCK'S AUTOMATIC CUT-OFF ENGINE,

Beyond Question the most economical and perfect working Engine now made.

WALKER'S COMPOUND STEAM PUMPS,

The best in use. Will work with thirty per cent. less steam than any other Pump in the market.

Sole Agent for HOWELL'S IMPROVED WHITE FURNACE.

The only successful Chloridizing Furnace made. Over fifty of them in use on this Coast.

Parties Wanting any kind of Mining Machinery are requested to send for Illustrated Circular.

## William Hawkins,

(SUCCESSOR TO HAWKINS & CANTRELL).

MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturer of

IMPROVED PORTABLE HOISTING ENGINES,

FOR MINING AND OTHER PURPOSES.

Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehouse and Public Buildings.

Steam Engines and all Kinds of Mill and Mining Machinery.

L. C. MARSHUTZ

T. G. CANTRELL.

## National Iron Works.

Northwest Cor. Main and Howard Sts., San Francisco.

MANUFACTURERS OF

IMPROVED PORTABLE HOISTING ENGINES.

Stationary and Compound Engines, Quartz Crushing and Amalgamating Machines, Flour, Sugar and Saw Mills.

SOLE MANUFACTURERS OF

Kendall's Patent Quariz Mill, National Ore Feeder & Concentrator.

CASTINGS AND FORGINGS OF EVERY DESCRIPTION.

## Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDGE AND MACHINE BOLTS, LAG SCREWS, NUTS, WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when ad visable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

## \$1,000 CHALLENGE!

## THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of \$1,000 each, and we mean business.

ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

## The De Bay Propeller.

Since the first introduction of the screw propeller, innumerable modifications of the original idea have been made, yet it is admitted that with the propellers in ordinary use, the full efficiency is not utilized. Among mechanical appliances for motive force, none has been more closely studied than this, yet the results of these studies have not been as satisfactory. When the De Bay system, which it is the purpose of this article to describe, was devised, it was so great a departure from custom and theory that few believed any great advantage would result. The system has gradually developed, however, from theory to experiment, from experiment to practice, and now even such an authority as *Iron* is forced to admit that the results of practice, as far as they have gone, stamp the invention as an important practical advance in screw propulsion. This journal, to which we are indebted for our engraving, records the fact, that to-day the theoretical idea of 1876 is found a practical success, with an important gain over the ordinary propeller to its credit. In view of these circumstances, a description and engraving of the De Bay propeller will be of interest to our readers.

The invention dates back no further than 1876. In that year Mr. De Bay took out a patent for a new form of propeller by means of which he designed to obviate the loss of power caused in the action of ordinary screws by the tangential current thrown off by them. This his invention claims to effect by the employment of two screws working in opposite direction, the blades of each screw having portions cut away to permit of the projections on those of the other screw passing through them. Our engraving which represents the propeller as fitted to the s.s. *Cora Maria*, illustrates the manner in which this is effected. The currents set in motion by the one screw are met by those produced by the other, the result being that the whole body of water is thrust directly astern in a line with the axis of the ship. The different motions to be imparted to the two screws must, in all cases where duplicate engines are not provided, necessitate the use of gearing; and against the prejudice that has so strongly prevailed to the employment of such an arrangement on board ship Mr. De Bay has had to struggle for some years. When he first submitted his invention to the notice of leading marine engineers and scientists, he was met not only by the objection to gearing of any description, but also by opposition on the ground taken by most of them, whose views were that the propeller itself was so weak that it would not bear any rough usage, such as it would be sure to meet with in a sea-voyage. He was also told that, granting its immunity from such dangers, it would be almost certain to be fouled by anything floating with which it might come in contact.

There were, however, a few less prejudiced persons who looked upon the invention with more favorable eyes, and in 1878 the company which had been formed for its development resolved upon having a series of trials made with the steam-launch *Eagle*, which was fitted with the propeller, and they entrusted the experiments to Mr. Folkard, M. Inst. C. E. The results reported by that gentleman induced the directors to try further experiments on a larger scale, and a screw collier, the *Elaine*, of about 600 tons burden, was fitted with the De Bay propeller, and made a successful run through rough weather from the north of England to the Thames. On her arrival there, however, it was found that the gearing had been so badly made that it was impossible to continue to drive the propeller with it.

The directors then had a series of trials of models conducted by independent and disinterested experts, in order to test the power of the De Bay propeller against that of the best known form of the ordinary screw. The result of these experiments showed a gain of 40% obtained by comparison with a model of the Griffith screw as fitted to the *Lord Warden*. So encouraging was this result that the steam yacht, *Isolair*, of 40.37 tons and 20-horse power, was hired and fitted with the De Bay propeller and improved gearing. The results of the trials conducted by

Mr. Folkard as the company's consulting engineer showed a superiority over the ordinary screw equivalent to a saving of nearly 30.5% in coal consumption. It was then decided to give the propeller the crucial test of a long ocean voyage in a large ship, and the *Cora Maria* was selected for the purpose. Her length is 235 ft;

parative statement, which we extract from Mr. Folkard's report:—

Four runs over course of 21-fifth miles, two with tide and two against. (Force of wind two to four.) Sea calm. The figures in the first column show the results of a trial made on the 10th of July, 1880, with the ordinary screw;

THE DE BAY PROPELLER.

main breadth, 31 ft, and depth 18 ft. 3 inches. She is fitted with two compound, inverted, direct-action, surface-condensing engines. The cylinders are 23 inches and 54 inches in diameter respectively, with a length of stroke of 3 ft., her power nominal being 110-horse power; her tonnage, net register, is 831 tons; displacement on 18-ft. mean draft, 2,800 tons; her ordinary screw had a diameter of 13 ft. 2½ inches, and a mean pitch of 19 ft. 6 inches; her De Bay propeller has a diameter of 11 ft., and a mean pitch of 18 ft.

A series of trial-runs was made with her at Cardiff last autumn, in order to obtain data as to her speed with the ordinary screw with which she was then fitted. These trials having been concluded, she was fitted with the De Bay propeller, as is illustrated in our engraving. The trials which followed gave very remarkable results, as will be seen from the following com-

and those in the second column the result of a trial made on the 10th of August, 1880, with the De Bay Propeller. Force of wind, three.

Almost immediately after her trials with the De Bay propeller, the *Cora Maria* left for Alexandria and the Danube—Mr. Hiscock accompanying her as the engineer nominated by the company to watch and report on the working of the propeller and gearing during the voyage. The gearing with which she was then fitted, and which had been designed by Mr. Hiscock, failed to give satisfaction—not, however, from defect in design, but from faults arising from too hasty construction.

During the voyage to Alexandria, with 1,700 tons of cargo, thence light to the Danube, and home with a heavy freight of grain, that gentleman reports the propeller never to have caused him any trouble, and the saving of fuel he was able to compute, fully bore out the results obtained at the trials at Cardiff. The form of gearing adopted was considered to have proved itself unreliable; and Mr. Hiscock, on his return, designed a set of mitre-toothed gearing. The under shaft, which is of steel, and carries one of the screws, is a continuation of the main shaft, though of less diameter; and it passes through the hollow shaft of phosphor bronze carrying the other screw. The first-motion wheel is keyed on to the main shaft, and transmits a reverse motion to the third-motion wheel on the hollow shaft through the intermediary or second-motion wheel.

All these wheels, which were of three ft. six inches diameter, were cast of crucible steel; and all their bearings were upon a solid cast bed-plate firmly seated on the frames of the ship.

With this improved gearing the *Cora Maria* was fitted when she returned from her second voyage to Bremerhaven and back, on which the propeller was tested severely by meeting in the northern seas with the most tempestuous weather Captain Cawley, her commander, had ever experienced. Taking on board, at Cardiff, a cargo of coal of over 1,700 tons, the *Cora Maria* left that port for the Thames on the 6th of last month, and met on her journey up channel with the heavy storms which raged on the 7th and 8th of that month. Although considerably injured in her upper works by the force of the sea, the ship made a good run round to the Thames, beating all the steamers which started with her. A few days after her arrival, a large party of engineers and gentlemen connected with the shipping interest were present on board to observe the behavior of the propeller during a run from Gravesend to the Mappin and back. On this occasion the verdict was that there was a total absence of the vibration caused by ordinary screws, no stern wave or wash was perceptible, and the motion more resembled that of a sailing ship than that of a screw-steamer. The vessel's speed, as far as it could be tried in a heavy tideway and shallow water, fully bore out the results of the Cardiff trials.

The report of their consulting engineer has satisfied the directors that the De Bay Propeller Co. that owing to the success of the new gearing they have no further difficulties to overcome. During the trial on the Thames just referred to, although almost new and severely tried by the passage from Cardiff, it worked smoothly and without a sign of heated bearings. The owners of the *Cora Maria* are now so satisfied of the advantages of the De Bay propeller that they are taking steps to have it fitted to other vessels of their fleet. As further experience demonstrates the advantages and reliability of the system, we may expect that an invention which claims to have saved—as in the case of the *Cora Maria*—nearly 50% of fuel (even if that instance should prove to be exceptionally favorable) must sooner or later be widely adopted. The gain to commerce with such conditions will be so apparent to our readers that we need give no figures to illustrate it, and, after running nearly 12,000 miles of ocean journey without the least mishap, Mr. De Bay has fully removed the grounds for the fears expressed as to the weakness of his propeller.

ENDOWMENT OF SCIENTIFIC RESEARCH.—At the recent anniversary meeting of the Royal Astronomical Society of London, in addition to the ordinary business, a resolution was carried by a large majority to the effect that a 'general meeting should be held within two months, to take into consideration the question of the endowment of scientific research, and to express the feeling of the society on the subject.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

San Francisco Mining District, Utah.

The Horn Silver Mine.

EDITORS PRESS:—This district was organized in 1871, but did not become prominent until the discovery of the great Horn Silver mine, in the fall of 1875. This town of Frisco, which contains a population of about 600, is situated at an average altitude of 6,100 ft., among rolling hills which to the west and south assume the dignity of mountains. The town is the present terminus of the Utah Southern R. R. Extension, a broad-gauged road owned by the stockholders in the Union Pacific and Utah Southern railroads and Horn Silver Mining Co. It has two emelters, a number of substantial business houses, one "gospel mill" and nearly 30 gin mills. The Southern hotel, a large and neatly furnished house, built of fire-proof sandstone, is a credit to the Territory. In its management the owner, Mr. J. J. Ferrell, is ably seconded by Capt. J. Pfeiffer, of Snake River placer mining fame. The *Southern Utah Times* is a newsy, wide-awake, 28-column weekly, edited by Mr. Charles S. King, and seems to be well patronized in this and surrounding camps. It is 242 miles by rail to Salt Lake City, and about 32 miles to the Nevada line. The climate is mild in the winter, snow rarely falling to a depth of over one ft., and about as warm in summer as at Rocklin or Sacramento. The one great drawback which Frisco has to combat is a scarcity of water, but it will at the same time offer an excuse for the existence of so many "sample rooms." All the water used by the populace comes in tank cars from Black Rock station 40 miles distant, and is then retailed at three cents per gallon. The price of this indispensable article was seven cents before the railroad brought it within easier reach. The general formation is quartzite and limestone, which is occasionally crossed by large porphyry dykes. I shall not attempt to even mention by name all the mines and locations in this extensive district, as their numbers are too great, but will confine myself to a few of the most prominent among them. First in the list comes Utah's big bouanza, the Horn Silver mine, which was discovered some six years ago by James Ryan and Samuel Hawkes, while working on what is known as the Grampian Hill. They sold their right, title and interest a few months afterward to Allen G. Campbell, Matthew Cullen, Dennis Ryan and A. Byram, for \$25,000, which is a better price than the discoverers of a genuine mine usually receive, but rather small as compared to the \$7,000,000 for which the last-named gentleman a few years later disposed of the same property to its present owners. It is, however, but fair to add that to Mr. Campbell and his associates belongs the credit of having opened up the mine and proving the vein to a depth of nearly 300 ft. They also erected smelting works in Frisco consisting of three stacks, refining works in Chicago, and included in the sale two mill sites and some valuable iron mines.

The original location embraces 1,440 ft. on the lode, 600 ft. wide, and the vein is traceable for two miles, with a general course of north 10° west. The Horn Silver mountain is sedimentary in formation, and has been once the scene of violent volcanic disturbances. Its strata consisted at one time of sandstones and limestones, lying horizontally, which were subsequently transformed into quartzites and marbles raised back from their original position by the volcanic agencies, and now dip to the westward at an angle of 20°. The formation here is limestone and trachyte, which form a contact where the lode occurs. The lode dips to the eastward at an angle of about 70° from the horizontal, and widens out with such a wonderful rapidity that while in one place it is scarcely a foot at the surface it has attained a width of 30 ft. at the same depth. In no place where work is so far being done has the ledge measured less than 28 ft. across, and its average width may safely be estimated at 60 ft., with not a sign of waste rock or wall fragment in the ore deposit. The foot wall consists of layers of quartzites and dolomites, while the hanging wall is a partially decomposed trachyte material.

The ore is divided into two classes, smelting and milling, the former predominating in all parts of the mine thus far open. The smelting ore, which is soft and earthy, consists of sulphate, oxide and carbonate of lead, all carrying silver. The milling ore is of three different classes, which may be designated as clay ore, spar ore and antimony combination. Very few traces of gold have been found in the mines.

The main working shaft is now down about 325 ft., and the company are at present sinking from the second level, which reached the ledge in 195 ft. On the third level it is about 100 ft. from the shaft to the hanging wall. Splendid hoisting works have been erected and railroad cars are loaded direct from the bins. The whole is under the able and efficient management of Major H. C. Hill, while Mr. George Hall superintends the mine.

The company are at present erecting new smelters in the neighborhood of Salt Lake City, to which the bulk of the ore taken from this mine will soon be shipped.

In my next letter I shall refer to some of the other mines in this district. A. L. M.

The National Balance Sheet.

The following is an official statement showing the financial and economic transactions of the United States of America for the four years ended March 1, 1881:

	March 1, 1878.	March 1, 1879.	March 1, 1880.	March 1, 1881.	Total.
Total receipts.....	\$265,839,831.85	\$297,038,817.04	\$298,749,742.85	\$360,580,175.41	\$1,223,207,566.15
Total disbursements.....	218,289,331.58	256,094,982.11	250,472,427.63	287,282,427.63	\$1,012,159,269.95
Total debt, less cash in the Treasury.....	2,042,697,120.08	2,020,207,641.66	1,905,112,221.17	1,570,556,412.77	\$6,538,567,405.68
Decrease of debt.....	46,744,013.06	14,829,687.42	31,045,380.49	76,816,588.42	\$168,015,679.39
Annual interest charge.....	92,637,283.50	101,615,647.50	130,211,033.00	176,083,252.50	\$400,547,116.50
Available in the Treasury, including redemption fund.....	72,920,913.88	144,635,043.00	160,331,700.30	176,083,252.50	\$453,970,909.68
Available in the Treasury, exclusive of redemption fund.....	12,768,565.96	38,205,559.52	62,076,111.57	83,108,925.08	\$196,160,162.13
Available in the Treasury, exclusive of redemption fund.....	30,999,399.00	36,211,600.83	62,076,111.57	83,108,925.08	\$196,160,162.13
Exports of live stock.....	209,762,809.00	326,762,690.00	374,636,312.00	915,271,163.00	\$1,826,432,974.00
Exports of other food.....	47,103,265.00	29,304,143.00	23,022,973.00	16,028,388.00	\$115,458,829.00
Exports of merchandise.....	47,103,265.00	29,304,143.00	23,022,973.00	16,028,388.00	\$115,458,829.00
Total exports—merchandise.....	94,206,530.00	58,608,336.00	55,045,946.00	32,056,771.00	\$239,917,183.00
Total imports—merchandise.....	25,200,000.00	56,990,250.00	92,714,283.00	88,570,187.00	\$263,475,710.00
Production of specie.....	1,488,423.00	911,212,265.00	5,073,831.00	5,701,252.00	\$7,175,771.00
Production of gold.....	300,000,000.00	421,000,000.00	222,000,000.00	264,000,000.00	\$1,207,000,000.00
Production of silver.....	300,000,000.00	421,000,000.00	222,000,000.00	264,000,000.00	\$1,207,000,000.00
Production of wheat.....	1,383,218,750.00	1,545,706,650.00	1,545,706,650.00	1,545,706,650.00	\$5,020,338,650.00
Production of corn.....	1,383,218,750.00	1,545,706,650.00	1,545,706,650.00	1,545,706,650.00	\$5,020,338,650.00
Production of pig-iron.....	1,383,218,750.00	1,545,706,650.00	1,545,706,650.00	1,545,706,650.00	\$5,020,338,650.00
Production of coal.....	54,308,590.00	52,130,534.00	65,303,208.00	69,200,534.00	\$241,442,866.00

NOTE.—The debt, less cash in the Treasury March 1, 1877, was \$2,088,781,143.04, and the annual interest charge, \$94,403,645.50; showing a decrease in the debt during the four years, as above, of \$208,824,730.27, and of the annual interest charge, \$17,557,708.

JOHN SHERMAN, Sec'y.

Treasury Department, March 1, 1881.

Treatment of Pyrites.

A discovery, which if successfully developed is likely to effect nothing short of a revolution in the pyrites trade of this country, has recently been made, and is presently seriously engaging the attention of chemists both in England and on the continent. Concerning it the *London Mining Journal* says: It has long been acknowledged by competent authorities that the method now followed for the assaying of pyrites was not the most satisfactory that could be wished; but the difficulty hitherto experienced in dealing with that ore was to extract the various metals (gold, silver and copper) in a manner that would yield a profit on the operation. This is the difficulty now said to have been overcome, and the discoverer of the process is a French scientist of standing. Of course, the practical results in dealing with large quantities of ore are yet to be ascertained, but the experiments up to this time made show a return of between 1 to 3 of an ounce of gold from each ton of pyrites treated. The right to the patent has been secured by the Tharsis Sulphur and Copper Co. (limited), and the apparatus necessary for the proper working of it out is being erected at the works of the company. The experiments hitherto made have been conducted in Paris, and there the results are regarded as of satisfactory character.

The company last year dealt with between 300,000 and 400,000 tons of pyrites, and the calculation is that the value of the gold extracted by the new process represents at least £3 per ton; off that sum, of course, there will fall to be deducted very heavy royalties.

FREIGHTS TO NEW MEXICO.—The rates of freight between Deming, N. M., to San Francisco and St. Louis having lately been the subject of newspaper correspondence, J. C. Stubbs, general freight agent of the Central Pacific railroad company, furnishes the following: The freight rates from San Francisco are as follows: To Tucson, from \$2.05 to \$3.50 per 100 lbs., according to the class; to Deming, from \$2.05 to \$4.50 per 100 lbs., according to class. From Los Angeles the rates are: To Tucson, from \$1.90 to \$2.75 per 100 lbs., according to class; to Deming, from \$1.90 to \$3.75 per 100 lbs., according to class. The rates from St. Louis are as follows: To Deming, from \$2.45 to \$5.35 per 100 lb., according to class; to Tucson, from \$4.02 to \$6.92 per 100 lb., according to class.

The Dull Spell at Globe.

A correspondent of the *Globe* (Arizona) *Chronicle*, gives the following "plain facts" to that paper, and the remarks will apply to other camps as well as that: I beg leave to make a few pertinent remarks and suggestions in regard to the present "dull spell" in Globe district, and state my ideas as to the best plan for restoring our late prosperity. The evident causes of our dull times are two-fold: First, most of our good mines have fallen into the hands of San Francisco and Eastern capitalists, who can afford to wait (and are calmly waiting) for opportunities to make quick and large fortunes by speculation, instead of developing their properties, or even attempting to do any actual or legitimate mining; second, a large majority of our "miners" who still own good claims in Globe district, are not attempting to make actual mining their legitimate vocation, but are simply trying to get their mines in the most attractive shape so as to sell as quickly as possible. Now, we do not question the right of both capitalists and miners to do as they please, but this mistaken policy is certainly pushing the camp down to a "bed-rock" condition. But there is no use in wraogling over the causes of this unfortunate state of affairs. I came to Globe to stay with it, but I "didn't come for my health!" I came with a small fortune, with a desire to increase it, but life is short, and I don't think it reasonable to wait till all the good mines elsewhere are worked out, before Globe district can get a chance. Now for the remedy: My proposition is simply to put our shoulders to the wheel jointly—miners, merchants and millmen—and push Globe ahead. I, for one, am willing to stake part of my means for the advancement of our common prosperity. Let there be one or more companies formed to work mines and take out bullion. Let miners, millmen and merchants be equally interested in the bullion produced. Let the miners furnish the mines and muscle, the merchants the grub and supplies, and the millmen work the ores. This is a feasible enterprise, as we yet have lots of mines not in the hands of speculators. We must show confidence in our own mines and work them, if we would have others believe in them. I sincerely hope that my suggestions will result in something practicable that will revive business at an early day in Globe city and district.

Mining Debris.

In the case of L. L. Robinson against the Black Diamond Coal Co., the Supreme Court has affirmed the ruling in favor of the defendant. The decision in this case has been awaited by many with a considerable degree of interest and anxiety, as the principles involved bore an affinity to those in the debris case. The facts of the case under consideration are briefly as follows: Robinson was the owner of a tract of land on the San Joaquin river, and the company had been mining for coal some three miles distant from this land, at an elevation of 700 to 800 ft. above Robinson's land, and had been so engaged for many years before the commencement of this action. Adjacent to the company's mine was Guercus creek, which extended from the mine, in a deep gulch, to the lowlands, where the watery cargo was discharged, Robinson's land being flooded thereby. According to the evidence in the case, the company deposited in the creek, at or near the mine, coal screenings, ashes and other substances, which during the rainy season were carried and distributed by the waters in the creek upon Robinson's land, and the value of the land was thereby greatly depreciated. In rendering its decision, the Supreme Court held that it would not be claimed that the company could convey and deposit refuse matter from its mine upon Robinson's land by means of carts, without incurring liability for any damage suffered by him by reason thereof, and the court knew of no principle upon which it could be held that a person may escape liability by doing that indirectly which would render him liable if done directly.

The Boss Bullion Shipment.

In answer to a query as to the large weekly yield of the Bonanza mines, the *Gold Hill News* says:

There were, during the years 1876 and 1877, several bullion shipments from the Bonanza mines which excited the wonder and admiration of the world. It would take time to look over the lists of these shipments for the largest amount turned out in any one week by a single mine. Your question can be answered, moreover, without it.

The biggest bullion shipment ever made at one time from the Comstock was by the Bonanza mines for the week ending Dec. 29, 1877. It was as follows:

Con. Virginia shipped at that date 133 bars of bullion weighing 16,668 lbs., and valued at \$540,196.05.

The California shipped 129 bars, weighing 16,130 lbs., and valued at \$559,903.66.

Summary—Dec. 29, 1877, bullion shipment from the Bonanza mines: 262 bars of bullion (16 tons, 818 lbs.), valued at \$1,099,099.71.

This was one shipment and made for that week, but really included eight days' run of the mills. It was loaded on flat-cars like pig iron and sent on the Virginia & Truckee railroad without any special guard.

The Paradise Mines.

According to reports from authentic sources, there is a mining revival in Mount Rose district, which is generally known as the Paradise mines. In the old claims which are being worked, extensive bodies of good ore have been developed, and in many of the new locations, or rather old claims which were neglected until quite recently, important developments are being made. When first discovered a few years ago, the Paradise mines created quite a stir among mining men. Unfortunately, the Paradise Valley, which was then considered the representative mine of the district, fell into bad hands, which, from bad management or some other cause, did not sustain its reputation. The surface ores of the mine were brought here by freight teams and shipped by rail to the Rye Patch mill, where they produced about \$175,000. Subsequently the company built a mill, and the proposition, based on the statements of the officers of the company, was that the mine was paying a handsome profit. Meantime, for some unknown cause, the stock depreciated to a few cents a share, so that the value of the mine and mill, according to the Stock Board quotations, was not over seven or eight thousand dollars. Work was suspended on the mine last fall, and it has remained idle ever since. This was a severe blow to the district, particularly as outsiders did not understand that the mine had not been prospected below the point where water was encountered. But the mine owners, who were aware of this fact, were not at all discouraged by the suspension of work on the Paradise Valley, but kept on at work, and now their perseverance is rewarded by rich strikes in almost every claim which is at all prospected. Experienced mining men say the geology of Mount Rose district is similar to that of the Comstock, and there is no longer any good reason to doubt the existence of extensive ore bodies in the mines. To-day there is more ore in sight in the district than ever before, and undoubtedly more work will be done there this summer than any previous time since its discovery.

American Trade with Mexico.

Tucson, which has been the market to supply the State of Sonora with all and every class of goods and merchandise will, of course, continue to do the same and on a much larger scale than heretofore, provided they will not kill the goose with the golden eggs. The principal complaint of all business in Mexico against American houses is that very mistake, and accounts for the strong hold of European houses all over Mexico, Central and South America. Various instances have occurred that Mexican merchants have gone to New York and made large purchases for cash, and after their return they saw by the next steamer the arrival of an agent sent by the very house from whom they had bought their goods, bringing with him another shipment of the same goods, with the intention to sell them and to compete with them before their own shop, selling the goods at auction or at whatever price they would fetch. This sort of proceedings of houses, which in New York are considered to be of first-class standing, is to say the least, against all ideas of common decency.

The only line of conduct of our merchants, if Tucson wishes to keep and increase the trade with Sonora, a trade which, after the completion of the railroad to Guaymas, might easily be extended down the coast to Mazatlan, San Blas, Acapulco, and Guadalupe, must be the strict observation of decency and honesty in their dealings with those customers, and if they will keep this before their eyes, we have not the slightest doubt that this city will, in another decade, be the large business center of this part of the United States.—*Arizona Mining Journal*.

LONGITUDE OF THE ASIATIC COAST OF THE PACIFIC.—It is understood that Lieutenant Commanders F. M. Green and C. H. Davis, Lieutenants S. M. Ackley and John Morris, and Surgeon Dale, U. S. N., now in San Francisco, have been detailed by the Navy Department to determine the correct longitude of the Asiatic coast of the Pacific ocean. They sail Saturday for China, to join the *Palos* on the Asiatic station. All points on the coast of Japan and China, connected by cable, will be visited, and their exact longitude determined. The American officers have permission from the cable companies to establish stations and use the wires at night. English officers are engaged in a similar work in New Zealand and Australia. The information obtained from the observations will be exchanged by the two nations. English officers have determined the longitude as far as Madras and Russian officers have made observations on the Siberian coast. All observations have been taken from the Hongkong observatory. The American party will ascertain the precise longitude of that place, there being a question as to the accuracy of the standard. The object of this movement by the Navy Department is to establish correct standards, from which true charts for the protection of maritime interests may be produced.

OSCEOLA.—A letter has been received here from Osceola in which the writer says: Times are very dull here at present, but I think there will be some very good mines on Weaver creek, and some say that they will pay \$20 a day with a good head of water. The bar prospects better than the creek claims.

## MECHANICAL PROGRESS.

## Foaming.

Foaming or priming means that the water in the boiler is in a state of violent agitation, rising and falling rapidly in the form of waves, or that the steam is mixed with water in the form of spray. Foaming is a source of great inconvenience, and not unfrequently of danger, on account of the uncertain and wrong indications of the water level given by the gauges; and as water is carried with the steam into the cylinders, it causes a serious loss of efficiency, and may cause a breaking down of the engines.

Foaming is made evident by the boiling up of the rapid and irregular oscillations of the water in the gauge glass, and by the sputtering sound produced as the mixture of steam and water issues from the gauge cocks. When the water is carried over into the cylinders its presence is made known by a clinking noise caused by the partial collapse of the piston rings, and, when the water is present in large quantities, by the thumping of the piston at each end of the stroke. All boilers are apt to foam when the water contains much mud or dirt of a mucilaginous nature. Soda, introduced into the boiler to neutralize the fatty acids contained in the feed water, often produces foaming. The various organic substances introduced into boilers to prevent the formation of scale are apt to produce the same effect.

The engines of the English naval vessel *Hecate* were broken down by excessive foaming, caused by the lime placed in her boilers to preserve them and not removed before getting up steam. When a vessel coming from the sea enters fresh water, or from a river enters the sea, the boilers foam frequently. In such cases it is advisable to change the water in the boiler as rapidly as possible by opening the surface blow valves wide and putting on strong speed.

The plan of stopping foaming by covering the surfaces of the water in the boiler with a layer of oil or molten tallow injected through the feed pumps is not to be recommended. It is not only an expensive remedy, but the decomposition of the animal or vegetable fats at high temperatures, and in contact with metals, produces fatty acids which are very destructive to boilers. Boilers are liable to foam when they have an insufficient and low steam room, a contracted water surface, and such an arrangement of the internal parts as to render the circulation of the water defective. It may be assumed that any boiler will foam more or less when its evaporation exceeds a certain limit, so that the steam bubbles rise so rapidly as to carry some of the water through which they pass along with them. For this reason, some water tube boilers are provided with deflecting plates at the upper end of the tubes, without which the water would be thrown in jets from the tubes into the steam space.

When the steam, as it is generated, has to escape in large masses through very narrow water passages, separate channels must be provided for the descending water currents, else the meeting of the two currents moving in opposite directions is very apt to result in foaming, or, sometimes, in lifting the water. The latter expression means that the steam does not rise as it is generated through the overlying mass of water, but accumulates on the heating surfaces so that water appears at a greater height in the boiler than would be the case if the steam and water occupied their natural positions.—*Ec.*

**A NEW STEAM PRESSURE REGULATOR.**—We learn from *Nature* that M. Weisnegg has lately constructed for M. d'Arsonval a new steam-pressure regulator which deserves notice. It fulfills, according to the inventor, the following conditions: 1. It maintains a perfectly constant pressure of steam in a boiler, whatever the actual output. 2. It maintains the consumption of fuel at a rate proportional to the output of steam. 3. It is absolutely automatic, and, therefore, prevents all risks of explosion. This regulator is of very simple construction. A leaden pipe from the boiler leads to a little apparatus somewhat resembling an ordinary lever safety-valve, but in which the valve-plug, instead of fitting into the usual conical seat, rests upon a thin disc of India rubber. This disc rises when the pressure from below exceeds the downward pressure from the plug and the superincumbent lever, and of the weight which it carries. It cannot get hot, as it is far from the boiler, and the space below the disc is filled with water condensed from the steam. The upper surface of the valve-plug regulates by its movement the flow of gas, which comes in and goes out by two pipes leading to the upper part of the regulator. One of these comes from the gas mains, the other goes out to the burners under the boiler. By this arrangement, whenever the pressure in the boiler reaches any desired maximum, the apparatus itself reduces the supply and turns down the flame, thus maintaining the pressure constant and the consumption proportional to the output of vapor. It will be seen that the invention is only applicable to the case where the fuel employed is gas. The apparatus is also in itself an automatic safety-valve, putting out the fire when the pressure exceeds the limit. M. Weisnegg has had practical experience during three years of the working of the new regulator, which appears to leave nothing to be desired in its performance. The same gentleman has constructed a constant-pressure air blast on the same principle.

## High-Speed Engines.

Within the last few years high-speed engines have gained a well-merited favor with rolling mill managers and others for economy and efficiency, and it appears to be only a question of time and of adaptation to circumstances when the field of the high-speed engine will be largely extended. One of the applications to which it will probably be put at an early date is the blowing engine. Attention is being more generally directed to greater economy in producing the blast for our furnaces and Bessemer works, and it seems likely that improvement will be sought in the direction of using a greater speed in the engines. The economy of high speed has been repeatedly demonstrated, and it is now generally recognized that, in connection with heavy reciprocating parts, it affords valuable advantages.

The *Iron Age* of March 10th gives an illustrated description of a high-speed engine recently built at the Hlewes & Philips Iron Works, Newark, N. J. A special feature of the engine is the form of the bed, which has been especially designed with a view of securing compactness and rigidity. The valves are given a quick opening movement, the steam passages are short and direct, and the exit of steam is effected with but little back pressure. The main bearing is also made one of the new features of the engine. The engine has a piston speed of 600 ft. per minute, the number of revolutions varying according to the size of the engine from 75 to 260.

**STEEL POLISHING.**—The following is taken from Holtzspffel: The polishers for razors and fine cutlery are soft leather wheels, charged with crocus, which are always used dry. It is necessary that both the polisher and the blade should be hot, as without a moderate and equal degree of heat, short, however, of that producing a color on the steel, the process does not succeed, a good polish is not produced. It is therefore usual with some workmen, before commencing work, to take a piece of razor steel which is held against the revolving polisher, to prepare it for the work itself, by crushing and regulating the powder with which the polisher is charged. A very moderate speed only is necessary for the polisher, but the razor is moved to and fro from end to end very quickly, and with considerable pressure, to distribute the heat equally. In examining the work the polished part is occasionally wiped clean with the "patch," a thick piece of cloth or felt, which is used both to protect the fingers from the heat of the blade and also to supply the polisher with crocus, as the patch is dabbed upon a small quantity of dry crocus close at hand, and then rubbed upon the polisher to transfer the powder to the wheel. If the polisher becomes hard on the surface, from being scorched, the wheel is stopped and the face of the polisher is roughed up or thoroughly scraped with an old razor blade or knife as in erasing writing, in order to remove all the old head or polishing stuff, and render the leather a little rough and quite soft; after which it is recharged by means of the thumb or patch.

**WIRE ROPE TRANSMISSION.**—Among the recent improvements in the way of transmitting power for long distances, is the substitution of belts by endless wire ropes running at a high speed. Just where the belt becomes too long for economy there the rope steps in. In place of a flat-faced pulley a narrow sheave, with a deep, flaring groove, is used, the groove being filled out, or lined rather with leather, oakum, India rubber, or some other soft substance, to save the rope. The essential points are a large sheave, running at a considerable velocity, and a light rope. When the distance exceeds 400 ft., a double-grooved wheel is used, and a second endless rope transmits the power 400 ft. further, and so on. The loss by friction is said to be only 8% per mile. If it is required to transmit 300 horse power by means of a wire rope, the size of rope required will be one inch in diameter, running 4,920 ft. per minute over a wheel 14½ ft. in diameter, making 108 revolutions per minute. One is thus enabled, at a small expense, to transmit power in any direction.

**THAT WONDERFUL LOCOMOTIVE**, built at Paterson, N. J., for an inventor, who, in his design, turned the ordinary locomotive topsy-turvy and imparted power to the driving wheels by friction, has been tried, and is said to have given remarkably good results in drawing heavy loads up grade, but it has not been tested for speed. On an up-grade of about 12½ ft. to the mile, the engine pulled 21 cars weighing over 474 tons with such an ease that more cars were added to the train in successive experiments, until finally 39 loaded cars, weighing 862 tons, were pulled over the same grade with from 135 lbs. to 140 lbs. of steam. In this engine the cylinder and the moving parts are above the boiler, so as to permit the use of double drivers, one set above the other, so proportioned as to give great speed to the driver, resting on the track, and to which power is imparted by friction.

**PROGRESSIVE INSTINCT(?)**—A singular circumstance is reported from a hot, dry valley in New South Wales. Last year the drouth there was of long duration, and the denizens of the apiaries suffered much from it. This year the bees have made provision against a similar emergency. They have filled a large number of the external cells in every hive with pure water instead of honey. It is thought that the instinct of the creatures leads them to anticipate a hot summer.

## SCIENTIFIC PROGRESS.

## Progress in Chemical Science.

It is very interesting and instructive to observe the steadily onward progress of science, and to note how, in the process of evolution, ideas and theories follow each other; each in turn ruling its particular department, accepted for the time as the perfect truth, yet to be superseded and apparently condemned. But the most interesting lesson to be derived from such a review is that *truth* never dies; it only changes its form. Scientific progress is not a series of revolutions, but a continuous evolution. This is, in fact, the fundamental distinction between true science and the pseudo-science of the paradoxists. With the latter each imaginary discoverer of the laws and secrets of nature is an independent prophet; his doctrine springs perfect from his own brain like Minerva from that of Jupiter. In true science each new discoverer of natural laws builds upon the foundations laid by that of his predecessors, and employs the material gathered by their labors. The superstructure may be altered in form, or even applied to new purposes, but the building is yet ours; the work of its successive architects remains.

In chemistry especially such apparent transformations imposed upon a true unity are very common, and the last 20 years have witnessed what appears to be an entire revolution in the chemical theories; but the changes are, after all, only modified and more complete expressions of old thoughts. During the last century, however, there has been a very complete and fundamental change in the science, yet that change, apparently entire, is destined to be but a step in progression; in the abandoned theories there was embodied a truth, and that truth, slowly growing like a germinating seed, is gradually penetrating the new theories, and combining together the old and the new into a more perfect unity.

For a century Stahl's theory of Phlogiston ruled chemistry. That theory asserted that combustion (and in consequence chemical combination generally) was due to an agent, or element, which united to matter, such as oxides, and so generated combustible substances; such substances, as we now know, being, in fact, simpler or elementary bodies; the act of combustion was the release of "phlogiston." Here we find fully exemplified that mixture of truth and error which is so commonly the result of the determination to explain facts, while the knowledge of the facts themselves is imperfect, and the processes occurring are unstudied. Phlogiston is but one of the long series of "fluids" invented by philosophers who would not wait, who thought that by covering up obscure facts in a word they could make that word explain the facts. We do the same still with the word which embodies the last of these fluids which survives, "electricity." Few recognize the certain fact that "electricity" is only a word, and a word which really only einhohiss facts and processes—not their cause.

Lavoisier made manifest the weak point of this theory by showing that combustion was a process involving absorption and increase of weight, and, therefore, could not be explained by a supposed loss of substance. This, followed by the discovery of oxygen and the development of the atomic theory, utterly banished phlogiston from the domain of science and left it a mere subject of ridicule. From that time chemistry became purely a material science, and devoted itself solely to the changes of position and union among the material particles or atoms, and working up through the successive theories of radicals, types, symbolic notations and molecular constructions, we have arrived at means of presenting to the imagination, and almost to the eye, a clear view of the infinitesimal arrangements of the elementary atoms which constitute the infinite variety of actual substances.

But, after all, valuable as these formulae and typical constructions really are, and important as is the part they play both in scientific advance and in the practical application of chemistry, yet they are to real chemistry, to the truth of nature, only what stuffed and dried specimens and articulated skeletons are to natural history. The life is absent, the causes operating are ignored.

The above is in part an introductory by J. T. Sprague, to his notice of the recent elaborate work of the great French chemist Berthelot, entitled "*Essai de Mécanique Chimique fondée sur la Thermo-Chimie*." This work consists of 1,340 pages, in two volumes, and is well calculated to give a great and new impetus to the study of chemistry. M. Berthelot says, in his closing summary: "The view of the chemical actions of substances, taken in their several conditions as gaseous, liquid, solid and in solution, has thus been presented in a general outline, and reduced to one single law of chemical statics. This law not only furnishes ideas both new and fruitful, both in theory and in practical application, but the very face of chemistry and the mode of its teachings are changed by it. "Such is the destiny of all human knowledge. No theory is final. The foundations of our knowledge undergo transformations, and the point of view is continually altered by an ever advancing process of evolution.

"The chemistry of types, of eeries, and of symbolic construction which has hitherto con-

stituted nearly the whole of the science, will hereafter be found, if not set aside (for no true science can thus disappear), at all events relegated to the second rank by the chemistry of the forces and their mechanics; this will control the former, because it will furnish the laws and the measures of its actions.

"The varied forms of matter, of which chemistry studies the diversity, are but parts of a common mechanism, the laws of which are the same when acting in the ultimate molecules of crystals, as those which control the visible parts of ordinary machines. From the mechanical (or physical) point of view, two fundamental ideas characterize the apparently infinite diversity of chemical substances, namely, the mass of the elementary particles—that is, their equivalent—and the nature of their motions. The knowledge of these two ought to explain everything. To this is due the present, and the yet greater future importance of thermo-chemistry, the science which measures the work of the forces operating in molecular actions."

**INCREASE OF RISK FROM LIGHTNING.**—The progress of civilization brings with it ever growing dangers. Herr Von Bezold inferred already in 1869, from observations taken in Bavaria, that there was an increase from year to year in the number of buildings struck by lightning. There seemed to be also an increase in the number of thunderstorms, and this was assigned as the cause. A little later, observations (by others) in Saxony and Schleswig-Holstein also showed an increase in the number of houses struck, but no comparison was made with the number of thunderstorms. Herr Holtz has lately made a fuller inquiry on the basis of data from all parts of Germany, and from Austria and Switzerland. In his brochure on the subject he publishes two tables, one to show the increase or decrease of thunderstorms since 1854, since 1862, and since 1870 in the different regions; the other the increase or decrease of lightning risk estimated from comparison of the number of lightning strokes on houses with the entire number of houses. It appears, then, that, while any increase in the number of thunderstorms is extremely small, and there is in some cases even a decrease, the lightning risk shows a very large increase, and in no case a decrease. Thus the increase of risks from lightning must be regarded as not due, unless in very slight measure, to meteorological influences. This appears more distinctly in that the increase of lightning risk is proportionally greater as the compared years are further apart; but it is not so with the increase of thunderstorms (which, *c. g.*, is less since 1854 than 1862). To explain the increased risk by telluric changes, Herr Holtz supposes the clearance of forest land has to do with it, perhaps, also, the increase of railways, both of these bringing thunderstorms more to towns and villages. Another probable cause is the increased use of metal in house construction.

**ANTARCTIC EXPLORATION.**—While the energy of modern explorers has greatly extended our knowledge of the geography of the North Polar regions, comparatively little has been done in the exploration of the corresponding portions of the southern hemisphere. Lieut. Wilkes, at the head of an American expedition, believed that he had established the existence of an Antarctic continent, and this discovery was verified a year later by Sir James Ross, who found the extensive Victoria Land with mountains 14,000 ft. high, and an active volcano. Beyond these discoveries, nothing is positively known of these extensive regions of the earth. It is now proposed by the Italian Geographical Society to send out an Antarctic exploring expedition under the command of Lieut. Beve, an Italian officer, who accompanied Prof. Nordenskjöld in his recent Polar voyage. The expedition of Lieut. Beve, it is given out, will be fitted out for a prolonged voyage, and it is announced to be the intention of the voyagers to winter in the Antarctic region for the purpose of making a thorough study of its character.

**THE PRACTICAL VALUE OF SCIENCE.**—I have endeavored to state the higher and more abstract arguments by which the study of physical science may be shown to be indispensable to the complete training of the human mind, but I do not wish it to be supposed that because I may be devoted to more or less abstract and unpractical pursuits I am insensible to the weight which ought to be attached to that which has been said to be the English conception of Paradise—namely, "getting on." Now the value of a knowledge of physical science as a means of getting on is indubitable. There are hardly any of our trades, except the merely huckstering ones, in which some knowledge of science may not be directly profitable to the pursuer of that occupation. An industry attains higher stages of its development as its process become more complicated and refined, and the sciences are dragged in, by one by one, to take their share in the fray.—*Huxley.*

**THE GAIN IN WEIGHT BY COMBUSTION** can be very prettily shown by the following method, which also affords a very good lecture experiment. A handful of fine zinc turnings is placed on the scale pan of a common balance, which should then be brought into equilibrium by placing weights on the other scale pan. Now apply a spirit lamp or Bunsen burner to the zinc, which, in its state of fine division, will readily inflame. As it is slowly converted to a cohesive mass of oxide, the scale pan will descend, showing that in burning it has gained in weight.

The Belmont mine and mill, Montana, handled 1,008 tons of ore in January at a cost of \$5.50 per ton, and the total yield was \$10,270. Last year 10 stamps were added to the mill, 2,000 ft. of tramway were built, \$25,000 were spent in the mine, and yet there was a profit over all expenses. Over 40,000 tons of ore are claimed to be in sight or obtainable.

CARRISLE DISTRICTIESOME 30 miles northeast of Victorio, New Mexico, and 5 miles north of the line of old Mexico. It was discovered in March, by J. G. Crittenden, who had selected specimens from the grounds years ago and had them assayed. The veins are continuous and compact and have every appearance of true fissures.

The managers of the Dayton smelting furnace are experimenting with El Dorado canyon coal, to ascertain whether coke can be profitably made from it for use in their works.

Mining Share Market.

Although some people are expecting a "boom" very shortly in Comstock stocks, there are no special signs of it yet. We append the monthly statements of mines which show cash on hand and indebtedness. The following companies had cash on hand March 31st: Northern Belle, \$214,617.17; Standard Con., \$206,223.29; Western (Contention), \$68,431.43 in cash and \$77,500 in bullion; Silver King, \$72,950; Con. Virginia, \$18,847.38 in cash and \$10,784.30 in bullion; Bulwer Con., \$40,775.72; Chollar, \$29,378.43; Potosi, \$22,893.91; Gould & Curry, \$33,707.55; Crown Point, \$10,634.45; Utah, \$2,677.24; Silver Hill, \$2,143.61; North Bonanza, \$6,077.54; Flowery, \$432.94; Navajo, \$766.44; Occidental, \$8,560.67; Con. Imperial, \$2,140.21; Challenge, \$1,006.50; New York, \$65,366.16; Exchequer, \$6,894.17; Spaulding, \$658.72; Day, \$904.89; North Belle Isle, \$1,886.35; Julia, \$4,992.42. (The notes of the Julia company are still out for \$25,000 due the Ward company.) Bullion, \$20,342.29. (The Bullion company has an indebtedness of \$248,239.16, including \$235,000 due the Ward company.) Benton, \$16,184.04; Alta, \$17,419.94 in cash and \$52,322.37 to be collected from assessment No. 20.

The following companies had an indebtedness March 31st: Union Con. (overdraft) \$83,749.43; Overman, \$7,476.76; Caledonia, \$10,329.84. (The Caledonia has a balance of \$17,518.75 to be collected in assessments.) Lady Washington, \$5,406.65; Hale & Norcross, \$11,887.80; Sierra Nevada, \$4,654.25; Belmont, \$4,731.25; Equator, \$6,701.25; California, \$43,715.22; Ophir, \$5,294.14; Mexican, \$13,394.69; Metallic, \$7,974.47; Best & Belcher, \$7,497.24; Alpha, \$12,085.43; Grand Prize, \$15,327.64; Argenta, \$2,801.20; Independence, \$1,060.70.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports: Western, Mar. 26

14 ft wide of quartz, and assays from the croppings show \$11.10 in gold and \$5.30 in silver; total, \$16.40. Flat rock, both above and below the ledge, is even richer. Soil-dredge assay showing \$6.37 in gold and \$203.00 in silver; total, \$209.37. This rich float and the quartz of the croppings are identical in character. The new discovery is in Patterson district, which was organized some 2 years ago. One tunnel has been run in 150 ft and another 225 ft, but without finding the great *cata madre*.

**THE DISTRICT.**—*Free Press*, Mar. 29: The report that got about last week to the effect that a strike of extraordinary richness had been made in the Blackhawk was greatly exaggerated. The west crosscut from the bottom of the winze, 790 level, cut a 10-inch vein of very good ore at the edge of the shaft, that is all. Bodle Con. is drifting south on the Fortuna vein, from the bottom of the south winze from the 6th incline level (the deepest point yet reached in the mine), in very rich ore, which is of great importance as going to show that the vein grows even richer as it descends. Jupiter also appears to be making an important development in the south drift from east crosscut No. 2, 600 level, giving assays well up in the hundreds. Concordia shows continued improvement in the north drift on the large east vein, and the south drift on the west vein is still giving high assays. Con. Pacific is making a fine showing by its north drift in Pacific level No. 2, 600 level. Standards west crosscut on the 1000 level is still in favorable ground, and all the stopes in the mine are looking well. Toga is still driving the east crosscut, 982 level, and now in ground indicating the proximity of an ore vein. The north drift, 300 level, of Boston Con., shows the ore vein on that level to be increasing in width and holding its good grade. Syndicate is stopping and milling ore and shipping bullion. Sinking has been temporarily suspended in South crosscut, and the new drift is being made for the new hoisting engine, which is daily expected. Goodshaw is still sinking, and the Lent and Red Cloud shafts are being steadily pushed downward. Adenda is making some repairs in the shaft, where the ground is swollen somewhat, and will soon resume drifting to the northward. The north drift in the Stonevale ledge, 400 level, of Bulwer Con., is in 2 ft of ore. The standard's new and powerful hoisting engine is being put in position, and will be ready for work within 2 or 3 weeks. Work on the foundations for the powerful pumping machinery at the Lent shaft is progressing rapidly, all the machinery being now on the ground. The Noonday mill will start up again this (Tuesday) morning, with a new 350-horse power Harris Corliss engine and 10 additional stamps, making 40 in all—the largest mill in this section of the country. Pipe has been laid, and water for both mill and mine will be drawn from the Red Cloud shaft. Both of the Noonday mines are looking well.

## NEVADA.

**LIBERTY HILL W. & M. COMPANY'S CLAIMS.**—*Nevada City Transcript*, April 2: Mr. S. Wheeler, Superintendent of the Liberty Hill Consolidated and water company's mines, at Liberty Hill and Liberty Hill, left for New York Sunday, being accompanied by his wife. It is reported that negotiations are pending for a sale of the entire property of this company to a New York company, and the sale will be made as soon as the patent has been obtained. W. D. Apple has a force of 7 men employed working through a portion of the above company's ground, on shares, in order to reach his own claim, which has no outlet at present.

**PROSPECTING FOR RICH ROCK.**—*Grass Valley Union*, April 3: The Rocky Bar company is sinking a prospecting shaft near the western boundary of the claim, where it adjoins the McDonald & Mullen ground, to determine if any of that rich bonanza rock is to be found on their side of the line. A prospecting drift from the main shaft has been run in that direction, which will be opened upon the new shaft, and give good ventilation and a better chance to prospect the ground. About a year ago the Rocky Bar had very rich quartz in this portion of the ground, and it is thought there is more of the same kind to be found upon extending the explorations. The prospecting shaft is now down 90 ft, and will have to be sunk to the depth of 130 or 140 ft.

**DEERES MINE.**—*Transcript*, April 1: It is reported that another shaft to be sunk in the rich deposits was struck Sunday in the south drift of the Derby. The north drift continues to look well, and considerable gravel is being hoisted. The framework of the hoisting works over the new shaft is nearly completed, and the machinery will be taken up as soon as the shaft is in a fit condition.

**TRUE BLUE MINE.**—The hoisting and pumping machinery formerly used on the Nevada claim, near Sugar Loaf, in the district, has been removed to the True Blue shaft mine, in Little York township, near Mount Gro, and the work of putting it up there began yesterday morning. It will probably be in place and ready to start up within 2 weeks. The new incline of the True Blue was sunk 75 ft before water came in, requiring pumps. It will be put down about 300 ft before drifting is commenced. The prospects are flattering for a rich drift mine being opened there.

**ROUND MOUNTAIN.**—The owners of the Round Mountain drift claim have concluded to push their main tunnel into the bill a distance of 400 ft beyond the head of it at present. It is now in about 900 ft.

**THE PITTSBURGH MINE AND TUNNEL.**—*Grass Valley Union*, April 3: The drain tunnel, which is being driven under Gold Flat to the Pittsburgh mine, has reached a distance of 400 ft. The tunnel is now being driven on a level which it will strike at the 300 level. At the present rate of progress the tunnel will be completed by the 1st of June, when all the surface water from the mine will be drawn off, and the pumps started to drain the lower levels, which will soon be accomplished, as the bottom of the mine makes but little water.

**STRIKE AT THE BANNER MINE.**—*Transcript*, Mar. 30: A labor strike has been declared at the Banner mine, in the incline, at the Banner mine, disclosed a clearly-defined 3-ft ledge of sulphurated ore almost exactly similar to that worked in the old mine, and by milling assays found to be worth \$17 a ton. If the present highly favorable indications continue for 2 or 3 weeks more—and the case can hardly be otherwise—Supt. Brown will have a 10-stamp mill erected there as soon as it can be put up.

The Banner mine is taking men are taking some rich ore a short distance north of the Banner location, and various other parties are prospecting in the vicinity.

## PLACER.

**UPPER DIVIDE.**—*Placer Herald*, April 2: The mines here are running well and steadily. The Vein Emon mine, as usual, is paying well. They still pay the highest wages paid miners in this State. They claim that 15 good, experienced, well-trained hands will do as much as 25 in different hands, and will use less tools and require less supervision. The Wesko mine is employing about 25 men, and the mine is paying satisfactory dividends. It is under the supervision of Thos. E. Muir, a practical and experienced miner. The Baker Drive mine is now running in good shape, with a strong force of men.

**TUNNEL.**—Some time ago a survey was made from the ravine below the Masonic hall, to ascertain if a tunnel could be run from there low enough to tap the Wesko channel; a good site for a tunnel and outside works was found, and the feasibility of the undertaking demonstrated. The tunnel is now being commenced, and, judging from its dimensions, it will be a heavy undertaking. The size of the tunnel will be eight ft high and 10 ft wide, with a double track. Through the energy and perseverance of Mr. Muir, San Francisco capital has been enlisted in this enterprise, and he has the general supervision of the work. A tunnel 3,000 ft long will tap the channel and drain the divide for several miles. Barfield drills will be used, and a large over-shot water wheel will be used to run the tunnel, which will be run by compressed air also.

**THE DANIEL WEBSTER** is still showing well, and the owners are very busy with teams getting lumber and timber on the ground for the necessary buildings and works. The "Root Hog" Co., at Last Chance, has completed its new tunnel, and is now running. T. T. Darling's mine, at Deadwood, is paying handsomely, with every prospect of a long continuance of the pay dividend. Brickford & Co., of Deadwood, are taking out good pay. This is a new mine just opened, and bids fair to become a first-

class drift mine. Ray & Highland, at Last Chance, are still taking out large quantities of gold. They have a permanent paying mine. The same is true of the Sharp Stick mine, owned by Trull & Co., and adjoining the Ray & Highland mine.

## PLUMAS.

**ARCADIAN.**—*Greenville Bulletin*, April 2: A contract has been let to run 970 ft of tunnel, which will open out the mine at a great depth.

**GOLD STRIP.**—Supt. Standart reports work going ahead as usual at the mine. Twenty-four stamps are running on good pay rock, and there is no interruption of the prosperous activity which has so long characterized this excellent property.

**ATLANTA.**—This mill 10 stamps are running, and most of the miners are at work in the lower tunnel, and engaged in a general prospecting and development of the entire mine.

**SOUTHERN EUROPEA CO.**—The mill is running steadily and the quality of ore is very superior. Work in the middle tunnel is progressing, the lode constantly improving in width and appearance. The drift is now 20 ft in width, and in richness far surpasses the most sanguine expectations which had been entertained concerning it.

**PLUMAS NATIONAL.**—The mine is improving as the developments progress. The west chute is increasing in size and richness as the stopes are extended. Mr. Charles H. Aaron, who has been regulating the chlorination works, has them now in splendid working order, and the process of desulphurizing, chlorinating and precipitating is running smoothly. As an evidence of the perfect character of these works, the amount obtained is within 35 cents per ton of the assay value of the ore. There is scarcely a quartz vein in Plumas county but what contains sulphurates in paying quantities.

**THE BUSHMAN CLAIM.**—*Plumas National*, Mar. 23: The other day, while over in the Black Hawk region, we called on Messrs. Brown & Brummingham, the gentlemen who have leased the Bushman claim. They are taking out pay gravel, and are at work in a fine gravel channel as can be seen in the State. The miners take out the dirt through an inclined tunnel, the water being pumped and the dirt raised by the power of an overshot wheel.

**ANOTHER NUGGET.**—For years and years the fame of the big chunks of French ravine has been sounded by the East Branch miners, and the old gold has been worked over and over in search of them, but it seems that "the ore is not yet." A short time ago a Spaniard, who is known on the river as "Old Kosuth," succeeded in finding a piece of quartz and gold which was worth over \$300 French ravine is the spot on which is located the quartz ledge owned by Mr. F. B. Whiting, of this place, and several of the East Branch miners.

**THE GEM MINE.**—On Wednesday we paid a visit to the claims of Lee, Smith, Payne and Garrett, near the head of Buttery valley. The boys are doing a good business this spring, and with the aid of their little hydraulic outfit they have stripped quite a large piece of ground. The dirt is some 14 ft in depth, and carries some gold from the top down, but most of the pay is on the bedrock. They have not "bottomed out" much, as yet, but from some past prospects which we saw, in the gravel, it is safe to say that they will do a good summer's business. The gravel prospects at the rate of 12 or 15 cents to the pan, and the dirt, which is a short time ago a Spaniard, who is known on the river as "Old Kosuth," succeeded in finding a piece of quartz and gold which was worth over \$300 French ravine is the spot on which is located the quartz ledge owned by Mr. F. B. Whiting, of this place, and several of the East Branch miners.

**MORE RICHNESS.**—The old Western gravel claim, under R. Z. Bell's management, at Newtown, is showing up well. Work is being energetically pushed, and with success.

## SAN BERNARDINO.

**CLAIMANTS.**—*Colton Semi-Tropic*, April 2: There seems to be quite a number of claimants to the rich Waterman mine on the Mojave, now it has proven to be a good thing. The claimants are interested in showing Mr. Waterman the location of the mine, and Warren Wilson claims the whole thing under an old location made by his father, now deceased. Wilson claims the time of his father's location had not yet run out.

**EXCITEMENT.**—There seems to be no abatement in mining excitement in our county. The Mojave, Grod, Providence Mountain, Dry Lake, Ivanpah, Resting Spring, Salt Wells, Pinto, and all the other mining camps prove lively places and new discoveries every day.

**CONTRACT.**—A contract has been let by the Slover Mountain M. Co. for the sinking of a shaft 50 ft deep on their mine. The prospects become more and more favorable as the mine is more fully developed.

## SIERRA.

**COMPLETED.**—*Mountain Messenger*, April 2: The tunnel of the B. M. Ex. Co. is now in 3,400 ft, the last 1,000 ft having been completed on Wednesday. The tunnel is still all in gravel and some 5 or 6 ft above the bedrock. The strata lie about level. The gravel is all quartz and is pronounced first-class looking for top gravel by experts.

**THE CHICKEN.**—The Chickens, which makes the flat, commenced work again about the 1st of March. They succeeded in getting nearly all the water out of the shaft when, through an accident, they lost a pump, and have just succeeded in getting the mine clear again.

**JAKE WINANS** is running his hydraulic claims near his ranch below Dan Cole's. The gravel looks well.

## TRINITY.

**WATER.**—*Trinity Journal*, April 2: Hydraulic mines are running with a fair supply of water, considering the season. To this mine more than an average quantity of ground has been washed by the mine in this county. We expect to soon hear of some large clean-ups.

## TUOLUMNE.

**CHIEF.**—*Tuolumne Independent*, April 2: About two weeks ago a chipsa weighing 4 lbs was taken out of the Phoenix placer mine, a short distance east of Sonora, by John Rosasco & Co. while doing sluicing. The mine was lately owned by Si Reed, who sold it to the above parties. It is estimated that there is only 1 lb of quartz in the piece, leaving about 3 lbs of pure gold, and worth over \$600. The piece looks as if a part had been broken off.

## NEVADA.

### WASHOE DISTRICT.

**SIERRA NEVADA.**—*Virginia City Enterprise*, April 3: On the 2300 level the raise is completed and the station on the 1700 level finished. On the 2400 level cleaning out and repairing the north lateral drift. During the week 253 tons of ore were extracted. Bullion to the value of \$50,607.35 was shipped last evening.

**CALIFORNIA.**—During the past week 447 tons of ore, assaying \$21.75 per ton, have been extracted and sent to the mills. At the C. & C. shaft we are cutting out a bob station at the 2100 level. Bullion shipped last evening, \$23,483.50.

**CO. VIRGINIA.**—During the past week 306 tons of ore, assaying \$20.35 per ton, have been extracted and sent to the mills. At the 2500 level the joint California west drift to the C. & C. shaft has been extended 31 ft. Bullion shipped last evening, \$28,984.30.

**UNION.**—The shaft has been sunk and timbered 10 ft. Are repairing the shaft at the 2200 and 2500 stations.

**C. & C.**—The shaft has been sunk and timbered 24 ft below the 2500 level. A bob station is being cut out at the 2100 level.

**ORIGINAL KEYSTONE.**—The shaft is down 400 ft. The rock is becoming softer and shows seams of quartz. The water is handled without trouble.

**UNION CON.**—On the 2500 level the joint Mexican east crosscut has been extended 34 ft, the joint Sierra Nevada winze has been sunk and timbered 15 ft.

**MEXICAN.**—On the 2500 level the joint Union Con. east crosscut has been extended 30 ft, and the joint Gphir east winze has been sunk and timbered 16 ft.

**UTAH.**—During the past week the incline has been sunk and timbered 10 ft. The ground in the bottom is becoming somewhat harder. The south drift on the 2150 level has been advanced 10 ft.

**ORZIR.**—On the 2500 level the joint California east crosscut has been extended 33 ft, and the joint Mexican east

winze has been sunk and timbered 16 ft. Are repairing the main shaft, near the surface.

**ALTA.**—During the past week we have sunk and timbered the shaft 5 ft; total depth, 1,890 ft. We stopped sinking last Monday morning, and commenced excavating for a tank station at the 1850 level, and preparing the 1050 bob station to receive the bobs, all of which work will be completed during the coming week, when sinking will be resumed.

## CANDELARIA DISTRICT.

**NORTHERN BELLE.**—*True Finsure*, Mar. 20: The crosscut from the 4th level drift has been driven a distance of 21 ft, and the formation shows more favorably. The other shaft levels took fully as well a week ago. In the section of the mine above the adit level, the work has been attended with good results. The daily product of ore is about 55 tons. Both mills are running steadily and doing their usual good work. The bullion shipments for the week ending March 23d amount to \$24,551.25; and shipments on March account to \$73,757.11.

**MOUNT DIABLO.**—This showing here is very good for first-class ore, and the prospect is as good as it is ever been. The mine is being worked on the 1st level, and the north crosscut on the third level has advanced 14 ft, and is in favorable ground with a showing of low grade ore. The north crosscut on the second level shows a good streak of \$30 ore in a westerly drift.

## ESMERALDA DISTRICT.

**A MILL.**—*Esmeralda Herald*, April 2: For some time W. H. H. Buckley has been straining every nerve to accomplish an object so much needed in our camp, i. e., the interesting of capital in our mines. His efforts have at last been crowned with better success than the most sanguine ever dared to hope. The company interested have secured the Cortez and Seminoles mines, and on Monday morning Supt. Buckley will start as many men at work as can be advantageously crowded into the mines. A tunnel will be run from Cottonwood gulch to tap the Cortez and Seminoles, which will strike the ledge in the former at a depth of 150 ft, and the latter at 400. Ore will be extracted from the incline already run in the Cortez, so that when the 10-stamp mill, which the company will put up immediately, is finished there will be a supply of ore on hand. The plans and specifications have been accepted, the lumber and machinery ordered, and work will be commenced on the foundation for the mill just as soon as the frost gets out of the ground, which will be in one to three weeks—owing to the weather. The mill is to be erected on the old Napa mill site, half a mile below town. Part of the machinery comes from New York and part from San Francisco. The company mean business, and are going to work in earnest and in the right way.

## GRANTSVILLE DISTRICT.

**ALEXANDER.**—*Cor. Bonanza*, Mar. 20: Since my last report we have advanced 10 ft in Alexander incline. Ore rapidly improving in value, and changing from zinc glance to antimonial, and the look of the ore is better. The great stopes in No. 5 east show bigger every day. Almost perpendicularly under this an upraise from No. 6 has developed a solid mass of sulphur. The new boiler is in place, and works to our entire satisfaction.

**BROOKLYN.**—In the Brooklyn incline we have advanced 11 ft during the past week, the formation indicating that we are not far from the ore. In south crosscut No. 2 we have reached the same body of ore that we have above, between levels, showing, however, a great improvement in grade as it steadily changes from zinc glance to antimonial.

## LEWIS DISTRICT.

**COAL MINES.**—*Reville*, April 1: A lot of coal from one of the veins of this mine, near Lewis, was taken to Austin to be tested, and was burned in one of the Manhattan offices. It made a splendid fire, and the ashes are to be weighed for the purpose of ascertaining the percentage of waste in the coal. A good mine anywhere near the railroad would be a very valuable piece of property.

## MOUNT GRANT DISTRICT.

**MILL AT MOUNT GRANT.**—*Esmeralda Herald*: S. L. Hanek has made the necessary arrangements, had the papers signed, sealed and delivered, and is now on his way to Virginia city to get a mill for the Big Inge M. & M. Co. at Mt. Grant. He informs us that it is his intention to have the stamps rattling in 60 to 90 days on the richest first-class quartz in the State. At the end of this summer, says Mr. Hanek, "we will be able to take 500 men to work in Mt. Grant district, and thousands of dollars in bullion going out every day. The Big Inge is well named; she's a daisy." Mt. Grant district is 7 miles from Hawthorne, on Squaw creek. There is abundance of wood and water for mining and milling purposes, and good sites for mills. Most of the veins are small but very rich.

## MOUNT ROSE DISTRICT.

**PROMISING.**—*Silver State*, Mar. 20: If Dame Rumor can be relied upon, the mines of Mount Rose district are giving better signs of promise than for a year past. All are hopeful, and a great many are very sanguine that the mines will soon develop a brilliant product of metallic wealth.

## SIERRA DISTRICT.

**THE GEM MINE.**—*Silver State*, April 2: A force of miners is now at work on the Gem mine, which is situated about 20 miles south of town, in the East range. We are informed that the mine is producing considerable rich ore, 2 tons of which were recently shipped to San Francisco to be reduced. Years ago, the Gem produced considerable ore which worked from \$400 to \$600 per ton, in the Pioneer mill, at Unionville. The ore is principally chlorite and horn silver, specimens of the latter assaying as high as \$13,000 to the ton. The vein is generally small, but rich, and is crossed by the Gem mine, which makes the mine a very valuable one. Although Sierra district, in which it is situated, is noted for its gold mines, the Gem ore scarcely carries a trace of that metal.

## ARIZONA.

**CAYE CREEK.**—*Cor. Exposition*, April 1: Panther No. 2 is the best mine in the district at the depth of 50 ft. Mr. Hickles has gone to work on Philes' mines, opening the different claims. Philes has struck rich ore in the Gageon. Philes 30 ounces silver, 315 gold, and 452 lead. Bully for Philes, who they say is a rustler, and deserves all he will get.

**CENTENNIAL.**—At the Centennial, work has been going ahead steadily under the efficient management of Supt. A. S. Blake. Within the past 21 months they have sunk incline shaft No. 1 to a depth of 93 ft, and 323 ft of drifts have been run. A continuous body of ore has been developed in the shaft, and in the drifts the ore is continuous for at least four-fifths of the distance drilled.

**GUR MILLS** are doing good work at present. The Mack Morris is running steadily and making regular shipments of bullion. The Globe is reducing an average of 7 tons of Alice ore per day—the bullion shipments averaging about 3 bars per week. The Stonewall Jackson is also doing steady work on the rich ore body found in the lower level.

**WORK** was suspended at the California mine about 10 days ago, but will be resumed this week, and it is expected that some important developments will soon follow.

**A MEXICAN** was in town last Sunday exhibiting a nugget of gold weighing 10 ounces, for which he was offered \$80. It was found in the placers of Lost gulch, about 2 miles west of the Golden Eagle mine. He says that one can easily make \$5 a day in that locality by using a common sluice box.

**MR. W. B. HELLINGS** is pushing work on the South Placer mine, in Mineral Creek district, with a full force of men. He proposes to ship his ore to San Francisco, which is *prima facie* evidence of its high grade.

## IDAHO.

**A MILL WANTED.**—*Yankee Fork Herald*, Mar. 26: A brief interview with some of the leading millwrights on the Yankee Fork led to a further interview with one of the leading saw mill firms on the river, we are permitted to make public the offer of the above parties respecting the constructing of a 10-stamp custom mill, with chloridizing

roasters attached, to be built at any convenient point on or off the Yankee Fork in the Yankee Fork mining district. The proposition above referred to is that the saw mill firm will cut and furnish all the lumber and timber needed in the construction of the mill at the lowest market rates, and take the pay in stock of the mill when the same is completed. The millwrights offer to do all the work of putting the mill in perfect running order from the foundation up, and take their pay for their labor in stock of the mill.

## MONTANA.

**ALICE.**—*Butte Miner*, Mar. 29: The ore bodies in all the levels of the Alice are looking fine and are worked vigorously with a daily output from the mine of over 80 tons. The immense ore bodies explored and in reserve can hardly be described in a brief report. Sinking the winze from the 500 to the 700 level goes on, with first-class ore coming out of all the stopes and levels.

**NARAGANETT.**—The Naraganett mine has been heretofore opened and developed to a considerable extent and some very good ore has been found in it.

**NARROW GAUGE.**—The Narrow Gauge mine is located about 3 miles west of the Gagnon, and is a property that has been developed considerably. The mine is owned by John Strocher and August Mills and is looking quite favorable just now. A main shaft has been sunk to a depth of 120 ft. The mine is in a granite formation.

**SILVERSMITH ARMY.**—The Silversmith-Army mine has been incorporated, under the new corporation work is to be commenced on the mine soon.

**LEXINGTON.**—An excellent quality of ore is hoisted daily from the shaft. The quality averages up, and some of it is very rich. Sinking operations are about to be resumed at the 600-ft shaft of the Lexington. This shaft had reached, last fall, a depth of 130 ft when work was stopped, awaiting the erection of steam hoisting and pumping machinery.

**MOULTON.**—Everything is busy at the Moulton mine. The dropping of the 3-compartment shaft is somewhat slower than heretofore, as the rock is harder. The shaft has now reached a depth of 280 ft. There is no sign of water yet. The double cylinder hoisting engines are in position. The foundation is ready to receive the 3 75-horse power water-tube boilers. Four Ingersoll drills arrived a few days ago. These drills are the largest ever brought to Montana.

**MOORE.**—Work of sinking is now going on, with a vein of about 2 ft of good ore at the bottom of the shaft.

**VALLEY.**—On the Valley mine, Upson & Co. have put down a shaft well 75 ft. The ore vein is 6 ft wide. Level running is going on from the main shaft.

**SUNNYSIDE.**—The main shaft on the Sunnyside mine is down over 100 ft. Two ft of ore in the bottom assays 30 ounces in silver to the ton.

**PHILIPSBURG.**—*New Northwest*, Mar. 20: Successful development continues to be made on the Grants Mountain mine. The 120-ft shaft, and the tunnel run on the lode 70 ft beyond the shaft. The vein is 7 ft wide.

**TUS ALGONQUIN** is in the crosscut 35 ft, and will soon be stopping out ore again.

**A NEW ROAD** has just been finished up Frost gulch to the Cliff mine and the ore from this mine will be running through the Hope mill in a day or two.

**ANOTHER 40 MEN** are working in the Trout mine.

**THIRRA** have been about 75 men lately discharged from the Salmon and Emma mines and Algonquin mills, causing a depression in the labor market.

## NEW MEXICO.

**NOGAL.**—*Gazette*, Mar. 29: A new strike has been made in the Nogal district. This is known to be one of the richest mines in the Territory. The main lead has been lost in sinking the shaft on account of the bending of the lead, and the workmen were at a loss to know what to do. When Prof. Robertson was at the camp a week or so since he ordered the shaft to be cut further down the hill. This was done, and the result has been to strike the original lead. It is clearly defined and 4½ ft wide. This mine is to the Nogals what the Homestake is to the White Oaks.

**CIMARRON.**—Mr. Frank Hoxie, of the Cimarron M. Co., was in town yesterday. He reports that the machinery of the Cimarron is being worked, and will be rapidly put in shape under the direction of Capt. Fletcher.

**NOTES.**—*Arizona Journal*, Mar. 31: Dr. Fox, formerly a prominent citizen of St. Louis, but more recently from California, reached Tucson yesterday from a trip through New Mexico. He says the mining prospects in the vicinity of Silver City are good, but there is little development save on the Brannen mine, which is being steadily worked. He is turning out some very fine ore. Dr. Fox has been working this mine successfully for some years. A provoking incident happened in connection with this mine the other day which illustrates the absurdity of implicit reliance on expert testimony. Parties in St. Louis were anxious to buy the mine and sent out an expert to make an examination. The scientist, upon his return, reported against the property, and the sale was defeated.

## OREGON.

**PROSPECTING.**—*Bedrock Democrat*, Mar. 30: Several parties are getting their equipments ready for prospecting our hills in search of mineral deposits. No section of mineral country on the coast presents a better field for the prospector to commence operations and be duly rewarded. Enough rich discoveries have already been made to show conclusively that rich deposits of quartz exist in the hills all around us, and in the gulches, placer claims of immense wealth.

**THE CALIFORNIA.**—*Democratic Times*, April 1: A correspondent sends us the following news from Josephine: The California gold and silver mining company will soon commence operations in order to get their claim in running order for next season. They have excellent ground, which they intend to work with a large-sized giant as soon as their ditch is completed. Deselles & Co., at Scotch gulch, have finished piping for the season, and are getting ready to work their elevator. If error of Butler gulch, is running steadily with a few more men, will continue ground-slucing for a month or longer. Wimer & Simmons are piping night and day, and have made a grand showing in the line of moving ground with their little canal and big giant.

**NOTES.**—Cleaning up is becoming general. More rain would be greatly beneficial. The mining season is beginning to obb. S. W. Lackland has sold his interest in the Palmer Creek diggings to Chin Lin for \$1,500. The warm weather is melting the snow in the mountains, keeping up the supply of water in the big ditches. A. Kester informs us that a piece worth \$45 was recently picked up in Gold-worth & Co.'s claim on Foot's creek. A promising quartz ledge has been found near Canyonville, and some excitement exists there in consequence. McDonough, Kahler & Co., at Fort Lane, are cleaning up, and have found several pieces of gold worth from \$25.00 to \$30.00. More white miners are at work in Galice Creek district than ever before known. Several new claims are being worked there this season. Frank Bills has sold his mining interests to Jackson to A. D. McKee, and purchased the interests of George Armstrong and John Haskins in some mines on Sterling creek. A. W. Sturges informs us that the miners of Jackson district have had a very good haul of water this year, and that a large amount of ground has been stripped. All are sanguine of a good clean-up. Hays & Magruder, mining on Rogue river, recently made a partial clean-up that proved highly satisfactory. They will make a general one before many weeks, and the best of results are anticipated.

## UTAH.

**THE REBELLION MINE.**—*Salt Lake City Tribune*, April 1: From a gentleman just down from the Park, we learn that the Rebellion has a vein averaging 7 ft in thickness of solid ore, mainly carbonate, but with blotches of galena. It assays 50 ounces in silver to the ton, and carries about 50% lead. The chamber has been cut through for 400 ft. The mine is a good one, and goes into the mine the carbonates are thick. The gentleman, who is an old miner said: "I never saw a finer mine anywhere, and there can be no fair estimate placed upon its value." This is good for the "Rebels," and good also for the Park and the Territory.

## Visit of the Journalists to Southern California.

The following, written by Wm. H. Barnes, Secretary of the Pacific Coast Press Association, for the *Weekly Call*, contains so much that is briefly and well said, that we are constrained to give it at this date for the benefit of our readers:

The residents of Los Angeles and San Bernardino counties last June, through L. M. Holt, of Riverside, extended an invitation to the Pacific Coast Press Association to visit the citrus fruits of those two counties, and "to bring their friends with them." The railway authorities were interviewed, and through the courtesy of ex-Governor Stanford a very low rate of fare was obtained.

On March 21, 22 excursionists, representing 13 daily and 33 weekly publications of California, left San Francisco on the four o'clock P. M. train. Among the party were those who had grown gray in journalism, while others could give experiences in the service of the press for 30 years each. Some 30 ladies were included in the number, and good will and enjoyment ruled the hours as the express train sped along.

Quarter past eight o'clock P. M. at Lathrop for supper (and a good one), with the patterning train for an accompaniment, and then on through the dark night. At six o'clock A. M. of the 9th, Caliente was reached, at the foot of the Tehachapi mountain; all were up and eager to see the celebrated "Loop," the tunnels, engineering, etc. Your correspondent was personally given a ride in the car, and the engineer, and the climbing up hill began. A rain-storm, which ended in a heavy fall of snow, continued for more than two hours, interfering sadly with the views along the line, but sufficient was observed to pay a merited tribute to the engineering and energy which have built such a magnificent road through such a wild, forbidding country. Tunnel after tunnel, curve upon curve, until at last the summit is reached, and snowfalls are carried into the car to keep company with the winter winds and rains.

A downward run of 20 miles, and Mohave, the station for breakfast, is reached, a sort of created oasis in the desert; its surroundings merit its name—the land of desolation! A half-storm prevails at this point, and a wind blows, against which it is difficult to stand. The simple breakfast is quickly disposed of, and the shelter of the home-like cars sought. Miles upon miles of level waste are all around, with naught of even vegetable life, except the world desert yuccas standing like ghostly sentinels at regular intervals. As they disappear in the distance a rainbow shows its bright bow across the sky, not very promising for the day's weather, however, as the song says:

"A rainbow in the morning  
Is the sailor's true warning."

And sure enough, there is rain and to spare, in a little while. But sunshine comes again, the great San Fernando tunnel, one and one-quarter miles long, is passed, and at 1:55 P. M. "on time," Los Angeles is reached. Here there is but a brief stop for dinner, and the "express" moves forward until 7:10 P. M. when Caliente is reached, and the excursionists are met by Mr. Holt, of the *Press* and *Horticulturalist*, who, with a committee of his fellow-citizens, is present to conduct the excursionists to Riverside, eight miles from the station. Carriages are rapidly filled, assignments to hotels and private residences quickly made, and the excursionists are quickly cleared and the party on the road to their resting places. Bonfires and illuminations are passed, and many shouts are given and returned, amid the sound of rattling wheels.

March 10th, at nine o'clock, the party were about for a drive about Riverside. In each carriage was a resident familiar with localities, etc., and it is not exaggeration to remark that during the three hours' drive, said excursionists acquired more practical knowledge in regard to citrus fruits and the possibilities of southern California than they could have gained in any other manner. To begin, ten years ago, the land was an uncultivated plain; to-day, it is a Garden of Eden. More than 20 miles are driven over broad avenues bordered with palm and magnolia, and rows of groves of trees lined with oranges, lemons and limes. Acres of vines are seen, the famous Riverside raisins come from. Inquiry finds that apricots, figs, and scores of other luscious fruits are also grown in this favored locality. What has done it all? Brains, pluck and water—the first two in the individual, the latter on the land. Neither could have succeeded by itself, but combined, they have proved conquerors.

### Riverside

Is a colony of cultured, enterprising people, some 1,300 to 1,500 in number, living in a locality where plenty of water is furnished by an irrigating company, and where almost every tropical fruit can be raised successfully and profitably. Unimproved land, with water privileges, can be bought for \$100 per acre, while it would take \$1,000 an acre to buy some of the improved. There are many handsome homes in the colony, and the social and moral status of its people is not surpassed by any locality. Their hospitality and enterprise is proverbial, and no guest mar, unless he needs the home-served prosperity. This colony can but advance in population and wealth as time passes.

At two P. M. lunch is served at the Riverside and Glenwood houses, after which the citrus fair is visited. To say that the display astonished the visitors is to speak mildly. Here were between 30 and 40 varieties of oranges (one orange 18 inches in circumference), a dozen kinds of lemons, raisins that made the imported article seem common, figs, plums, olives, etc. By common consent the excursionists were taken to southern California had been but feebly and imperfectly understood hitherto, so far as this party was concerned—that its productions and possibilities had been entirely underrated; but that if forgiven for our unbelief and ignorance in the past, we would endeavor to do it justice in the future.

At eight P. M. a generous welcome was given by the citizens at Odd Fellows' hall, and sentiments and responses filled the time most pleasantly.

March 11—Eight A. M., and away to Colton, where Mr. Benedict takes a receipt from Mr. Morse, of the San Bernardino Committee, for "70 excursionists in good condition." and now comes a visit to the pioneer orchard of Mr. Van Leuven, and the visit to the citrus fair, which was begun in 1857; then to the home of J. A. Waters, and now by the ruined above walls of the old Mission, and next a rest at the lovely grounds of Mr. and Mrs. Crafts, known as Crafts. There is a long drive to the old-fashioned porch, loaded with the handwork of the ladies of the colony. The morning neighborhood. Delmonico never saw such a table, nor has it like ever been seen in San Francisco. Fruits, flowers, ornaments and substantial, and for waters—the fair donors of the feast. By common consent the excursionists were taken to Judge Willis was hearty and sincere, and the responses equally so.

In to-day's travel of 40 miles, orchards and grain fields, vineyards and grazing lands, are passed. Here is plenty of good land at low prices, and it is needless to say that every acre of this area profitable is to be used which has been used elsewhere, viz.: Brains, pluck and water. New San Bernardino, a handsome, well-built town of about 3,000 inhabitants is reached about 6 P. M.

The entrance of the excursionists was the means of gathering great crowds upon the streets. The San Bernardino Brass Band had kindly volunteered its services to the committee, and had been with the party all day, enlivening the hours with good music, and as the cavalcade of some 30 carriages drove into town, with said band at its head, it was very attractive to the ever-present "little people" in the vicinity, and the old folks had to be around to look after the "little ones, and the little ones were a crowd, you know." Notwithstanding which all were comfortably provided for at Starkey's and the Southern hotels.

March 12—A 6 A. M. call, quick breakfast and a three-and-a-half-mile drive to Colton, where was met L. M. Holt with a box of Riverside oranges, each four or five in number, delivered with many thanks by all. 7:10 train two and a half hours by rail and the Los Angeles committee is met at San Gabriel, and with teams are visited the great vineyards and groves of Messrs. Adams, Wilson, Stoneham, Shorb, Rose and E. J. Baldwin. Miles of vine and trees, and the party wears with the wealth before it. "Lucky" Baldwin insists that the party shall make at least a brief halt at his elegant residence, which is done, and an hour spent with this genial host, looking over his beautiful home and grounds, and a wandering in hot-house and on lawn, viewing the well-known racers of his stable, etc.

Next to Sierra Madre Villa, the beautiful retreat at the foot of the mountains, the excursionists find the most beautiful vineyard and foliage. Here a couple of hours are spent in enjoyment, and a view across the valley from this elevation of 1,200 ft. above sea level, is grand beyond description. Groves, vineyards and green fields lie like a picture before the gaze, and the question comes again, "What will a few more years ago this was but a trackless waste?" But it was even so.

Again a move is made, and the new land of Pasadena, another home for the citrus fruits, is visited. Here are homes of culture and refinement, and springing orchards and growing vineyards. What will a few more years ago, when so much has been done in so little time? At 6 P. M.

the ancient city of Los Angeles is reached, and the Pico House and Cosmopolitan receive the excursionists within their commodious quarters, just as a hoisterous wind begins to make its presence felt.

At 8 P. M. the Los Angeles club throws open its new rooms to the P. C. P. A., and extends a greeting to the visitors through the chairman, Judge Sepulveda, and the hospitality of the club, during the visit of the Association. After a meeting of the P. C. P. A., and the election of several new members, the evening was spent in social converse between the visitors and visited.

Sunday and Monday, 13th and 14th, were used in inspecting the City of Angels, of which so much has been written. Its old churches and adobe houses strongly contrast with its newer edifices. Here are found the old Spanish families and the latest arrival "from the East." The past and the present, "old times" and "Young America," are in the juxtaposition in Los Angeles. But a kindly greeting comes from all, and at evening, around the grand banquet table, over which ex-Governor Mansfield presides, are gathered the representative sons and daughters of many honored families, who bid a welcome to the visitors of the Press, which was keenly appreciated, and will not be forgotten.

In Los Angeles is the Wolfskill orchard, with its 40 acres of 40-year old orange trees, each one of which lifts its branches laden with golden fruit to the number of thousands. This grove alone returns a fortune every year.

The Citrus fair was visited on the 15th. The large Pavilion permitted display, and ten of thousands of oranges and lemons were in sight. The fruit of Santa Barbara, Ventura, Santa Luis Obispo, San Diego, and San Diego were here, in magnificent array. Language fails to convey an idea. Some one wrote of these Citrus fairs that "it was worth crossing the continent to see them." I endorse that sentiment, and the Californian who can raise a good crop of oranges, who bid a welcome to the visitors of the Press, which was keenly appreciated, and will not be forgotten.

On the 15th the excursionists disbanded, to return as they pleased, and the first trip of the Pacific Coast Press Association was over. More than 1,000 miles by rail and 120 by ocean had been traveled without an accident. Seventy-two people had been together for 10 days without an unkind word, a single jar or unpleasantness, or a word of politics, and it gave all more confidence in human nature than they had before. It was a rare opportunity to see part of their State, which is a pleasure and delight, at a reasonable price; second, it enabled a class of men who rarely get away from hard work a little recreation, and it gave them a correct idea of southern California, which they did not have before; fourth, it pleased the people visited, as it showed appreciation of their efforts and commendation of their enterprise and energy, which they most emphatically deserve; fifth, it proved that the excursionists were not only a pleasure to the people they associated together for days and "agree to disagree" in harmony and good will.

I have noticed in one or two journals an effort made to convey the idea that those who went upon this excursion were not regular or known journalists, etc.; but as one fully acquainted with those who were present, and with their reputation and services, I will merely say that some of the oldest editors of this State were among the number; that 22 journalists were represented by their own editors, and the others by reporters duly accredited by the managers of said journals. As to the P. C. P. A. itself, none but bona fide editors or proprietors are eligible to membership.

There is no doubt that the P. C. P. A. had a most delightful time, and experienced a succession of pleasant and enjoyable surprises. There is also no doubt that all would be pleased to go again to this or some other locality, and that a vote would be given unanimously in favor of the next excursion.

[Mr. Barnes modestly omitted mention of the presentation, by members of the association, of an elegant gold-headed cane to the President of the association, Scipio Craig, and a fine diamond ring to the Secretary. The whole-souled manner in which our southern friends universally extended their hospitality to the party, certainly reflects credit to the name and generosity of each.—EDS. PRESS.]

### Diseases of Miners.

In the *Popular Science Monthly* for March, a summary is given of the diseases of miners, as they have been specially studied by Dr. Paul Fabre, of Commeny, France. The diseases prevalent among workmen who labor in damp or wet galleries are largely governed by certain accessory circumstances. No morbid symptom is developed among those who work in a gallery which is simply damp and of a temperature not exceeding 58°. But if cold water falls upon them, or if they have to put their legs in water, they become subject to lumbago, sciatica, to indefinite pain in their limbs, and often rheumatism, generally subacute, sometimes chronic, most frequently localized in a single joint—generally that of the left knee, on which the pickmen and heavers rest in working. In galleries saturated with moisture, and where the temperature exceeds 70 or 80°, the workmen are soon overcome with an extreme lassitude; they get hot, they gasp for breath, the sweat rolls down their bodies, and they are obliged to stop working and rest for awhile in a cooler spot. A rapid evaporation compels frequent change of the men in the gallery, and endural or military eruptions occur, sometimes boils, rarely eczema. If, while the gallery is constantly damp, the air is vitiated by poisonous or irrepressible gases, and if the water contains sulphates or sulphuric acids in solution, the men, in addition to pains in their limbs and difficulties in breathing, experience lively itching and painful smarting wherever the surface of the skin has been abraded. Those who have labored for a long time in the damp galleries contract a chronic inflammation of the gums, together with muscular pains in the limbs, and have often intestinal troubles and spots of purpura. These phenomena indicate the coming of a mild form of scurvy. The remedies are improvement of the sanitary conditions of the mines and the homes of the miners, and the usual applications for scurvy whenever the symptom of that disease appear.

**RICH DISCOVERIES.**—A letter from Pitkin, Colorado, says that great excitement prevails there over the discovery of carbonates, and the whole Park, clear down from the Silver Islet mine is being staked off by an eager and lazy mob of men. A body of gray sand carbonates, 4½ ft. thick, has been found in the main shaft of the Silver Islet, at a depth of 50 ft. Assays give 132 ounces of silver, 168 ounces and 264, and about 40% of lead. In the Garfield lode, situated in the Park, carbonate running as high as 170 ounces of silver and 60% of lead were discovered at a depth of 60 ft. The Chicago lode is proving one of the best in the district. The shaft is 60 ft. deep, and an adit-tunnel has been driven in on the vein 85 ft. Further down the hill a tunnel has been started that will cut the vein 300 ft. deeper than the above named workings.

## Washington Territory Mines.

### The Silver and Gold Districts.

The Smilkameen, or Mount Chopaco, silver mines in Stevens county, Washington Territory, are about 15 miles by trail west of the junction of the Smilkameen and Okanagan rivers, near the line of British Columbia, about 120 miles east of Port Hope; the same distance west from Fort Colville, and 200 miles northwest of Ellensburg, in Kittitas valley, Washington Territory, which is on the main traveled route, and the trade center for all the gold and silver mining districts of the Swank, Peshastin, Wenatchee, Methow and Smilkameen; being, also, on the old miners' and military routes from The Dalles in 1856 and 1865, and making a shorter distance from Portland by nearly 300 miles than any other route, besides being through a settled country and having every facility for the camper in provisions, outfit, grass, wood and water.

A correspondent of the *Oregonian* says: The silver mines of best promise are in the treeless mountain just opposite Mount Chopaco, and this silver mountain, or mountain of silver, was thrown into mass by internal upheavals, and separated, or elided off, from Mount Chopaco by the after period of channeling waters, as in river-ravine process they receded from their ocean region. The landscape is at once grand and awe-inspiring. It impresses one with dread and veneration. Bold Mount Chopaco rises suddenly abruptly, and almost perpendicularly to an elevation of 6,000 ft. above the river, and is presented in its Indian legendry and magisterial character by all colors, classes and sizes of massed rock and shades of etripes in shale and shelving boulders.

The summit is closely dotted with evergreen cedars, firs and pines, while around its base run the beautiful, clear, cool, pure, snow-sourced waters of the silvery Smilkameen river, which is fringed on both of its borders with groves of cottonwood, willow, wild cherry and alder. On both sides of the rapid-running river are level flats of land of good soil, densely covered with grasses of all kinds; and, through the "Coolies," are very picturesque lakelets, meadows and shimmering creeks. Around the mountain of the mines, which rises between the Okanagan range and Mount Chopaco, and which has an altitude of 1,500 ft. from its base, the Smilkameen river crescents like a horse-shoe bend, and on both sides of the mountain do the quartz ledges crop out on the surface in plain view for miles in length of the range, while the greater and still grander portions of the range are, as yet, unexplored, unprospected and uncared for.

There are several ledges worked, and one tunneled to quite an extent, yielding a fine view of mineral in eight that has assayed very largely to the ton, and will, on further deepening and development, yield as rich a return as ever Nevada or Colorado's champion mines produced. The true discovery of these Mount Chopaco mines was made seven years ago, and their real worth is not yet ascertained; enough being known now, however, to cause the formation of large and wealthy mining corporations to invest heavily in their near development. Companies are being formed in San Francisco, Chicago and New York.

The founder of the mining district is Hiram I. Smith, the well known old miner.

Edward Phelps, Marshall Blinn, Henry Wilington and R. L. Johnson have large interests in these mines, and as they are all largely known for enterprise, the Mount Chopaco silver mining district will, without doubt, loom to fame and fortune in 1881.

It is well known that the richest mineral lands in Washington Territory are in and on the Moses reservation, and it is also well known that Moses himself is not, and never intends to be, on that reservation. His garden home, and that of his fathers, is in the Grand Coolie east of the Columbia river, and there he will habitate, all grants to the contrary notwithstanding.

There will be considerable work done in the Peshastin mining district this season. This gold-bearing district is a ready source of permanent wealth to the actual miner, and it is too well known to need further comment. It is 40 miles north of Ellensburg, has several arastras running in the summer season, and its miners, like all large bodies, move slowly, for reasons best known to themselves; and they, being all "old timers," have sense enough to keep what they do know from spoiling. They all have what gold they want, and that ends it.

The Swank mining district is 25 miles north of Ellensburg, and has the reputation of producing, occasionally, the largest gold nuggets found on the coast. It is settling up very rapidly with practical placer miners, and is on the eve of great distinction. It is in a grand country, well supplied with wood and water, and supposed to be at or near the richest "gold diggings" outside of California. It is an old mining district, first worked under the supervision of King Solomon, of temple fame, who called this whole upper country "the land of Ophir."

**ARTESIAN WATER IN BOSTON.**—For some time past boring for artesian water has been in progress in Providence street in the city of Boston. The chances of success were generally believed to be against the effort. Quite recently, however, water has been found at a depth of 1,550 ft., and the well is now capable of delivering from three to four hundred thousand gallons of water a day.

## The Monolithic System of Breakwater.

Mr. Kinipple, harbor engineer of Westminster and Greenoch, has patented his monolithic system of forming sea breakwaters and harbor walls. This invention enables harbor works to be constructed in jointless masses of concrete *in situ* without the aid of divers, stagings, or overhead travelers; in fact, without the use of the ordinary costly plant. The system has been experimentally tried with success at New York, Quebec and Greenoch, and last year it was also experimentally used by the patents at Wick, in the reconstruction of the south pier-head upon its old, or rubble foundations. The Government Loan Commissioners granted a sum of from £10,000 to £12,000 for these repairs, and for the extension of the head this year for 40 ft., so as to render last year's repairs safe against any seas which may enter the bay of Wick. The extension will be of the same monolithic construction, and founded deep into the hard clay of which the bottom of the bay is composed. At Wick any breakwater which is not of monolithic construction from foundation to parapet cannot be relied upon as safe against all contingencies of sudden and severe storms. There are numerous places, it is believed, where, had this system been used instead of the ordinary blocks or bags, the breakwater would have been in existence at the present time, and at 40% less cost. One of its chief merits is its simplicity and reliability, for any breakwater in the most exposed localities can, it is asserted, now be constructed at about one-half the usual cost, and certainly within one-third of the time formerly occupied in executing these works, for there is nothing whatever to prevent breakwater being commenced at its head, center, or foot, or being carried on simultaneously from end to end. No skilled workmen beyond ordinary laborers or fishermen are required, and, indeed, a present of a hatch of Portland cement to some of the poorer fishermen is all that is necessary to enable them to repair or construct small breakwaters along the coast. The system is well adapted for founding on rocky or irregular bottoms, but in many cases trenches would have to be dredged by dipper or other dredges for the reception of the concrete. The concrete is mixed either in bulk or in blocks, and allowed to set or harden out of water, so that when thrown overhead into the foundations or works it is hard enough to prevent the cement from separating from the sand and shingle while passing through the water, and soft enough when in the work to fall together and to become one compact mass, equal in strength after a short time to the natural rocks. Where the walls are required to be vertical or battered, a few iron rods are used with sliding planks to retain the concrete in form for a few days until it is set. At Wick recently, masses of concrete cast in this manner resisted a heavy storm within 24 hours after they were put in, while stones of several tons weight were hurled in every direction by the same gale.—*Engineering and Building Times*.

**THE TALES OF OLD MINERS.**—An Eastern exchange says: An old miner, who has had 15 years' experience underground, says that he has observed one peculiar fact, that between 12 and 2 o'clock in the night if there is a loose stone or bit of earth in the mine it is sure to fall. Says he: "About this time it seems that everything begins to stir, and immediately after 12, although the mine has been as still as a tomb before, you will hear particles of rock and dirt come tumbling down, and if there is a caving piece of ground in the mine it is sure to give way." This is of a piece with the old story about water mills doing more work in this night than in the day time, because of the water being heavier in the night than during the day—pressing more strongly toward the center of gravity, and therefore bringing more force to bear on the wheels. It may be that in some localities water mills would do more work of nights in hot weather than during the day, as, on account of a suspension of evaporation in the stream, there would be a little more water. It is about midnight that ghosts walk, as is told in old tales, and therefore it is probable that about that time some old miners may be making more diligent use of their ears than at other times. Rats begin to run about the mines before a big cave, and serve as a warning to miners in old levels, but this is because these animals first detect the movement caused by settling in the waste rock filling among which they live, and probably begin to find themselves pinched in their holes.

**BIG FIND.**—Last Wednesday old Uncle Dan Breen came into town and surprised the citizens with evidence of his perseverance and industry in mining, by exhibiting a specimen of solid gold recently taken from his claim, on McCal's flat, Merced river, weighing 21½ ounces, and valued at \$350. This, together with \$60 in coarse gold, all lay in a space of ground not exceeding a foot across, and required but a moment's labor for Uncle Dan to take it all in, which he did. This is an extensive placer claim, situated above Hall's gulch, on the bank of the Merced river, and formerly owned and worked by the Cope Bros., many years ago.—*Mariposa Gazette*, Mar. 20th.

**THE NEW SAN PEDRO DISTRICT** bids fair to become one of the greatest feeders to Tucson has yet sprung up. It is looking up, and the recent discoveries of coal in the immediate vicinity have made that region probably the most extraordinary in Arizona.

## Tioga District.

A private letter gives the following information about this district:

I found that Tioga is situated on the western slope of the main range of the Sierra, at the head-waters of the Tunlunne river and Lee Vining creek, the former flowing to the westward and the latter easterly and emptying its waters into Mono Lake. There is certainly the finest bodies of timber I ever saw on the Tunlunne, both as to extent and quality. In fact a supply that would furnish both Tioga and Mill creek for years to come, should either or both camps assume the foremost rank as mining locations on the coast.

The first croppings and prospecting we encountered were at the head of Bloody canyon, on what is called Mt. Gibbs. Here I saw a very interesting formation, but with very little work done. Continuing our course down the Toolunne for five or six miles, we arrived at the Mount Dana cabin on Tioga hill, the original discovery point of this district.

The country rock is of an entirely granitic formation, and seems to have split into two parts, one running almost north by the way of Mt. Dana, and the other northwesterly, thus forming an acute triangle in whose southern apex Tioga district is situated. The veins or pay streaks lie between slate, porphyry and syenite, and vary from 10 to 20 ft. in width, in an upthrust of some two to three miles in width by six to eight miles in length, while the veins are clean-cut and well defined. The Mt. Dana shaft, 5½ x 7½ ft. in size, at the time of my visit had attained a depth of 62 ft. The ledge was dipping easterly at an angle of from eight to ten degrees, but I am inclined to the opinion that the dip will change to the west when a sufficient depth has been obtained, as this west granite wall of the mineral belt or range has that inclination. The true walls of the ledge have not been exposed in the Mt. Dana shaft, while at the bottom the vein carries full three and a half ft. of ore assaying, by average sample that I took to San Francisco, from \$80 to \$300 per ton. The ledge lies between

## Slate and Porphyry,

In gangue or vein matter. The croppings on the Mt. Dana, averaging about 15 ft. in width, are well defined the entire length of the location, 1,500 ft., though in places the slate laps over, forming a cap. The Sheep Herder ledge, 20 ft. in width, shows, by three surface cuts, 10 ft. breasts of ore in each cut. Each cut shows six inches of clay gangue on the foot-wall. The average samples I took from this ledge and had assayed at the Bay gave assays averaging about \$80—I have forgotten the exact figures. I also inspected the Beven, Anstis, Tioga Chief and other claims too numerous to mention, and found that but little work had been performed. The ledges are parallel and continuous. Water is abundant and never failing, and in this respect and in the matter of timber the facilities for the economic working of mines and operating mills are unsurpassed anywhere.

The above is a hasty summary of observations made on a flying visit, and includes about all of interest that I can now recollect of Tioga. My present intention is to visit the district again.

## Copper.

Probably there is no metal capable of producing so very many distinct alloys as copper. These different alloys are distinguished as much by their characteristics as by their color. And in the latter case the color may be made to vary from the red of the original copper to the almost blank white of silver. Take the composition of the widely used Babbitt's metal, employed throughout the world as bearings for journals and in places where friction comes. It is nearly pure white, and yet out of 100 parts of tin, antimony and copper, the copper makes one-twenty-fifth, the exact proportions being tin, 89; antimony, 7.3; copper, 3.7.

And there are bronzes used in the arts which have so slight an admixture of lighter colored metals with the copper as scarcely to change the color of the original and basic metal. In iron, the compounds, or changes rather, are so slight that it is a puzzle as yet not entirely solved, to discover and produce the exact change from fibrous wrought iron to crystallized steel. There are mediums between these two extremes, but these are the extremes, and to produce these from the original metal, and to produce any of the grades between, requires a nicety of manipulation and a knowledge of chemistry and metallurgy that it takes years of application and patience to compass.

It seems as though a promising field is before the metal worker in the working of copper and its compounds. The number of metals with which copper will form useful alloys is so great, and the variations in the character of the alloys are so many, that there can be little doubt that there are resources in copper, in its use in the arts, which have not yet been exhausted.—*Maine Mining Journal.*

A SUCCESSFUL MILL.—The Yankee Fork Herald says: The Gen. Custer mill is turning out about \$4,000 a day in bullion, notwithstanding the frequent stoppages and delays caused by some portion of the mill not working properly. From the present workings of the mill we are satisfied that when it is in perfect working order the output of bullion will exceed that of any mill of equal capacity in this Territory.

## USEFUL INFORMATION.

## Salicylic Acid as a Dressing for Textile Fabrics.

The field for the utilization of salicylic acid is rapidly being widened. Experiments recently made in England show that raw wool washed in a solution of this acid, one part; soft soap, 500 parts; water, 2,000 parts, did not show the least sign of mildew after being stored for a considerable period. Yarns intended for storing were successfully treated in the following way: In greasing them during the process of carding, one part of salicylic acid was added to 500 parts of grease or oil which was used. This small quantity of salicylic acid entirely prevented any signs of deterioration by age, and entirely takes away that offensive smell of rancid oil so often observable. Woolen cloth, when treated in the last wet process with a solution of one part salicylic acid to 500 parts of water, retained its gloss much longer than by any other process hitherto employed.

In finishing cotton goods salicylic acid was added in the proportion of from one to four ounces for every hundred pounds of material being finished, and the goods thus treated were preserved free from mildew or decomposition, even with a prolonged storage. Warp which had been kept for a long time upon this spindle was kept fresh and sound when subjected to the same treatment. The addition of from one to four ounces of salicylic acid to five gallons of finishing material will be found an infallible agent for warding off an attack of mildew from cotton textile goods as well as preventing the unpleasant smells they are so liable to. While not indispensably necessary to goods which are disposed of soon after their manufacture, the addition of salicylic acid to the finishing material will be found to have great favor with the public from the fact that goods keep their original appearance, don't mildew, and do not take on a bad odor when being kept in stock or shipped on a long journey.

DIAMOND INK FOR WRITING ON GLASS.—A mixture for writing on glass has lately been put on the market, under the name of "diamond ink," which is pronounced to be a very useful article for druggists and others for labelling bottles containing substances which would destroy ordinary labels. It has been examined, and found to consist of a mixture of ammonium fluoride, barium sulphate and sulphuric acid; the proportions of its manufacture being, barium sulphate, 3 parts; ammonium fluoride, 1 part; and sulphuric acid enough to decompose the fluoride and make a mixture of semi-fluid consistency. This mixture when brought in contact with a glass surface with a common pen, at once etches a rough surface on the parts it comes in contact with. The philosophy of the action is the decomposition of the ammonium fluoride by the acid, which disengages hydrofluoric acid, which attacks the glass; the barium sulphate is inert and is simply used to prevent the spreading of the markings. The mixture must be kept in bottles coated on the inside with paraffine or wax.

HOW TO GRIND A GLASS PLATE.—It is sometimes useful to know how to impart a finely-ground surface to glass suitable, say, for a focusing screen. Mr. C. S. de Joux, good-naturedly sends us, all the way from Mauritius, a simple method he has practiced, which certainly deserves to be recorded. Finely-ground sand or river mud—or, what is better still, the sediment from a grindstone—is well stirred up in a bowl of water, and after a few minutes the upper half of the liquid decanted off. The decanted liquid contains all the finer particles, and these, after subsiding, are collected in a watch glass. The sheet of glass is laid on a damp cloth spread upon a table, and the watch glass and mud used as a muller, the convex side of the watch glass supplying a good hold for the fingers. In a quarter of an hour a satin-like polish will be obtained, admirably adapted for focusing. A rinse with water will show if the grinding has been uniform.—*Photo News.*

COPYING DRAWINGS.—By a method patented by M. Joltrain, of Paris, it is claimed that copies of drawings having nearly black strokes on a white ground can be made by the following sensitizing mixture: Gum, 25 grammes; chloride of sodium, 3 grammes; perchloride of iron at 45° B., 10 cubic centimeters; sulphate of peroxide of iron, 5 grammes; tartaric acid, 4 grammes; water to fill up to 100 cubic centimeters. The developing bath may be a solution of ferrocyanide of potassium, red or yellow, acid or alkaline. The printing is done in the ordinary way, and the developing in a bath of red or yellow prussiate of potash. After washing, the proof is put into an acidulated bath, which darkens the lines to an indigo tint, and is then again washed and dried.

HARDENING STEEL.—A Sheffield paper says: A very fine preparation for making steel very hard is composed of wheat flour, salt and water, using, say, two teaspoonfuls of water, one-half a teaspoonful of flour and one of salt. Heat the steel to be hardened enough to coat in with the paste by immersing it in the composition, after which heat it to a cherry red and plunge it into soft water. If properly done, the steel will come out with a beautiful white surface. It is said that Stubb's files are hardened in this manner.

PLATINUM WORKING.—The only platinum worker in the United States is Joaquin Bishop, of Sugartown, Pa. At the time of its recent meeting in Philadelphia, the Association of Mining Engineers made an excursion to the works of Mr. Bishop to see his working of the intractable metal. Mr. Bishop, who gets most of his supply of metal from the Ural mountains in Russia, has been working platinum for 40 years. In 1845 he took a premium, but at that time the demand for platinum was so small that it only occupied him one day in the month, using the metal principally for rivets to fasten artificial teeth. Before the engineers, Mr. Bishop melted a piece of platinum with the ease that a plumber melts lead. The intense heat used may be imagined when it is known that a steel file held in the blast burned like a piece of wood. The Russian government used platinum in its coinage until 1864, when about \$2,500,000 worth of platinum coins had been struck.

THE CEMENTATION PROCESS.—A new theory of the conversion of bar iron into steel by the cementation process has been advanced by Mr. R. S. Marsden. He attributes the result to the diffusion of the carbon in the condition of an impalpable powder into the heated iron, and he believes that silicon can diffuse itself in a similar way through iron. This action of the carbon in iron is analogous to the penetration of a red-hot porcelain crucible by carbon, a phenomenon which was observed and commented upon by the author some time ago.

PHOTOGRAPHING MUSIC.—An English paper tells of a gentleman, who, on being asked to sing, produced from his pocket a little case which contained his music, photographed down to the size of note paper. He had duplicate copies of the song, and handed one to the accompanist, singing from the other himself. The expedient saved all the bother of bringing a roll of music, unfolding it, collecting it again, and so forth.

A CHILD'S dress made of flint glass and trimmed with lace made of the same material will soon be exhibited in a show window in Pittsburgh. It is now at one of the trimming establishments, and is nearly completed. The dress glistens like the finest satin, and is marvelously beautiful. The fabric from which it is being fashioned was spun and woven at the glass factory of Messrs. Atterbury & Co., Pittsburgh.

IMITATION ROSEWOOD.—Boil one-half pound of logwood in three pints of water till it is very dark red; add one-half ounce of salt of tartar. Stain the work with the liquor while it is boiling hot, giving three coats; then with a painter's graining brush, form streaks with the following liquor: Boil one-half pound of logwood chips in two quarts of water; add one ounce of pearl ash, and apply hot.

## GOOD HEALTH.

## Brain Work and Sleep.

So long as the brain worker is able to sleep well, to eat well and to take a fair proportion of outdoor exercise, it is not necessary to impose any special limit on the actual number of hours he devotes to his labors. But when what is generally known as worry steps in to complicate matters, when cares connected with family arrangements, or with these numerous personal details which we can seldom escape, intervene, or when the daily occupation of life is in itself a fertile source of anxiety, then we find one or other of these three safeguards broken down. Probably the man of business or the successful lawyer fails to free himself from his anxieties at night, and slumber becomes fitful or disturbed. The nervous system, unsettled by the mental strain, brings about various defects in nutrition; the appetite fails, and then we meet with the sleeplessness, the dyspepsia, the irresolution, the irritability and the depression which are the chief miseries of the overworked.

The great thing in these cases is to get a rest at any cost. By rest we do not mean doing nothing, but rather change of scene, of thought and occupation. If you tell a busy man that he must do nothing, he may endeavor to obey you, but he will soon find out that he cannot, for his brain keeps on working in the same old groove, and he is as much, or even more, worried about his business as if he were still in the thick of it. The great thing is to get rest by substituting one kind of work for another, to have for a time a nice, comfortable sort of occupation to replace the old weary round of troubles. One of the most important remedial agents is outdoor life and exercise, which may be taken in any form most congenial to the individual—riding, walking, field sports, or what not. This is at once the most natural and often the most effectual promoter of sleep we can employ.

Active bodily exertion is well known to be incompatible with the maximum of intellectual work, and full advantage should be taken of this fact. The only thing to avoid is excessive fatigue. It is a remarkable fact that a very large number of distinguished literary and scientific men have suffered severely from the malady by the adoption of some simple hygienic measure. One, for instance, cured himself by

following the prescription of a farrier, who advised him to drink water, eat little and take exercise. Another was cured by drinking every day a large quantity of fresh water, and exchanging a highly nutritious regimen for a much lighter dietary. A third got rid of his old enemy by the same means, and by taking exercise every day before dinner. There can be no doubt that in many cases great benefit would be derived from a thorough change of locality or climate. Long sea voyages are not unfrequently attended with excellent results, the attacks being absent for months at a time. Unfortunately these are remedies not within the reach of all.

RATTLESNARE POISON.—One of the saddest sights we ever saw was that of a man, aged about 55 years, who stopped at the Ksandal House, in Evergreen, last Saturday night. On the 10th day of last August, about noon, while herding cattle on the Texas plains, he fell asleep, and while in this condition he was bitten on the left arm, just above the wrist, by a rattlesnake. He was at the time a great way from any town or village, and by this time he reached a physician the poison had permeated his entire system. From that very moment he began to die, and to look at him you can at once see that upon him the "King of Terrors" has already set his seal and has only granted him a respite for a while; but the days of that respite are full of torture, and no doubt the poor, unhappy victim lugs for the end to come. Last Saturday night he was suffering indescribable torture. In his agony he called upon the Great God and upon feeble man to give him relief, but not a moment was he free from pain that was so terrible that language cannot describe it. His body is now full of the most loathsome sores, from which the poison continues to exude. His death is only a question of time, and when it does come it will be to him a happy riddance from suffering. *Conevah (Ala) Star.*

SINGULAR EFFECTS OF NITRO-GLYCERINE.—A foreign journal mentions the case of a lady suffering with cramps in the stomach, and to whom something less than a drop of one per cent alcoholic solution of nitro-glycerine was given. In two minutes the pulse fell from 140 to 50, a clammy sweat covered the patient's features, and she became senseless. Stimulants to the nose, and brandy, were quickly given, and in about three minutes more she began to recover—the pain was completely gone, and did not return all that night or the following day. The patient said she felt like two persons, and so strong was this impression, that though perfectly rational in her conversation and unexcited in her manner, she could not shake it off.

BREATHES THROUGH HIS EARS.—A barber in Altona announces his ability to live 10 hours with his nose and mouth hermetically sealed. Those acquainted with him see no reason why he should not be able to accomplish what he claims, for he is able to breathe for a time without the use of mouth or nostrils, communication between his lungs and the outside world being kept up through his ears. When smoking a cigar he often exhales the smoke through the same extraordinary channel, to the profound astonishment of those who are unaware of this freak of nature.

MUSIC IN DISKASE.—Dr. Oscar Jennings, a physician of standing in Paris, writes to the *London Lancet*, that in the treatment of mental disease he has constantly used music, which calms and soothes the mind, and declares it to be too precious an agent to be neglected. This is both scriptural and poetical indorsement. Saul of Tarsus was cheered by music, and the poet recognizes it as the soothing of the savage breast, while Shakespeare denounces "the who has no music in his soul is fit for stratagem and spoils."

TURN-UP HATS.—In regard to children's hats, reference is made by the *London Lancet*, objecting to the senseless fashion of turning up the brim of the hat in Tyrolean, or Spanish fashion, so that "infants and little folks of tender years have half-closed eyelids, corrugated brows, and faces screwed up by the glare of the sunshine, from which the brim of the hat, if correctly used, ought to protect them."

COPYING FROM THE MICROSCOPE.—Dr. Baale gives the following as the simplest method of copying an object magnified in the microscope: Arrange the paper on a piece of stiff cardboard, so that it may be upon the same level as the stage upon which the object is situated, on the left side, if the right eye is the one used for observation. If we now look steadily at the object with the right eye, it will be found that the object appears to be thrown, as it were, upon the paper, and it may be clearly seen by the left, and its outline be very readily traced, the movements of the pencil being executed by the right hand, if the observer is not able to use the left. By far the best course, however, is for the observer to acquire the habit of observing with the left eye, in which case the paper can be placed on the right hand of the stage, and the right hand used for drawing. With a little practice the relative position and correct size of objects may be insured in this manner.

LONDON capitalists received \$1,875 from the Oregon hydraulic mine of Oregon, last year, being at the rate of 62½ cents per share on 3,000 preferred shares.

Wire-Bound Asbestos Boiler Covering, S. F.

#### The Week.

There is not much new to record in mining matters other than what our summary gives. Many miners in different parts of this State, Nevada and Utah are getting ready to go to the Wood River country, Idaho. It is too cold up there yet for men to travel much. We have just been reading of a trip there, in which we see the following statement:

They struck snow 14 miles this side of the Cottonwoods, left their wagon box eo as to lighten up as much as possible, and traveled nights from 3 o'clock in the morning until the sun got up and softened the snow. It was very slow work. They had to dig through the snow from three to four feet and clean off a place for a camping ground, and then dig away snow and cut sage brush and build a fire and sit around it all night to keep warm.

Provisions of all kinds are scarce in Bellevue, and command high prices. The stage goes loaded every day, and men are going in on foot by the dozen every day, and without either grub or money. Tregaskie said he had to feed every man that he met. There is no sense in starting for the mines for three or four weeks. He has been in the mountains all his life, and had many a hard trip, but this was the toughest trip he ever experienced.

The Legislature convened in extra session on Monday, being given 20 days to do up the work which should have been done at the regular session. Thus far there has been much talk and little actual work. In Congress there has been much talk, also, and the Senate is at a deadlock between the two leading parties, and can neither organize or do anything else. Both sides are unyielding, and threaten to sit their time out before giving up the points they contend for. The only consolation the country can get out of the situation is that the Senators might be doing something much worse than fighting each other with words.

#### Mining Experts' Reports.

Ons De Kay has brought suit against Prof. R. W. Raymond to recover \$21,000. He alleges that Prof. Raymond's report of the value of the mines of the Chrysolite Mining Co., Leadville, Colorado, was false in its statements, and he was deceived by it into investing money in the Chrysolite stock. Prof. Raymond testified that after he arrived in Colorado, he received a commission to examine the Chrysolite mine. He walked about 4,000 ft. in the mine, and based his estimates on what he noted. He wrote his report on the night of the day he made the examination, and received \$5,000 for it. He estimated that the company owned about 108,000 tons of silver ore, worth, at the smelter's price, about \$7,000,000. Raymond said he felt justified in congratulating the company upon the "possession of a bonanza."

This suit is likely to decide a very important question, which is, whether experts can be held liable for statements in their reports. The decision may, therefore, excise a great moral influence.

If it is held that experts may be held liable, then we must have a legal definition of an expert. Does any body know what one is? The term is a very indefinite one, and of late has fallen into disrepute in this part of the world, like the title of "Professor," which is honorary elsewhere, but here only considered so when applied to educators. Charlatans have taken unto themselves the title of professor, and the same class have adopted the "mining expert" title. Seven-eighths of the people here who travel around as mining experts have no right whatever to be considered so, other than that they are expert enough to make a living out of mines without owning any, without working in any, and without knowing anything about them.

Because a man can go to a mine and write up a description and report about it, which is intended to sell the property, it is no proof he is an expert. In fact, most of the reports gotten up to sell mines are not by experts. Men with real knowledge on these subjects, and above reproach in character, are not in demand here. It is the class who will report favorably on anything, who get most of the business of experting; and for this reason is it that "mining expert" has become a term not greatly desired by men of position. The real mining engineer, educated as such, is satisfied with his title as he earned it.

But if the suit to which we allude is decided so that experts will be held to their statements, will not this really increase the number of unreliable ones? People cannot well be imprisoned for this kind of thing, and the class of men who will make false reports will not be apt to yield much in pecuniary damages.

Reliable, upright, educated mining engineers, such as should be employed by people with honest intent, are not afraid of being held to their statements. These are not made carelessly or without thought and study. At the same time mining engineers, no matter how highly educated or experienced, are liable to errors of judgment like other people. In making their examinations they may be more or less influenced by the desire of those by whom they are employed, and this perhaps unconsciously, and it by no means follows that because a mine turns out better or worse than might be anticipated from the report there has been any intention to deceive. In Prof. Raymond's case, the only matter of surprise to us is that he examined the mine and wrote the report the same day. The gentleman's reputation has not been such that people who know him will believe he deliberately made a false report. It is much more probable the statement made was an error in judgment, the conclusion reached being based on conditions which were not what he supposed them.

THE MILL AT PIKE CITY, Sierra county, has shut down after having made a very satisfactory run of 32 days. The shutting down, however, a correspondent writes us, is for the purpose of adding another 10-stamp battery to the new mill, which will be put in immediately, and he completed by the time the pumping machinery clears the shaft of water, and the necessary work of timbering is finished. All of this will take three or four weeks, when the mill will start up again.

THE SUTRO TUNNEL AT SUTRO.—The people of the town of Sutro are on the "ragged edge" as to the ownership of the tunnel. The *Enterprise* says they reason that if the bonanza people have secured control of it the fact shows confidence in the future of the Comstock and means something for the tunnel besides a mere drainage proposition. They think it indicates high concentration and reduction works at or near them and renewed life for their town. Such works as would be required there would give steady employment to a great number of men.

LOST THEIR BIT.—The head of the diamond drill has been broken off in No. 2 drill hole from the bottom of the Ophir-Mexican mine on the 2700 level. When a hole becomes 200 to 300 ft. in length there is a great strain on the stem of the drill, and it is liable to twist in two. The drill head will be recovered when the hole is followed up with a drift; meantime, another bit can be employed in a new direction.

#### Commissions on Sale of Mines.

A suit was decided in this city this week by the Supreme Court, the points in which are of great interest to all mining men, as questions have before this given rise to frequent disputes between the owner and the broker or seller of mining property. The case was that of Dolan vs. Scanlan, and arose out of an action to recover certain commissions which it is claimed the defendant agreed to pay to the plaintiff for selling certain mining property.

The complaint alleges that the defendant was the owner of a mine in Mariposa county, called the Golden Virgin mine; that he employed the plaintiff to sell it for him; that he agreed to pay plaintiff for his services, in making a sale, the sum of \$5,000; and that the plaintiff did, in pursuance of his employment, on the 20th day of May, 1877, negotiate and complete a sale of the mine to one C. W. Thomas for \$20,000; yet the defendant refuses to pay him his commissions therefor.

The allegations of the complaint are denied by the answer. The court below gave judgment in favor of the plaintiff. Defendant moved for a new trial, on the grounds, among others: "Insufficiency of the evidence to justify the decision of the court; and the same is against law. The evidence being insufficient in this:

"(a) That it failed entirely to show or establish any contract whatever between the plaintiff and the defendant.

"(b) That said evidence failed to show that plaintiff found a purchaser for said mine.

"(c) That the evidence does show that the defendant himself procured the purchaser, and actually sold the mine himself, unaided and unassisted by the plaintiff."

The motion for a new trial was denied, and from the order and judgment the defendant appealed.

This in brief is the statement of the case. Judge McKee, in deciding it, says:

To recover in an action for brokerage or commissions for a sale of real property, two things are necessary to be established: First—That the plaintiff was employed to make the sale. Second—That in pursuance of his employment he found a purchaser in a situation ready and willing to complete the purchase on terms agreed upon.

It appears by the record that in the year 1876 the defendant was engaged in opening the mine referred to, and, at the same time, trying to sell it. While so engaged he availed himself of the proffered services of the plaintiff, who resided in San Francisco, to buy for him certain articles of machinery for a 5-stamp mill, which he was putting up on the mine, and to forward them to him. He had bonded the mine to a party, and others were examining it with the view of purchasing it, but they all failed him; and becoming anxious to sell, as he had not the requisite

#### Means to Develop

It, he wrote to plaintiff on the 16th of January, 1877, as follows:

"What I want means to open the mine properly, or to sell it. \* \* \* Now, I would like you to see it, and you could get a party to buy, so as you could make \$5,000 or \$10,000. I would like you to make it sooner than anyone else. When you answer this I will tell you in my next letter what I will take for the mine. \* \* \* Write soon and let me know if you can get parties to buy. But I reserve the right to sell as soon as I can."

In answer to this letter the plaintiff wrote on the 22d of January, 1877, \* \* \* "If I can, I will go up to see you and probably be able to do something for you. \* \* \* Let me know when you write again how much it will take to put an incline from the tunnel to the mill. Let me know all the particulars, and your lowest price for the mine. You know it will be secret between you and I. I only want to know how to work. I will do my very best for you." On the 14th of March, 1877, defendant wrote again to the plaintiff as follows: "I must sell the mine or part of it. \* \* \* There is fine rock in the level where the vein is solid, but I can't get it without a pump. The mine is a good one, but the opening of it is heavy on me. If you can't get more than \$15,000, let it go and I will give you \$5,000."

These letters evidence a proposal by the defendant and an acceptance by the plaintiff. The acceptance was of the whole of the terms of the proposal; for where one proposes to another a contract, it must be wholly accepted or rejected; it cannot be accepted with a difference of terms. An acceptance must be absolute and identical with the terms of the proposal. When, therefore, the plaintiff accepted the terms contained in the letters of the defendant, the letters constituted a binding executory contract between the parties, by the terms of which the plaintiff engaged himself as a special broker to sell the mine for defendant, with the measure of his brokerage or compensation fixed and agreed upon, reserving to the defendant himself the right to sell.

Within the scope and warrant of the terms of this contract the plaintiff had authority to sell, but

#### This Authority Was Limited

By the right reserved by the defendant. Under this right, the defendant, if he sold the mine, would not be liable to pay the plaintiff commissions; he undertook only to pay for a sale effected through the agency of the plaintiff.

This right existed in the defendant independent of the reservation of it in the contract; for a party who employs a broker to sell real estate, may, notwithstanding, negotiate a sale himself, and if he does so without any agency of this broker, he is not liable to him for commission. To earn his commission the broker must be an efficient agent in, or the procuring cause of the contract.

Now, the mine was actually sold to the person referred to in the pleadings, on or about the 20th of May, 1877, for \$20,000, \$5,000 of which were paid, and the balance was secured by a promissory note, payables in sight months, and the payment thereof secured by a mortgage upon the mine. But the plaintiff did not find the purchaser, nor make the sale, nor assist or co-operate in making it, nor was he the procuring cause of it. The defendant himself negotiated and completed it entirely independent of the plaintiff. It is true that there is some conflict in the testimony upon the subject, but it is not substantial. There is a great preponderance of the evidence in favor of the defendant. The plaintiff himself, in his testimony, says: "I have brought this action for money coming to me for his (the defendant) selling this mine. I expected the money if he sold this mine." He admits that he

#### Never Spoke to the Purchaser

About huying the mine, and that he was wholly unacquainted with the man until introduced to him by the defendant after this mine had been sold. "I knew Thomas," he says, "but was not acquainted with him until about the 12th or 14th of May, or along about there, when I had an introduction to him." Nor did he ever attempt to see him about purchasing, although he was well aware of the fact that the defendant had been, for several months, trying to negotiate with Thomas for a sale.

He says: "I did not go down to see Thomas to push this trade, because I thought I had other better parties than Mr. Thomas at this time—men who would give more." And he never claimed that he had anything whatever to do with the sale until after it had been negotiated and closed by defendant. After that he claimed that he had found Thomas as a purchaser, because he had written to the defendant to come down to the city and sell the mine to anyone who would buy. To this question, namely: "And you claim that you discovered Mr. Thomas as a purchaser of the mine; that it was through your efforts?"—he answered: "On the last, when a negotiation was made and the purchase closed, I claim that I did. I claim that I wrote for the defendant to come down to close the sale of this mine with any man that would give us the best terms." On the 1st of May he had written to the defendant that he had sold the mine, or was in a fair way to sell it, to a New York company for \$30,000, and he wrote: "You will either have to come down or send me a power of attorney when I notify you." But on the 14th of May he wrote again to the effect that nothing could be done: "You must come right away, and if we cannot sell it we will borrow some money upon it. \* \* \* I do not see any other thing for you to do than to come down to the city to make some arrangement, for I have no authority to do anything."

The Efforts to Sell to a New York Company Were made on the plaintiff's behalf by one with whom he had promised to divide his commission in case he effected a sale. But he said to him at the same time, "If we do not sell within a day or two or get some one interested in the property to examine it, Scanlan, (the defendant) will sell it to Mr. Thomas, and there is no commission in it for us."

The defendant, after these letters, came down to San Francisco, and finding that plaintiff had not and could not effect a sale, he resumed negotiations with Thomas and sold the mine to him. In these negotiations the plaintiff did not in any way participate.

Of course, if the plaintiff had found Thomas, as a purchaser, and brought him and the defendant together, or if he had told Thomas that the mine was for sale, and the defendant that Thomas wanted to buy, and if, under these circumstances, the defendant had taken the negotiation of sale into his own hands, and effected a sale, he could not refuse to pay the plaintiff the stipulated commission.

#### The Commission of a Broker is Earned

By finding a sufficient purchaser ready and willing to enter into a valid contract for the purchase upon the terms fixed by the owner, and having introduced such a one to the owner as a purchaser, he is not deprived of his right to commission by the owner negotiating the contract himself. But none of these things were done by the plaintiff.

Unquestionably the plaintiff, personally and jointly with a third party, expended some time and labor in trying to find a purchaser and to negotiate a sale, but his efforts were unsuccessful, and after the sale had been made by the defendant he rendered some services to the defendant by introducing him to a lawyer who supervised the papers of the sale which had been prepared by the attorney of the purchaser. But these services, rendered after the sale, were not "within the encompassment and drift" of the plaintiff's employment and none of the services which were rendered were assistant to this sale. Neither for them, nor for his unsuccessful efforts in finding a purchaser, is the plaintiff entitled to commission. The essence of his contract was the obtaining of a purchaser. The judgment and order of the lower court were reversed.

## California Mines.

We have been constantly calling the attention of miners to the fact that they will find as good mines in California as anywhere, and that, on the principle that the "hills look green afar off," they imagine that Arizona, Idaho or Alaska must be better places for miners than this State. California is producing somewhere about twenty millions of dollars a year from her mines. Although the first opened of the Pacific States and Territories, she is even yet second only in the list of bullion producers. Colorado for the first time eclipsed her last year. These are facts, which speak volumes for the California mines. Dozens of new camps are heralded abroad as going to produce millions, but the end of the year will tell the story.

If we had believed all the "yarns" we read last year about the various mining districts of Arizona, New Mexico and Colorado, and the comparisons which were made between them and "poor old California," we would have been convinced that any one of these camps would have produced more bullion than all Californian districts put together. But "coin talks," and at the end of the year California took its old place as second on the list, and showed an increase of over half a million production over the previous year. And this was done without any rush, or excitement, or extended advertising, or new railroads; and, in fact, in the face of adverse circumstances, a great deal of capital being invested elsewhere in newer regions, while comparatively little was put in here.

California can very well afford to move on her way quietly, open her new mines, and develop her old ones, take out the gold and turn it into "twenty's," and at the end of the year she can count dollars with some of the newer regions, about which there is more talk than corresponding results.

It is just as well for miners to think twice before going off on wild goose chases. They may find that what they are leaving at home is as good as what they are going after. The Virginia Enterprise of recent date refers to this in the following paragraph:

"Recently quite a number of nuggets of gold have been picked up in Butte county, California; were exposed on the surface of the ground by the action of heavy rains and high water. Had those nuggets been thus picked up in Alaska, or somewhere down in New Mexico, what a fever our prospectors would be in till they were off for the region in which they were found. Thus it would seem that even gold is not accorded its full meed of honor at home, when found in its native soil."

The Bodie Free Press has also something to say about California mines, as follows: "The papers published in many of the worked out mining camps of Nevada, are filled with information for their starved out readers as to how to reach Wood River. If energetic prospectors or enterprising capitalists desire to reach the richest and most continuously extensive mining region in America, let them take the stage or other conveyance at Carson City and keep going south till they get well into the mountains of Esmeralda county, Nev., or into Mono or Inyo counties in California. If they are in search of mines rich in gold and silver let them come to Aurora, Bodie, Jordan or Tioga; if they want mines rich in free gold, let them come to Bodie, or proceed to Homer, Beveridge, or other districts in Inyo, and if they want to find mines that are far richer in argentiferous and auriferous galena than anything yet shown in the Wood River country, let them go to Tarrytown and other districts in the vicinity of Deep Springs valley, a few miles south of Bodie."

**HIGH EXPLOSIVES.**—In this issue of the PRESS is given the first of a series of articles on "High Explosives," by E. M. Eiseler. These articles will be of interest not only to "powder men," but to miners. The subject is one which invites discussion, and those who differ with Mr. Eiseler's views are at liberty to present their objections to the same audience that he has. We shall be pleased to give space to a free discussion of the subject for the benefit of all concerned, so if any one has any thing to say which will add interest to the subject of "high explosives," we are ready to hear from him. The subject is one which only those persons who have made it a study can be familiar with, and the editors of this journal cannot undertake to endorse the statements of the various writers; but we will give all a fair opportunity for criticism or explanation, and hope all will contribute their quota of knowledge.

The first iron bridge built in Idaho has just been completed across Snake river at Blackfoot. It is composed of five spans, each 100 ft. in length, while on the east side is about 60 ft. of approach built of timber, and on the west side about 25 ft., making the entire bridge 585 ft. in length. There are six piers or cribs, which are built of heavy timbers 12 inches square and filled with rock, over 100 cords of rock being used for that purpose, the weight of the cribs being estimated at 75 to 125 tons each, besides the weight of the bridge.

## Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last. Vice President, J. P. Moore, in the chair.

Among donations to the museum was the corugated tooth of a hairy mammoth found among fossil remains on the southwest shore of Whidby island, Washington Territory, by Capt. J. S. Lawson, of the United States Coast Survey. There was also presented, by S. Ferraro, a sting-ray fish, about three inches in length, whose sting is very severe; by Dr. Arthur B. Stout, a Mexican water-bottle, manufactured of colored pottery with interesting figures, from the State of Jalisco; from Dr. H. Herman Behr, a species of *geophilus*, or centipede, found in Sonoma county, which, it is surmised, feeds on the phylloxera, and is thus a friend to vinticulturists; from W. H. J. Brooks, a large rat with a pouch on the side of his face, like those of gophers, and a bat from Bakersfield; from Captain Lund, a crab from Tahiti; from J. H. Clark, a variety of California wood-rat; from the Smithsonian Institute, a donation of 129 species of Pacific coast fishes; from Capt. R. W. Simpson, a spirally

## Metallurgy of Copper.

A metallurgical process of apparent importance to copper miners has been made by some manufacturers of Saint Etienne and Lyons, France. Everybody knows of the revolution effected in steel making by the Bessemer process. "Blow air into pig iron;" such was the original idea of that invention. That idea has been generalized. Some time ago, in England, it was tried to blow air into molten pyrites, or sulphides of copper, so that the sulphur could be got rid of and at the same time be used as a combustible. But, as it happened to Sir Henry Bessemer in the beginning, it was impossible to prevent the cooling of the bath at the end of the operation. Only by a mere accident a practical way has now been found to overcome this great obstacle.

A French correspondent of *Iron* describes this discovery as follows: Recently some old scraps of copper were to be melted in a copper foundry at Lyons. It happened that a small piece of phosphor-bronze was amongst them. The engineer present at the operation was much astonished when he noticed this particular piece of scrap becoming heated, under the influences

THE ROLLER ORE-FEEDER.

knotted cane of Port Orford cedar, with an enormous head composed of tuber excrescences that grow at its roots, the whole varnished and inscribed with a silver plate.

James V. Coleman and Joseph Grant were unanimously elected members of the Academy, and L. E. Blockman was proposed for resident membership.

A paper was then read, prepared by Captain De Bruno, of the Italian army, a gentleman who has been widely engaged in collecting archaeological specimens in the South Pacific islands, especially in New Guinea. Captain Bruno has unpacked a large archaeological and ethnological collection, and they were displayed at the hall of the Academy, where all parties especially interested are cordially invited to inspect them. His paper was in narrative form. Capt. De Bruno announced his intention of completing the reading of his very interesting paper at the next meeting of the Academy, on the 18th instant.

Vice-President J. P. Moore read a translation of Max Cornu's paper on applications of the germ theory to parasitic fungi and especially to diseases of the vine.

Dr. H. W. Harkness then presented a printed list describing 29 new kinds of Californian fungi, just published in London, as the result of his labors, and those of his associate, Mr. Cooke. The Vice-President said the work Dr. Harkness was so earnestly and faithfully carrying on, in discovering and classifying the fungi of this State injurious to vegetation, was a very laborious one, requiring all his time, which he cheerfully gives, with hard study and close scrutiny. It is destined to prove exceedingly valuable, and he is surely deserving of great credit for his skill and industry. Dr. Harkness then described a disastrous fungi that infests oak trees in our park and cemetery, which spreads its network over the oak leaves, producing death by depriving it of air to breathe, for leaves are the lungs of plants. These twigs die the second year when thus covered, and great numbers are now thus affected.

of oxidizing heat, to a far higher temperature than the other scraps, arriving at last at a bright white heat. In short, the phosphorus, by its combustion giving an enormous amount of caloric, melted the copper. By observing the order of combustion of the elements mixed with the pyrites, it was ascertained that the sulphur was consumed first, then some other element, and finally the phosphorus. The question was simply to add a small quantity of phosphorus in order to prolong the operation and obtain in the end good rose-copper. The result has been the formation of a company for treating copper in this way.

## The Roller Ore-Feeder.

We call the attention of our readers and patrons to the subjoined cut of an ore-feeder, one of which can be seen at the machine works of Joshua Hendy, No. 51 Fremont street, in this city. This feeder was patented June 24, 1873, and is called the "Roller" feeder.

Its important feature is that it is a carrier feeder, the ore being carried over a roller to the line of discharge, which is an essential element in the construction of any automatic ore-feeder. The spring attachment and grip, shown in the cut, are the equivalents of those introduced into the well-known Challenge, manufactured at the same works.

The adjustable gate is a check to prevent the ore passing from the hopper too freely over the roller. Those who are interested in the important matter of the proper feeding of ores to secure their perfect reduction are invited to examine the one in operation at the Machine Works, No. 51 Fremont street.

DURING the past few weeks rich strikes of carbonate ore have been made in the Cave Creek district, Arizona, which will yield as high as \$150 to the ton, and specimens have assayed as high as \$300.

## A New Home Industry.

The San Francisco Tool Co., of this city, a newly organized company, of whose products we expect to treat in future numbers of this journal, has commenced the manufacture of centrifugal pumps for low lifts, and especially adapted for purposes of irrigation and reclamation. These pumps are in many respects novel, as we shall presently explain, and their manufacture adds one more important item to our local industries.

During ten years past, especially since the improvements of the Gwynne's, of London, England, pumps of this class have been constantly gaining in economy of performance and in favor, until, at this time, it may be said that ecop wheels, Archimedesian screws, bucket chains and so on, have been abandoned and laid aside as crude and unreliable. This remark applies even to conservators Holland, where nearly all recently constructed pumping plants have consisted of centrifugal machines.

The most extensive experiment in low lift pumping thus far has been that of clearing the Ferrara marshes in northern Italy, where a marsh district of 200 square miles has been cleared of water and successfully maintained for cultivation. The amount of water raised almost surpasses comprehension, sometimes reaching 500,000 gallons a minute. If flowing in a stream at the rate of two miles an hour it would equal 100 ft. wide and 4 ft. deep.

The most astonishing matter, however, in connection with this vast and successful enterprise is the coefficient of effect. In the official trials in 1875, the fuel consumed was 4 lbs. for each horse power of water lifted. The pumps have now been in use seven years, and all that time have cost nothing except for fuel, oil, and attendance.

In Holland, there have been erected many large plants of a similar kind, some of them very extensive, and in all cases with an economy over the old primitive appliances, which "theoretically," "lost no power."

The pumps constructed by the San Francisco Tool Company are called Turbine, and the name suggests an analogy between the history of water-raising appliances and water-driven appliances. It is not so long since but that people now living can remember when the overshot water wheel was thought the most perfect among hydraulic motions, and this idea prevailed until Francis and Boyden's hydraulic experiments at Lowell, Mass., showed conclusively that Turbine wheels would and did utilize between 80 and 90% of the total gravity of the water. The Turbine water wheel has since then taken its place as the true scientific water motor for all heads within ordinary range; and centrifugal pumps, for the same reasons, are following in the same line. We are, of course, speaking of low lifts, and in cases where water power and water raising can be fairly compared. For deep lifts and high pressure, modern engineering, and especially California practice, is not likely to be much improved upon.

Land reclamation and irrigation are in the future to form subjects of great interest on this coast, and we venture the opinion that the San Francisco Tool Company have entered upon methods that will well suit the requirements.

Their pumps are called "Turbine," from the analogy to water wheels of that name, and they possess many features in common.

The "runners" are "many issued" and enclosed; are, in fact, Turbine wheels.

Instead of filling the casings as closely as possible, the usual method of constructing such pumps, a space of several inches is left between the sides of the "runners" and casing.

This space is filled with water, as it would be in any case, but the makers contend that the friction is much less when a considerable stratum of water is interposed between the surfaces.

The water-joints at the periphery are so arranged as to withstand grit and obstructions. There are no valves or crooked passages, after passing the foot-valve, which is supplied with and included in the price of each pump.

The parts are all strong and substantial, being nearly twice the weight of such pumps as have been hitherto imported.

All the parts are mounted on massive wooden frames, so as to avoid the necessity of foundations which are always expensive, and sometimes impossible on the tule lands.

The same arrangement permits the pumps to be erected on light, cheap barges, where *terra firma* is not available, and this method, if we mistake not, will be adopted in many cases. A cheap barge, or as it is called east of the mountains, a "flat boat," on which could be mounted a turbine pump, a steam engine and a supply of fuel, could no doubt in many cases be profitably employed in irrigating; serving not only one, but a dozen ranches, moving from one to the other alternately as occasion might require.

The company, in addition to their business of constructing machine tools, propose to make nine sizes of these pumps, the area of discharge and direction being from 25 to 400 inches. In cases where it is preferred the turbine pumps with a steam engine to drive them will be mounted on one frame of wood 30 to 40 ft. long, all being connected so as to avoid erecting foundations, and so on, which often cost more than the machinery itself. The address of the San Francisco Tool Co. is given in our advertising columns.

**JORDAN DISTRICT.**—The Bodie Free Press says: Jordan district lies along the mountains forming the western wall of Mono Lake valley, from the mouth of Mill Creek canyon northward to the old Mono placer diggings, and is distant from Bodie about 15 miles. The mountain, which is a portion of the main range of the Sierra and is contiguous and parallel to the summit, rises precipitously to a great height, while Castle peak, with its snowy cap, rears its conical crown above the clouds in the rear or to the westward. The mineral veins of Jordan district strike north and south along the eastern face of the great wall overlooking Mono valley and lake, crop one above the other from the base to the summit of the mountain, and generally pitch west into the hill. The formation near the base of the range is talcose slate, with decomposed porphyry, quartzite and spar toward the summit. A large creek sweeps along the base of the range, under the mineral belt, for several miles, while above the mountain is crowned with a thick growth of "hull pine," a yellow, brittle pine, and an abundance of smaller timber for fire wood.

**A MILE IN 58 SECONDS.**—The new fast locomotive, No. 10, just turned out at the shops at Altoona, was recently given a trial and did wonders. She was taken to Huntington and then started home. The distance of 34 miles was made in 44 minutes, but there was some time lost by a "green hock." One mile was run in 58 seconds and another in 59 seconds, and throughout the trip the engine behaved very well. It is a tremendous piece of mechanism, and, although finished very plainly, is well proportioned and pretty as a picture. There are many changes from the usual engine in this one. The endeavor has been to put all weight as low down as possible. The whistle is on top of the cab, the engine's reverse lever is worked by steam, and the sand-hox, instead of being near the dome, is in the sheathing covering the driving-wheel. A modoc looks like a pygmy alongside of this monster. It will be kept at Altoona for a few days, and run on regular trains until its capacity is tested.—Harrisburg Telegraph.

The La Plata mining and smelting company of Leadville has declared a dividend of 7½ cents per share, or \$15,000, payable at New York on the 1st. A surplus of \$54,000 will be carried over from this dividend, besides \$100,000 working capital.

LEADVILLE has now a stock exchange. Stocks are listed free, so they will no doubt have a pretty long list.

## Business Directory.

WM. BARTLING. HENRY KIMSALI  
**BARTLING & KIMBALL,**  
**BOOKBINDERS,**  
Paper Rulers & Blank Book Manufacturers  
505 Clay Street, (southwest corner Sansome),  
SAN FRANCISCO

**JOHN A. CHURCH, E. M. PH. D.**  
**MINING ENGINEER,**  
Room 75, 115 Broadway, New York.  
Agent for PADDOCK'S Ore Dressing Machinery.  
Mining Machinery supplied.

**San Francisco Cordage Factory.**  
Established 1856.  
Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.  
Extra sizes and lengths made to order on short notice.

**TUBBS & CO.,**  
611 and 613 Front Street, San Francisco

**Books for Miners and Millmen.**

**KUSTEL'S CONCENTRATION OF ORES** (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequalled by any other published embracing the subjects treated. Post-paid, \$7.50. Printed and sold by Dewey & Co., S. F.

**AARON'S TESTING AND WORKING SILVER ORES.**—Illustrated, 114 pages. 1878. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, \$2. Published and sold by Dewey & Co., S. F.

**COPP'S HANDBOOK OF MINING LAWS.**—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc., 1377. Pocket size, and very handy and convenient for miners. Post-paid, \$1.00. Sold by Dewey & Co., S. F.

A New Edition.

**KUSTEL'S ROASTING OF GOLD AND SILVER ORES** (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. 1880. A valuable and carefully written work. Postpaid, \$3.00. Sold by Dewey & Co., S. F.

## USEFUL BOOKS

Relating to Casting and Founding, Electricity, Electric Light, Engineering, Drawing, Manufacture of Gas, Heat, Indicator Diagram, Link Motion, Mechanics, Screw Cutting, Slide Valve, Steam Boilers, Steam Engines, Steel, Turning, Wire Gauge, Workshop Receipts. Descriptive Catalogue sent prompt on application.

E. & F. N. Spon, 446 Broome St., N. Y.

## MOREY & SPERRY,

MANUFACTURERS OF

## Gold and Silver Grinding and Amalgamating Machinery

**HOWLAND'S PULVERIZER** Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorinating Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Surp. Iron Work complete for Wood Frames, also

**SPERRY'S**  
**WROUGHT IRON FRAME**  
**FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

**MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.**

## THE CALIFORNIA POWDER WORKS.

Sporting, Cannon, Mining, Blasting and

## HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

**No. 1 XX is the Strongest Explosive Known.**

**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

**JOHN F. LOHSE, SEC'Y.**

Office, No. 230 California Street - - San Francisco, Cal.

## LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for New Prices, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

**JAMES LEFFEL & CO., Springfield, Ohio,**  
and 110 Liberty St., N. Y. City.

**PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.**

## COLORADO STATE BUSINESS

—AND—

## MINING DIRECTORY.

Seventh Annual Volume. - - - Over 400 Pages.

The Volume for 1881 will be published in January, enlarged, improved, printed from new type, and accompanied by Blake's New State and Mining Map of Colorado.

Best Advertising Medium for reaching the trade of Colorado.

Terms and sample pages sent on application.

Address

**J. A. BLAKE, PUBLISHER, - - - Denver, Col.**

## STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequalled strength, toughness and durability. An invaluable substitute for forgings or cast-iron requiring three-fold strength. Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc. 15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings. CRANK SHAFTS, SHOES, DIES and GEARING specialties. Circulars and Price Lists free. Address

**CHESTER STEEL CASTING CO.,**

Works, CHESTER, Pa. 407 Liberty St., PHILADELPHIA

## Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

This paper is printed with ink furnished by Chas. Enou Johnson & Co., 509 South 10th St., Philadelphia & 69 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorety, 527 Commercial St., S. F.

## THE IMPROVED INGERSOLL

## Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill well in use on the Comstock.

**GEO. R. FOARD, SOLE AGENT,**  
No. 18, First St., S. F.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

**BY GUIDO KUSTEL,**  
MINING ENGINEER AND METALLURGIST.

**Concentration of Ores** (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

**ROASTING OF GOLD AND SILVER ORES** (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, uplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coln, postage free.

## EXCELSIOR BLASTING POWDER

MANUFACTURED BY THE

Excelsior Powder Company.

This is no so-called "safety" Powder, but a powerful explosive, and as safe to handle and use as any nitro-glycerine Powder on the continent. There is no headache or nausea in the use of this Powder, as the noxious fumes are entirely done away with. It is put up in cartridges of any size to suit consumers and is exploded with cap and fuse, the same as any other high explosive. The following testimonial is a sample of hundreds of the same tenor being constantly received:

GOLD HILL, August 17, 1880.

AGENT EXCELSIOR POWDER CO.—Dear Sir—I have used your Powder in test cement and hard blasting rock, and find it superior to any Powder in use on the Comstock. It does its work effectually, and does not leave the person using it with a severe headache, like the other Powders do to the majority of miners. In recommending it I would suggest, give it a fair trial and I am confident it will speak for itself. Wishing your Company success,  
I am respectfully yours, etc.,

**GEORGE CLARK,**  
Foreman Sierra G. and S. M. Co.

Address all orders to

**Excelsior Powder Company,**  
Room 40, Merchants' Exchange,  
SAN FRANCISCO, CAL.

## New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

tor in building. Apply at the Com-  
pany's office, 314 California street.

## PATENTS AND INVENTIONS.

### List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

FOR WEEK ENDING MARCH 22, 1881.

239,216.—FESSER FOR THRESHING MACHINES.—T. S. Bayley, Orland, Cal.  
239,225.—BSAN CUTTER.—A. Flohr, Sacramento, Cal.  
9,616.—PANTALOONS.—Releuse.—R. Gibbons, S. F.  
239,249.—SULFUR PLOW.—F. A. Hill, San Leandro, Cal.  
239,253.—SPREADER FOR THRESHING.—B. Jackson, S. F.  
239,300.—TREATING ORRS.—A. Ryder, Oakland, Cal.  
239,333.—MONUMENT.—T. Wagner, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

#### Gun Cotton.

[Written for the Press by E. ESSLER, Secretary of Union Powder Co.]

The transformation of cotton fabrics, paper and other forms of cellulose into explosive substances by the action of strong nitric acid was discovered by Pelouse in 1833, but Schonbein (in 1846) was the first to convert cotton wool into the explosive body known as gun cotton. Schonbein found that when ordinary cotton wool, well cleansed and carded, was steeped in a mixture of very strong sulphuric and nitric acids, the result was its transformation (almost without change of appearance) into the curious inflammable material now known as gun cotton. Soon after this discovery many researches were instituted into its nature, preparation by many continental chemists. Experiments were made on its application as a propelling and mining agent, and its manufacture upon a considerable scale was set on foot by Messrs. Hall, the well-known gun powder makers at Faversham, England. Unfortunately, however, a most disastrous explosion occurred at the works, and the manufacture of gun cotton on any considerable scale was consequently abandoned. This was in 1847, and from that time until 1854 little or nothing was added to the knowledge already possessed as to the nature and properties of the material. In that year Mr. Hadow published the results of some valuable experiments, which were as follows:

#### Chemical Constitution.

In the formation of substitution products by the action of nitric acid upon cotton or cellulose, three atoms of the latter appear to enter together into the chemical change, and the number of atoms of hydrogen replaced by peroxide of nitrogen in the triple atom of cellulose,

May be nine, eight, seven or six, according to the degree of concentration of the nitric acid employed. The highest of these substitution products is tri-nitro-cellulose, pyroxyline, or gun cotton.

This was the substance first produced by Pelouse in an impure condition in 1836, by the action of very concentrated nitric acid upon paper or fabrics of cotton or linen, and afterwards obtained in a pure form by Schonbein, who employed a mixture of concentrated nitric acid and sulphuric acids for the treatment of cotton wool; the object of the sulphuric acid being to abstract water of hydration from the nitric acid, and also to prevent the action of the nitric acid from being interfered with by the water which is produced, as the chemical transformation of the cotton into gun cotton proceeds. The formation of tri-nitro-cellulose is represented by the following equation:

The chief objections to gun cotton as first prepared by Schonbein are said to have been: First, its variable composition; second, its looseness of texture, which prevented its having the character of grains of gun powder, so that in its application for propelling purposes, one and the same degree of rapidity of combustion, must exist for every nature of fire arm, whether large or small; third, the dangerous character of its manufacture; fourth, the low temperature of its ignition; and fifth, the corrosive nature of the vapors evolved by it.

These and a few other disadvantages soon led to the abandonment of the manufacture of gun cotton in England, but in Austria experiments continued to be made from time to time, and in the last few years, Gen. Baron von Lenk, of the Austrian army, has succeeded in improving the manufacture of gun cotton to such an extent, that, according to the report of Austrian commissions, it is stated to possess all the advantages of Schonbein's original material without its corresponding defects. It is mainly owing to Baron von Lenk's efforts that gun cotton has taken any rank at all amongst the explosive materials, as without his improvements in the mode of manufacture, this article could never have been produced with any degree of safety or stability.

#### Manufacture.

The following is an outline of the process of manufacture of gun cotton as practiced by Von Lenk: The cotton, in the form of loose yarn of different sizes, made up into banks, is purified

from certain foreign vegetable substances, by treatment for a brief period with a weak solution of potash and subsequent washing. It is then suspended in a well ventilated hot air chamber until all moisture has been expelled, when it is transferred to air-tight boxes or jars, and at once removed to the dipping tank or vessel, where its saturation with the mixed acids is effected. The acids of the specific gravity prescribed by Schonbein are very intimately mixed in a suitable apparatus, in the proportion originally indicated by that chemist, i. e., three parts by weight of sulphuric acid to one of nitric acid. The mixture is always prepared some time before it is required, in order that it may become perfectly cool. The cotton is immersed in a bath of the mixed acids, one skein at a time, and stirred about for a few minutes until it has become thoroughly saturated with the acids; it is then transferred to a shelf in the dipping trough, where it is allowed to drain and slightly pressed to remove any large excess of acid, and is afterwards placed in an earthenware jar provided with a tightly fitting lid (which receives six or eight skeins weighing from two to four ounces each).

The cotton is lightly pressed down in the jar, and if there be not sufficient acid present just to cover the mass, a little more is added; the proportion of acid to be left in contact with the cotton being about 10½ lbs. to 1 lb. of the latter. The charged jars are set aside for 48 hours in a cool place, where, moreover, they are kept surrounded by water, to prevent the occurrence of any elevation of temperature and consequent destructive action of the acids upon the gun cotton. After 48 hours the excess of acid is removed from the gun cotton in a centrifugal machine. The cotton is now thoroughly washed in water, and then immersed in a rapid stream, where it is left for two or three weeks undisturbed.

It is then washed by hand, and immersed for a short time in a dilute boiling solution of potash. It is once more returned to the stream for a few days, then washed by hand, and finally dried by exposure to the air at a temperature of about 80° Fahrenheit. Mr. Abel has recently communicated to the Royal Society the results of very extensive and numerous experiments with gun cotton prepared at Waltham Abbey, at Stowmarket and in Austria, the results of which have fully established the character of gun cotton, when manufactured according to Von Lenk's process, and have explained the reasons why conflicting results were furnished by the earlier products of manufacture. He has, moreover, pointed out one or two very simple measures, the adoption of which he says insure the preservation with perfect safety of reserve stores of gun cotton. The weight of gun cotton required to produce equal effect either in heavy ordnance or in small arms, is to the weight of gunpowder in the proportion of one to three; so it seems that for equal weights, gun cotton would exert three times the force as compared with gunpowder; but regarding its cost of manufacture, it must be at least five times as high as gunpowder.

The general properties of gun cotton as an explosive agent are as follows: When raised to a temperature varying between 270° and 400° F., it burns with a bright flash and large body of flame unaccompanied by smoke, and leaves no appreciable residue. It is far more readily ignited by percussion than gunpowder. The products of its combustion in air render litmus paper powerfully; they contain a considerable proportion of nitric peroxide, and act rapidly and corrosively upon iron and gun metal. Its explosion in the loose carded condition resembles that of the fulminates in its violence and instantaneous character. In a confined space the effects of its explosion are highly destructive as compared with gunpowder, being as one to three, but strange to say the projectile force exerted by it in arms is comparatively small. Mechanical means have, therefore, to be resorted to for the purpose of modifying the rapidity of its decomposition, and it is with this object in view that Von Lenk manufactures the cotton into yarn of different sizes previous to its conversion into gun cotton. By winding, plaiting or twisting into rope these threads, or yarns, of gun cotton, he has to some extent succeeded in effecting modifications in the explosive effects of the material; but experiments instituted by the committee on gun cotton have shown that these modifications of the mechanical conditions of gun cotton do not serve to modify the rapidity of its explosion when under considerable pressure, as in the bore of a gun, sufficiently to reduce the action of the material to that of a safe propelling agent. Much more promising results have been obtained with a different system of mechanical treatment, which has been recently devised by Mr. Abel, and consists in reducing the gun cotton to fine pulp, by ordinary paper-making machinery (Hollander), and then converting it by pressure into uniform masses, the form, extent of surfaces exposed and density of which may be greatly varied.

This mode of working gun cotton affords the means of moderating its explosive action in other ways, namely, by intimately mixing the finely-divided gun cotton either with ordinary cotton, or other oxidizing salts, nitrate of potash, nitrate of barite, the latter composition known as tonite powder. Gun cotton and its mixtures are used to some extent in England, both for mining and sporting purposes, and is manufactured at Stowmarket.

Gun cotton would no doubt have played an important role in our mining industries had it not been for the discovery of nitro-glycerine, the properties of this substance being by far

superior to gun cotton when made into nitro-glycerine powders, called dynamite, which material, owing to its cheapness, superior strength and other advantages, has taken the first rank as a blasting agent, and wherever the question arose, gun cotton or nitro-glycerine powder? the preference was given to the latter.

#### Facts about Ore-Feeders.

EDITORS PRESS:—Since the publication in your issue of the 19th ult. of a communication from me relating to the adoption by Messrs. Parke & Lacy of the Climax ore-feeders, manufactured by Goss & Adams, of this city, as a part of the complement of the machinery and appliances of the so-called model silver mill, then being forwarded by them to Mexico for the North Mexico mining company; I have gathered certain credible information in regard to the adaptability of these feeders to the performance of their required work, which may be of interest to those of your readers who are engaged in mining enterprises, and contemplate the erection of quartz mills.

I have a written statement authorized by a gentleman who has had charge of two mining properties in Shasta county, viz.: the Extra and the After Thought; and also of one in Placer county, the Julian, in the mills belonging to which were eight of the well-known Challenge ore-feeders, and of which this gentleman writes "that they gave perfect satisfaction, resembling a thinking machine." He subsequently assumed the management of the Yosemite mining company, of Mariposa county, in the 30-stamp mill belonging to which were six of the Climax feeders, and of which he says "that after a fair run and trial of their capacity, they were rejected as utterly useless," and recommended their replacement by the Challenge; his experience having taught him that they (the Challenge) are superior, in every particular, to all others. From another gentleman, the manager of the Harmon gold and silver mining company of Placer county, I further learn that in the construction of the mill for the reduction of the ores from this company's mine, that two of the Climax feeders were introduced, and that the machinery not running satisfactorily he employed one of the best millwrights in the State to overhaul it, and that this millwright endeavored, by every mechanical means known to him, to make these feeders do their proper amount of work, but after a series of trials he became discouraged and they were rejected, being unfit to perform their intended purposes; and the manager offers \$100 to any person who will put through one of those feeders (Climax) one ton of rock in a satisfactory, automatic ore-feeding manner.

I have been further informed that two of these feeders were fitted in the Oro Blanco mill of southwestern Arizona, but after a long and tedious trial of them, they were found to do their work very unsatisfactorily, and were pronounced incompetent to perform their required service.

These instances, the truth of which can be verified, it seems to me should be sufficient to cause those who intend to engage in mining, and contemplate the erection of mills adapted to the treatment of gold and silver ores, to hesitate before purchasing feeders of such an unfit pattern as these have proved to be; and I can conceive that their only recommendation is their "low price," which, in the instances given above, has ultimately resulted in being a "very high price," and to this fact alone can I attribute their introduction by mill contractors into any mill, as their adoption is certain to entail not only considerable expense, but important loss of time in experimenting with a thing which will ultimately have to be consigned to the "old iron" pile.

R. B. NOYES.

San Francisco, April 6, 1881.

EXPERTS AND PROSPECTORS.—Sam Curtis has been experiencing some old things in the way of lying by prospecting chaps. He complained to the *Enterprise* recently that he had been bilked into a trip to the Walker river country. A mine there had been bonded by a prospector to San Francisco men. According to the man's story, he had on his dump 1,000 tons of ore that would assay \$80 per ton, an immense lode and plenty of the same kind of ore in sight in all directions. The fellow stuck to this story all the way up from San Francisco and out to the mine. Even when at the terminus of the Carson and Colorado railroad, he assured the Colonel that the mine was all right. "Indeed," said he, "it is 50% better than I have represented it." When the mine was finally reached the ore on the dump did not amount to three wheelbarrow loads. The vein had been cut through and showed nothing, and no such work was to be seen as described. Col. Oshtion made a wild-goose chase out into the eastern part of the State. He told his man in the start that he hoped he was giving a truthful account of his mine; that it would be useless for him to lie about it and cause him to spend time and money in going to inspect his property. The fellow stoutly asserted that all he had said was true and not the half had yet been told, yet he found about such a mine as did Col. Curtis. If prospectors expect to get credit for what they really have, they should give a fair and square account of their property.

#### News in Brief.

THE electric light has been tried with success in London.

A CARLOAD of asparagus has been shipped to Chicago from Sacramento.

THE Spanish papers warn the Mexicans that they will soon be Americanized.

THE British revenue returns show an increase of \$2,776,233 for the past year.

THE plague is diminishing in Nedjeff, but has appeared at Maragala, in northern Persia.

PREPARATIONS are being made to rebuild the United States fishery on the McLeod river.

THE French Chamber of Deputies has voted 6,000,000 francs to indemnify the sufferers by the coup d'état in 1851.

NEARLY \$50,000 of stock has been subscribed towards the building of the proposed railroad from Santa Rosa to Benicia.

AN iron steamer is soon to be built for use on Lake Tahoe, towing logs. The material is now on the way from the East for her construction.

EX-GOVERNOR PACHECO, member of Congress from this State, is now in the city of Mexico, looking after the interests of the Topolomampo R. R. Co.

The Massachusetts House of Representatives have struck out of the prohibitory bill the section referring it to the people and then defeated the bill itself.

NEARLY 3,000 men are in the employ of the workers. Some 500 odd are employed near and Railroad Co. in San Diego county including all at National City.

Severe gales and floods have occurred on the Spanish coast of the Mediterranean. There has been considerable destruction of property in the province of Andalusia.

We know a man, says the *Republican*, a citizen of Santa Rosa, who can teach mathematics and Latin, at work in the woolen mill. He is not "waiting for something to turn up."

THE Denver and New Orleans Railway Co. have closed contracts for 12,000 tons of English steel rails, sufficient to extend the road from Denver to 10 miles south of Arkansas.

THUS far in the present calendar year the United States has received over five times as much specie from Europe as last year, gold receipts being about 12 times as large as a year ago.

THE new Governor of the State of Mexico has thrown obstacles in the way of the prosecution of work on the Sullivan & Palmer railroad. It is reported that 600 laborers have been discharged.

THE indications are favorable to a resumption of travel on the California Pacific railroad in about two weeks, and it is expected trains between Sacramento and San Francisco will resume running on the route about the 15th of April.

DURING March License Collector Sinton collected \$29,725.65 for licenses, as follows: General fund, \$24,624; municipal general fund, \$1,872; street department fund, \$1,392.25; special fee fund, \$1,892, and stock certificate transfer tax, \$540.

#### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

#### Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

#### Various Causes—

Advancing years, care, sickness, disappointment, and hereditary predisposition—all operate to thin the hair gray, and either of them inclines it to shed prematurely. AYER'S HAIR VIGOR will restore faded or gray, light or red hair to a rich brown or deep black, as may be desired. It softens and cleanses the scalp, giving it a healthy action. It removes and cures dandruff and humors. By its use falling hair is checked, and a new growth will be produced in all cases where the follicles are not destroyed or the glands decayed. Its effects are beautifully shown on brash, weak, or sickly hair, on which a few applications will produce the gloss and freshness of youth. Harmless and sure in its operation, it is incomparable as a dressing, and is especially valued for the soft luster and richness of tone it imparts. It contains neither oil nor dye, and will not soil or color white cambric; yet it lasts long on the hair, and keeps it fresh and vigorous.

FOR SALE BY ALL DEALERS.

INVENTORS, and others interested, will receive DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M., daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sealions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

### DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

SAN FRANCISCO, APRIL 2, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, dividend No. Twenty-seven (27), of Seventy-five (75) Cents per share, was declared, payable on TUESDAY, April Twelfth, (12) 1881, at the office in this city, or at the Agency of The Nevada Bank of San Francisco, in New York.

WM. WILLIS, Sec'y.

Office—Room No. 29, Nevada Block, No. 300 Montgomery Street, San Francisco, Cal.

### NOTICE.

Annual Meeting of Stockholders for the Election of Directors.

Notice is hereby given, that a meeting of the Stockholders of the REPUBLIC MINING COMPANY will be held in accordance with the By-laws of said Company, at the office of said Company, Room 25, No. 310 Pine Street, in the City and County of San Francisco, California, on TUESDAY, the Nineteenth (19) day of April, A. D. 1881, at one o'clock P. M., of said day, for the Annual Election of Directors, and the transaction of such other business as may properly come before the meeting. Transfer books will be closed on Friday, the Fifteenth (15) day of April, 1881, at three o'clock P. M.

WM. J. TAYLOR,

Secretary of the Republic Mining Company.  
Office—Room 25, No. 310 Pine Street, San Francisco, California.

**Lewis Consolidated Silver Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Pioneer Mining District, Pinal County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Twenty-third (23) day of March, 1881, an assessment, No. Four (4) of Six (6) Cents per share was levied upon the capital stock of the Corporation, payable immediately, in U. S. Gold Coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Second (2) day of May, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Twenty-third day of May, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. FEW, Sec'y.

Office, No. 310 Pine Street, Room 15, San Francisco, Cal.

## WATER JACKET SMELTING FURNACES

FOR SILVER, LEAD AND COPPER ORES WITH NEW AND IMPORTANT IMPROVEMENTS. HAVING FOR MANY YEARS MADE A SPECIALTY OF THIS LINE OF WORK, AND CONSTRUCTED, WITH FEW EXCEPTIONS, EVERY SMELTER IN USE ON THIS COAST, WE ARE PREPARED TO GUARANTEE MUCH BETTER RESULTS THAN CAN BE OBTAINED FROM THOSE OF ANY OTHER MAKE, AND THE BEST RESULTS POSSIBLE ON ANY CLASS OF ORE. SEND FOR CIRCULAR. RANKIN, BRAYTON & CO., PACIFIC IRON WORKS, SAN FRANCISCO, CAL.

### EXOTIC GARDENS.

Mission Street, opposite Woodward's Gardens; Branch, 1029 Sutter St. These Gardens have been Newly Stocked with a First-class assortment of the very best and most select plants for Conservatories or Open Grounds.

Prices have been reduced to suit the times.

Bouquets, Funeral Works and Cut Flowers furnished at short notice.

J. POUYAL, Proprietor.

## DEWEY & CO'S

Scientific Press

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

## INCERSOLL ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

## MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is hoisted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX,

49 Fremont St., S. F.

## HUNTINGTON'S Oscillating Stamp Mill

It has no Stems, Cams, or Tappets, and Adjusts Itself to the Wear of the Shoes and Dies.

For Simplicity, Economy, Durability and Effective Working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power.

Price, 900-Pound Hammer, - - - \$500.

### Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with  
Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when ad-  
visable.

STEAM LAUNCHES, Barges and Steam Tugs con-  
structed with reference to the Trade in which they are  
to be employed. Speed, tonnage and draft of water  
guaranteed.

STEAM BOILERS. Particular attention given to  
the quality of the material and workmanship, and none  
but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING  
MACHINERY made after the most approved plans.  
Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size  
made in suitable lengths for connecting together,  
sheets rolled, punched, and packed for shipment ready  
to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and  
Water Pipe made by this establishment, riveted by  
Hydraulic Riveting Machinery, that quality of work  
being far superior to hand work.

SHIP WORK. Ship and Steam Captains, Steam  
Winches, Air and Circulating Pumps, made after the  
most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City  
Water Works purposes, built with the celebrated Davy  
Valve Motion, superior to any other Pump.

### San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER.

Several first premiums received  
for Quartz Mill Screens, and Per-  
forated Sheet Metals of every  
description. I would call special  
attention to my SLOT CUT and  
SLOT PUNCHED SCREENS,  
which are attracting much at-  
tention and giving universal  
satisfaction. This is the only  
establishment on the coast de-  
voted exclusively to the manufac-  
ture of Screens. Mill owners using Battery Screens exten-  
sively can contract for large supplies at favorable rates.  
Orders solicited and promptly attended to.

## \$1,000 CHALLENGE!

### THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.  
Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.  
The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.  
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of \$1,000 each, and we mean business.

ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

#### A Card from Architects.

#### The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.  
It is with pleasure that we publish the following from prominent Architects in this city:  
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welch, P. Huorne, John Marquis, E. McDougal & Son, Wm. Mosser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newson, B. # “THE \$1,000 CHALLENGE” Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.  
Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.  
It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not a feasible plan on the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others.

## Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse".  
The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King" Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge".  
The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Henry's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

Mr. H. W. GREENWELL, of the Tintman Mine, El Dorado Co., or any other person can make \$1,000 by disproving the acknowledged superiority of my "CHALLENGE" Feeder, in a competitive trial, side by side, with any other Feeder, on wet or sticky ores from any mine, and I will give \$100 to any one who will procure the acceptance of this challenge, and arrange for a fair and impartial test on merit.

I mean business, Gentlemen, "either put up or shut up."

## TONITE.

THIS POWDER HAS BEEN IN USE IN ENGLAND FOR FIVE YEARS, and its consumption has steadily increased, the sales last year being quite 25% more than in 1879. It has given the greatest satisfaction, and it is preferred to any of the other High Explosives on the market, on account of its remarkable merits, which will be even more highly appreciated on this Coast, owing to the extremes of heat and cold in our Mining Districts. It does not Freeze; it does not deteriorate when kept in Hot Places; It does not yield Noxious Fumes.

Tonite Contains no Nitro-Glycerine, Chlorate of Potash, Sulphur, Picric Acid.

Nor any other substance which explodes by friction, HENCE IT IS CONSIDERED THE SAFEST BLASTING POWDER IN USE, yet when properly detonated it has NO SUPERIOR IN STRENGTH.

TONITE IS ALLOWED TO BE TRANSPORTED OVER THE RAILROADS OF GREAT BRITAIN, a privilege not extended to any other strong explosive, and which was granted only after subjecting it, under Government supervision, to the severest possible tests as to its safety.

THE TONITE COMPANY here has been in operation ONLY TWO MONTHS, but many of the LARGEST MINES IN CALIFORNIA, NEVADA AND ARIZONA have already adopted TONITE to the exclusion of all other compounds. See testimonials on file at the office of the Company. TONITE is destined to supersede Nitro-Glycerine Powder as surely as these have superseded common Gunpowder, as the Mines of this coast will be quick in appreciating the value of an explosive which, while as strong as NO. 1 GIANT, or any other Explosive in use, gives off no noxious fumes, does not freeze, does not lose its strength with age, and is safer to handle in all ways.

In offering this "EXPLOSIVE OF THE FUTURE," as it has been called by prominent scientific men in Europe, we simply ask consumers to GIVE IT A TRIAL. Please address all communications to

TONITE POWDER CO., 218 California Street, S. F.

HAMILTON SMITH, Jr., President, WM. LETTS OLIVER, General Manager.

RALPH L. SHAINWALD, Secretary.

## VULCAN BLASTING POWDER.

THE MOST ECONOMIC AND BEST NITRO-GLYCERINE EXPLOSIVE IN MARKET.

For the year 1881, we are prepared to make MOST LIBERAL ARRANGEMENTS. Having unequalled facilities we are in position to offer BEST TERMS, and purchasers will serve their own interest by conferring with the Company, before concluding arrangements elsewhere.

NOS. 1, 2 AND 3 VULCAN,

TRIPPLE FORCE CAPS,

And all Grades of Fuse at Bottom Rates.

[Written for the Press by G. KORTL.]

### Gold and Silver Anodes for Plating.

The quicker or slower transfer of gold or silver from the anode to the object to be plated, depends greatly on the density of the metals used as anodes. It may not always be considered an advantage if a thick deposit is obtained in a short time, employing a strong electric current and if the articles have to be furnished, but fancy articles of all kinds and such as do not require furnishing will admit of a speedy plating advantageously, and if an anode of lesser density is employed and the plating should go too fast, one battery may be used in place of two or more.

In order to illustrate the very different results obtained from differently prepared anodes, I will state the following experiment: I took two copper plates, of exactly the same area, both carefully weighed, and two silver anodes, both of them having also same area. The one consisted of rolled silver plate, the other was prepared porous. Over two vessels containing the bath, two copper rods were placed parallel, all conditions alike. In the first vessel opposite the copper plate was suspended the rolled silver, in the other the porous. The connection with the battery and the rods has been fixed in the middle between the two vessels. After three hours the battery was disconnected, and the two copper plates, after washing and drying, weighed. The plate from opposite the porous anode had five times as much deposited silver as the other plate, firmly adhering in both cases. This shows plainly that the density of the anode has a great influence on the solving property of the galvanic action.

The porous anodes of gold and silver are easily prepared; moreover, with reference to silver, it has the advantage that base silver hullion can be used for this purpose. The silver (granulated) is dissolved in nitric acid. Antimony, if present, remains undissolved. A drop of sulphuric acid added to the solution will indicate lead by producing a white precipitate, and in this case the acid must be added in small portions till all lead is precipitated. The copper remains in solution with the silver. The liquid is then diluted with distilled, or rain water and filtered. Into the clear filtered solution is now introduced muriatic acid or a solution of common salt, and by this the silver is precipitated as a white mass, which is filtered again and washed with water till all acid and copper is carried out. The precipitated silver (chloride of silver) is placed, while wet, in a porcelain or enameled iron vessel, diluted with water to a pulp, added a little sulphuric acid and metallic zinc (pieces of zinc sheet) and stirred from time to time. The white precipitate commences immediately to turn gray where it is in contact with zinc, and by degrees the whole mass appears lead gray, being now in metallic condition. The operation is finished when no white particle of chloride of silver is perceived. The finely divided metallic silver is placed into a filter and washed so long till all dissolved zinc is carried out, and in order to be sure that there is no chloride of silver among the metallic, the washing may be finished with ammonia. The silver is now pure enough for use. Upon a planed board a piece of linen cloth is laid, and on this the silver spread from one-quarter to one-half inch or more, according to the size needed, then covered with another like cloth, and finally with a board. The water is then pressed out from between the boards, and the silver plate allowed to dry after the upper board is removed. When dry, the plate is made red hot without having removed the cloth, which burns up. It is now ready to be used as an anode. If the silver with the cloth is glowing between two iron or earthen plates, it presents a nice, smooth plate, otherwise it becomes uneven.

The gold anode is made by dissolving gold in "aqua regia" (nitric and muriatic acid) and precipitated with a filtered solution of sulphate of iron as metallic gold, which, after being washed with warm water, is spread on the cloth and pressed like the silver above described.

So-called refractory ores in many districts are being handled better each year.

## Swinging Plates for Float Gold.

Not long since we described in these columns the swinging plates for saving float gold, made by Geo. M. Lederer & Co., of the Bay City Plating Works in this city. The engraving given on this page, will show the arrangement of the plates in a sluice clearly. The amalgamating plates are silver plated first, the same as the ordinary plates in use in quartz mills.

The swinging plate consists of a curved strip of silver-plated amalgamated plate, about three inches deep, and the width of the sluice or flume in which it is to be used. It is swung on eyes, through which passes a wire rod, resting on the edges of the sluice. The plate thus hangs transversely to the current, with its concave face up stream, the plate being half sub-

SWINGING AMALGAMATING PLATES FOR SAVING FLOAT GOLD.

merged. The movement of the water will keep the plate swinging. The floating particles of gold cannot escape touching the plate, and are caught on the quicksilver surfaces.

It is found in practice that across the sluice, immediately under each swinging plate, is formed a line of amalgam, which has dropped from the plate as it accumulated. The gold which is caught on the plates is thus saved. These plates are hung in sluices, a few feet apart. Very wide ones have been made for the sluices of hydraulic mines. The plates

KENDALL'S HOSE COUPLING.

cost so little, and are so effective, that they have come into extensive use in a very short time.

PAST AND FUTURE OF THE COMSTOCK. — During the past 20 years, says the *Enterprise*, the Comstock vein has given 16 bonanzas, from which 6,500,000 tons of ore have been extracted. The average assay of this large mass was \$56 per ton; it yielded in the mill \$41.80; and from the treatment of sluices \$5; total, \$46.80 per ton. The total value of the ore extracted was \$363,671,605, yielding a net sum from the mills and sluices of \$323,671,605. The average proportion of precious metals in value is 45% gold, and 55% silver. Let it not be supposed that there is nothing more down toward where all this came from. We have the same old vein—wider and stronger than ever—and the present barren belt cannot last forever. As we cannot always remain in "bonanza," so it is not likely that we shall always remain in "horrasca." From three mines which do not consider that they are doing anything more than picking up what comes in their way, we last evening shipped the snug little sum of \$109,535.15.

A USE FOR MINING BOATS. — The Gridley, (Butte county) *Herald* says: During the high water of last winter a mining boat was floated onto the ranch of N. Wilson, where it is now resting on dry land. The vessel is estimated to contain about 200,000 ft. of lumber, much of which can be used for building purposes. It is not known from what property the craft came, but there is a general belief that it is one of the renowned Henrietta experiments.

## An Improved Hose Coupling.

David B. Kendall, of Howland Flat, Sierra county, California, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improved hose coupling, which we illustrate on this page. The invention consists in the employment of a metallic fastener formed by attaching strips of metal to a ring, so that the whole will form a series of elastic tapering clamps, surrounding the hose at its joint, said fastener being capable of compression by a circular hand, which slips over it. It consists, further, in supporting the inside of the hose, at its joint, by a short piece of pipe, the pieces of hose fitting over it, the said interior pipe being combined with a certain construction of exterior compressing devices.

In the engraving B represents one piece of hose, and A another. An end of each fits over the pipe C. The outside fastener is formed by the ring D, to which are riveted strips of metal, A' A', having a shank, and a wide head or holder, b, curved as shown, to fit the circumference of the hose, the joint of which is made to come about the middle of the heads. The inner surfaces of the heads, b, are grooved, so as to form slight ridges, or corrugations, or teeth, for the purpose of securing a firmer gripe upon the hose. The heads, b, of the strips, A', are not

KENDALL'S HOSE COUPLING.

wide enough to have their edges meet. They thus form an incomplete cylinder.

The device is slipped over the hose so that the heads, b, shall cover the joint therein, and, on account of the heads being thicker than the shanks which connect them with the ring, the whole device is tapering, being larger at the head than at the ring.

The strips A', act as springs, which allow the segmental heads to be compressed when the ring or hand D, is slipped upon it.

The hand D is a transverse section of a cone, in order to fit the shape of the fastening device and act as a holder, which, when pushed up toward the heads b, compresses them, so that their grooved inner surfaces are pressed against the hose. The inner pipe, A, resists the compression, and thus the ends of the hose are held firmly between them.

The device is a very simple one and is inexpensive. The inventor may be addressed for further information.

NON-ASSESSMENT. — The New York *Bullion* is beginning to realize the situation in regard to assessing mines. There is no disguising the fact that mining companies organized under the laws of this State are hampered by the provisions regarding the non-assessment of stockholders. Presumably for the benefit of the stockholder, the law is really a menace to his interest. The list is a long one of mines shut down and the money previously invested absolutely lost, because of the inability of the owners to assess themselves to develop properties demonstrated to be worth developing.

## The Sutro Tunnel.

At the annual meeting of the Sutro Tunnel company, held last week, the following Directors were selected: Charles M. Brush, President; Wm. Irvin, Vice-President; F. F. Low, David Cahn, Hugh Marshall, Wm. Johns and Joseph Aaron; Treasurer, Lazard Freres; Secretary, Pslham W. Ames; Superintendent, C. C. Thomas.

The Superintendent's report states that 2,149 ft. were made on the north lateral tunnel, and 1,903 ft. on the south lateral tunnel, during the year, with the details of the work performed in all its parts. He also refers to the low-grade ores still remaining in the different mines on the Comstock lode, which can be worked to a profit, which, he says, would not only be a vast industry by itself, but would afford new opportunities for developing new bodies of ore. He thinks that the facilities for cheap mining and transportation now afforded by the Sutro tunnel and its branches are matters of paramount importance to the company and to the mine owners of the Comstock lode. He also decidedly recommends prospecting along the line of the Brunswick lode, which he says is traceable on the surface, by well-defined croppings, a distance of two and a half miles, and which he says has never been prospected at the depth of the tunnel level. From two small drifts on that lode from the main tunnel, ore was taken assaying \$10 to \$30 per ton. Ore from this lode, now being extracted from near the surface, is paying an average of \$12.93 per ton, as appears from returns to the Assessor. The tunnel is now in his order to improve and develop this lode at a minimum expense, and as there is every indication that this vein contains paying ore—to what extent can only be ascertained by development—he recommends that work upon that portion of it owned by this company should be commenced as soon as practicable. He also recommends continuing the main tunnel into Mt. Davidson by a prospecting drift 2,000 ft. in length, as in his opinion, "the indications on or near the surface of the Mt. Davidson warrant further explorations in this direction," in support of which recommendation he cites the opinion of Prof. Church, expressed in his recent report on the Comstock lode.

NEW GEYSERS IN MONTANA. — According to the *North Montana River Press*, two new geysers have appeared in a strip of that Territory known as "Sag." The first was seen about a month ago, but has only lately assumed remarkable proportions. It is situated in a small canyon running out from the wall of rocks on the east of Alkali lake, and throws up a jet of hot water and steam over 100 ft. high. The height of the other geyser is only 50 ft, but the diameter of the spout is larger. The geysers are, of course, intermittent, and seem specially active in the morning. The formation of the country is a sandstone and gneiss, and has all the appearance of being an ancient river bed.

THE Chicago *Tribune* interviews of the 11th establish the fact that the wages of mechanics, artisans and day laborers will be 20% higher the coming season than last season, and the price of building material 10% higher. Nevertheless, there promises to be great activity in building. A thousand people per month are coming to Chicago from immigration alone, and the demand for house room and business sites is constantly growing, more especially in the suburban towns, where building is very lively.

ALASKA MINES. — The *Tribune's* Washington special says: Major Morris, who is now in Washington, is endeavoring to secure the establishment of regular mail service between Sitka and the new mining districts. He visited Alaska last fall, and says that among the valuable discoveries made while he was there was a rich silver mine on an island near the mainland, not far from the Harris district.

THE Indian Queen M. and M. Co. of Esmeralda county, Nev., has paid dividends since the 5th of January, 1881, to date, of \$20,000, and on the 7th inst. declared one of \$6,250, payable on the 20th inst. Shipments of hullion from March 22d to April 4th, amounting to \$8,800, have been made.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EBS

### Silver in Sedimentary Rocks.

EDITORS PRESS:—You published in your issue of February 19th a paper on the occurrence of silver in sedimentary rocks, which I had read at a January meeting of the California Academy of Sciences. In that paper I criticised the views advanced by Prof. Newberry of Columbia College, concerning the origin of the Silver Reef sandstone deposits in Utah. Since his original brief statement in the *Engineering and Mining Journal* of New York for October 23, 1880, Prof. Newberry has stated his views more in detail in a letter to the same journal. I am exceedingly sorry that the latter statement came to my notice too late to be considered in the same issue of the PRESS containing my original paper. With your permission, however, I will reproduce here Prof. Newberry's theory, and state the objections which I think may fairly be made to it.

Prof. Newberry says: "Anyone who has a little knowledge of chemistry and geology, and who will travel over the area underlain by triassic rocks in the West, will have no difficulty in grasping the true theory of the deposit of silver and copper in them. Thirty of the elements have already been found in solution in sea water, and among these are gold, silver, copper, lead, zinc, iron, manganese, arsenic and other metals. The triassic sea, as we know, covered a large part of the western half of the continent; but in central Utah it had a strongly marked ebb line, and thence to the Mississippi was shallow and to a large extent circumscribed by land. This shallow sea was, however, swept by currents which gave to the sediment it deposited a strongly marked cross-hedding, while chemical agencies were in action, which produced equally striking results.

"Over large areas, water basins were evaporated, causing the precipitation of great quantities of gypsum and salt. These conditions were decidedly unfavorable to animal or vegetable, and as a consequence throughout the area under consideration, there are no limestones in the trias, and the sandstones are almost always barren of fossils, and therefore are red in color.

"Near the Utah shore of this basin, the water would seem to have been more highly charged with silver than elsewhere, though it was also the associate of the more abundant copper in New Mexico, the Indian Territory and Texas. Doubtless this silver was brought up in springs on the old land from the same sources which furnished so large an amount of silver to the fissure veins formed there long after.

"Near the old shore the driftwood brought down by the draining streams and scattered by the shore waves, when hurried in the accumulating sediment, became more or less replaced by copper and silver precipitated by the reducing action of organic matter, which is manifested in so many different ways. The quantity of silver in some of the bays and estuaries carried by draining streams, perhaps fed in part by mineral springs, may have been greater than that in most parts of the water-basin, and hence the sediments formed there hold a quantity larger than the average. We find the same variation in the distribution of copper farther east. In some places it was so abundant that it was not all taken up by the decaying wood, but formed concretions of sulphides in the sand or clay. \* \* \* the ores of silver and copper plainly existed as solutions, which saturated the sand when it was collected, and deposited the sulphides with sandstone after the mechanical action which transported the sediment was at an end. All this, however, was within the triassic age, while the water was shallow and highly charged with mineral matters. Afterward the sea deepened, and 500 ft. of limestone were in the jurassic age, spread over the triassic sediments. Neither then nor during the following cretaceous age—when 2,000 ft. of strata, like the jurassic, free from copper and silver were deposited—could the impregnation of the triassic rocks have taken place. Later (in the tertiary age) when the foundations of all of this country were broken up, and fissures were opened from which issued steam and hot water carrying mineral matters that were deposited in every receptacle open to receive them, it is possible, though I think not probable, that in some places the porous sandstones of the trias were penetrated by solutions from which the sulphides of copper and silver were precipitated. That there has been some recent change of position in the silver contained in the sandstones seems proved by the accumulation of chloride in the cracks and joints which are of modern date.

"If these incrustations should prove to be confined to the most disturbed districts like Silver Reef, it would be an argument in favor of the modern impregnation of the porous portions of the sandstones; but it would not account for the replacement particle by particle of wood tissue, by the sulphides of silver and copper. Yet we know that all porous rocks which lie beneath the surface are traversed by mineral solutions, which frequently produce important changes, such as the conversion of a vesicular

trap into an amygdaloid by the filling of the closed cavities with silica or zeolites."

It would appear from the foregoing that the initial point with Prof. Newberry, in the formation of his theory is the occurrence of vegetable remains partially or wholly converted into sulphides of silver and copper; for evidently if the reduction of these metallic sulphides out of solutions could be effected only by fresh vegetable tissue, then the impregnation of the sandstones must have been simultaneous with their formation, and the most probable method of this impregnation, is that so plainly set forth by Prof. Newberry.

If however it can be shown that the organic remains of the triassic sandstone could effect this reduction long after their original deposition (as late even as the tertiary) we should not then be compelled to resort to the unusual assumption that silver and copper springs have emptied their highly charged mineral solution into the surface drainage of the country, a phenomenon that is never witnessed at the present day. With the exception of the occurrence of the mineralized organic remains, Prof. Newberry himself concedes the possibility (but not probability) of explaining the phenomena at Silver Reef according to the theory which I have previously advocated.

Now, Prof. Newberry's objection can be removed, and the phenomenon in question explained, by the not improbable assumption that from the time of their original deposition in triassic times until the advent of the mineral solutions in tertiary times, the plant remains were preserved in a state of imperfect lignitization, in which condition they would still largely retain their power of reducing metallic sulphides from solution, with the preservation of all the details of organic structure now observable upon the fossils.

After reading my original paper, in thinking further on the subject, Prof. Newberry's theory occurred to me. In fact, it is substantially the same as that proposed by Von Cotta for the Mansfeld Kupferschiefer in Germany, and by Murchison for the copper deposits in sedimentary rocks, in the government of Perm on the west flank of the Ural mountains. (*Erdlagerstätten II*, 110, 551.) I reject it, however, because it did not explain the apparent connection, insisted on by Rolker, between the eruptive rocks and the larger concentrations of ore in the sandstone at Silver Reef and Virgin City, in Utah, and at the Nacimiento mountains in New Mexico. It will be observed that Prof. Newberry explains these local concentrations by supposing them to be formed in estuaries, receiving streams fed by mineral springs. According to this view, the connection between the igneous rocks and the larger aggregations of ore is a purely accidental one; according to my theory it is a genetic one.

It will be observed that throughout my paper, I spoke with great caution, for I was discussing observations that had not been made by myself, and for the correctness of which I was compelled to depend upon others. If the observations are imperfect, or not sufficiently extensive, then the conclusions to which they lead may be false. For instance, if, contrary to the explicit statement of Supt. Rolker, large concentrations of ore should be discovered at long distances removed from massive rocks, other conditions likewise being favorable, I should at once be inclined to accept the theory advocated by Prof. Newberry, the foundations for which theory were so admirably laid by the exhaustive investigations of *Dieula fail* (*Annales de Chimie et de Physique*, 1879; Vol. xviii, p. 349). Furthermore, if it should be confirmed that the triassic sandstone of Utah and New Mexico are homogeneously impregnated with a very small amount of copper over very extensive areas, I should be inclined to believe that the impregnation of the sandstones was simultaneous with their formation and effected by precipitation from shallow inland seas, such as certainly existed over this area in triassic times. But I certainly do not believe that it has as yet been established that the Silver Reef or the Nacimiento mountain deposits are of simultaneous formation with the enclosing sandstones.

In conclusion allow me to remark that I do not class Prof. Newberry among the "hasty theorists" and "average modern investigators" mentioned in my paper; for there are few geologists in whose scientific work I have more confidence than in his. A. W. JACKSON.

Museum of Economic Geology,  
University of California.

### San Francisco and Pine Grove District, Utah.

[From our traveling correspondent.]

EDITORS PRESS:—In my last letter I gave a description of the great Horn Silver mine, which is one of the most extensive in this Territory. Following this ledge where it ascends San Francisco mountain N. 20° W., and at a distance of one and a half miles from its working shaft, the original formation of trachyte on the east and limestone on the west changes to granite and porphyry on the east and metamorphic sandstone, or, as it is commonly called, quartzite, on the west side of the ledge. Here we find a large outcropping of copper ore, about 35 ft. wide, which assays 25% copper, 15 ounces silver and about \$5 gold. The claims located on this section of the lode are the Rosa, Great Republic, Vanderbilt, Woolcott and Spanish. Work of developing them has just been started. A company, of which Thomas Couch, Wm.

Kissel, E. Buettner and Col. Compson are the principal members, was recently organized, and a working capital of \$100,000 has been secured in the East by the sale of stock. Fifty thousand shares were readily disposed of at \$1 per share, but the stock is no longer to be had at that figure.

The only developments thus far made have been on the Rosa. The intention is to run a tunnel westerly from the east foot of the mountain and at the same time sink on the Vanderbilt, so as to connect with the tunnel. It is expected that the main ledge will be struck at 550 ft., and connection between shaft and tunnel made at a depth of 300 ft. The Great Republic, Vanderbilt and Spanish, which are all situated on the main ledge, show, instead of copper, galena and carbonates.

Judging from the high standing and extensive experience of the men connected with this new enterprise, a bright future is predicted for the Great Republic mining company.

In the Carbonate mine, situated about two miles north of Frisco, considerable work is being done, and the main shaft have already attained a depth of 500 ft. The company, of which Mr. C. D. Bigelow is the president and moving spirit, have recently added to their extensive works above ground a Frue concentrator. Owing to the mixed character of the ore body a great many experiments have been resorted to in the past without encouraging results, but all difficulties in the way of successful working are now thought to be overcome. As yet the company have very primitive hoisting works, consisting of a small donkey-engine and a bucket, and, as I did not relish the pleasure of a ride in such a conveyance down a shaft 500 ft., which, for the first 135 ft., is perpendicular, and then runs on an incline, I cannot state from personal observation anything about the ledge or ore body.

### The Pine Grove District

Is situated 25 miles southwest from Frisco. It was organized in 1872, but abandoned until 1879. The principal mines in this district are the Carrie Lusille, Crystal Palace and Pinafore, which belong to the Pine Grove Con. Silver Mining Co., organized under the laws of Utah. John M. Burke is President, Col. Kahn Vice President, C. W. West Secretary, and Peter Tischer Superintendent. The formation is quartzite, and the ore is hard carbonates, mixed with some galena. On the Carrie Lusille, an incline shaft has been sunk to a depth of 150 ft.; and \$6 ft. from the top of the shaft a level running east developed an ore body three feet in width. Five tons of this ore shipped to Salt Lake city went 16% lead, 77 oz. silver, and \$8.50 gold to the ton, which may be considered a fair average of what has been found. Another level run northwest showed less ore and of lower grade. The width of the ledge, which on top only measured from 6 to 8 inches, has increased to about 2½ ft. in bottom of the shaft; and assays taken from there showed 58 oz. of silver, \$10 gold, and 14% lead. Further sinking was abandoned on the 20th of March, owing to a strike of water, which amounts to 30 gallons per hour; but Mr. Tischer is again preparing to prosecute the work vigorously, both in the shaft and on the levels.

The Pinafore has a tunnel 75 ft. and a shaft 40 ft., showing a large body of ore carrying 65% lead. The Chrystal Palace has an incline shaft 40 ft., but very little ore, though it may yet prove a valuable mine.

All these are true fissure veins and the croppings can be traced for 500 ft. on the surface. Other mines in this district with good ore in sight are, the Col. Compson, Grey Eagle, Hidden Treasure, Miller and Carbonate, but only the two first named are at all developed, the first being down 110 ft. and the other 50 ft. Timber and water are plentiful in this vicinity. —A. L. M.

### Copper Smelting—Its History and Processes.

[By HENRY HUBERT VIVIAN, M. P.]

The President of the Royal Institution for the present year, H. H. Vivian, Esq., M. P., delivered the last of the pre-Christmas course of lectures in the theater of the Institution, at Swansea, South Wales, on Monday evening, December 20, 1880, before a large and attentive audience. Mr. Vivian said:

I shall endeavor in the lecture I am about to give on "Copper Smelting" to avoid on the one hand mere scientific and, on the other, mere technical details. My aim will be to tell you as simply and concisely as I can, the story of copper smelting as I understand it; to import into it some of the experiences of the 37 years during which I have been actively engaged in it; and in doing so, I hope that I may succeed in giving a few grains of useful information, both positive and negative; that is, both what to do and what not to attempt. Smelting is a "dry" process necessarily, and although it has much "fire" in it, I fear I can impart none to my tale tonight. Now it must occur to anyone, I think, in considering this question, to ask in the first instance how and

When Copper Smelting Began.

I am not aware that a perfectly satisfactory reply can be given to that question. The only authentic history we possess of very early times is the Bible; in it we find constant mention of brass, while the word "copper" occurs only once in the Old Testament, namely, in the 8th Ezra, 27th verse, where it is stated that "two vessels of fine copper, precious as gold, were offered

with gold and silver vessels to the house of God;" but even in that case the annotation in the margin is, instead of "fine copper," "yellow or shining brass." It seems, therefore, uncertain whether, even in this solitary instance, "fine copper" was used. There is, indeed, grave reason to doubt whether pure copper was used in very early ages, either in Europe or Asia. On the other hand, brass, or rather bronze, was in common use, although the above extract, dating only 457 years B. C., seems to assign to it a very high value. I say bronze and not brass, because the alloy was copper and tin, which is, properly, "bronze," while "brass" is an alloy of copper and zinc. What we now call brass was produced by heating metallic copper and a mineral called "Lapis Calaminaris" together with charcoal in a crucible, whereby the carbonic acid was driven off, and the zinc contained in the "Lapis Calaminaris" was reduced to metallic zinc, and thus alloyed with the copper. It seems also probable, from the evidences produced by Dr. Percy, in his valuable work on zinc, that the furnace deposits produced in smelting zinciferous copper ores were used to produce brass by heating them with metallic copper precisely as in the case of Lapis Calaminaris. The metal thus produced was called "Orichalcum" by the Romans, in contradistinction to "Æs," which, although often ignorantly translated brass, was really bronze, that is, copper and tin with occasionally some lead—9 to 1. "Orichalcum" seems to have been well known at the commencement of the Christian era; but I can find no evidence of its earlier use, and I think we may assume that when "brass" is spoken of in the Bible, an alloy of copper and tin, not copper and zinc, is meant. There is scarcely a book in the Old Testament in which the word brass does not occur; in fact, it is mentioned 38 times in the Pentateuch, excluding Deuteronomy. Beginning in Genesis, we find, in the 22d verse of the 4th chapter, that "Zillah bare Tubal Cain (the seventh in descent from Adam), he was an instructor of every artificer in brass and iron." The date assigned to this chapter is 3875 years before Christ. In this book of Exodus, there are 10 separate cases in which brass is mentioned. The first is in the 25th chapter and 3d verse, where God directs Moses to instruct the children of Israel to bring "offerings of gold, and silver, and brass for the purpose of constructing the 'Sanctuary,' the supports and vessels of which were to be of brass;" the date assigned to this is 1491 B. C.

It would occupy too much of my time to attempt to go through the numerous instances in which brass is mentioned in the Old Testament; but I will first ask one moment to draw attention to the extent to which brass entered into the construction of the Temple of Solomon, B. C., 1005. We are told that King Solomon sent to Tyre for a man called Hiram, a worker in brass, "who was filled with wisdom and understanding, cunning to work all works in brass;" he cast two pillars, each 18 cubits high, or 32.832 ft. high, nearly 33 ft.—and 12 cubits or 21 ft. in circumference, say 7 ft. in diameter. He then cast a chapter or capitol for each, 5 cubits or 9 ft. high. Then follows a detailed description of the brass work with which he ornamented these pillars, which stood on each side of the porch. He also made a molten sea of brass 18 ft. in diameter, and 12 oxen of brass to support it. He made various other large bronze castings richly ornamented and engraved with lions, oxen and cherubim. Twenty-five verses are devoted to the description of Hiram's works in brass. We may deduce from this passage that the casting of bronze had attained great perfection nearly 3,000 years ago; in fact, it would be a considerable work, even at the present moment, to cast bronze pillars 33 ft. high and 21 ft. in circumference, or a bronze basin 18 ft. in diameter. To make such a casting, a large quantity of metal would have to be melted at once, not probably in crucibles, but in a cupola or reverberatory furnace, and great skill would be required in manipulating so heavy a casting. It is also clear that the art of molding was well understood. From whence did the copper and tin come, and who smelted it?

If we turn from the inspired history of the Bible to those

### Records of Past Ages

Which are stored up in the harrows, lakes, refuse heaps and battle fields of Europe, we find equally clear and indisputable evidence of the great antiquity of copper, not indeed, as copper in its pure state, but as bronze. There seems no reason to doubt that bronze was the first metal used by man for the construction of implements and weapons. As a metallurgist, I should have certainly said, *a priori*, that iron, from the abundance of its ores, occurring, as I think I am safe in asserting that they do, in every known geological formation, and from the ease with which rich ores of iron can be reduced to metallic iron, ought to have been the first to attract the attention of man; but I am bound to say, that the evidence adduced by my friend, Sir John Lubbock, in his admirable work on "Prehistoric Times," and by others, appears to me to leave no doubt that an age of bronze succeeded the stone age, and preceded the iron age. I think I am right in saying that no attempt has been made to fix anything like an approximate date to the commencement of the bronze age; but Sir John Lubbock appears to be of opinion that the transition from bronze to iron took place about 900 years B. C. This would be nearly 2,800 years ago, and through what a long vista must we look back before we see the commencement of

(CONTINUED ON PAGE 246.)

MECHANICAL PROGRESS.

Progress in Metallurgy.

Jacob Reese, the well-known scientist, metallurgist and inventor, of Pittsburgh, Pa., furnishes the following interesting items on the above subject to the *American Machinist*. Two hundred years ago wrought iron was only made by the Catalan process, the product being known as charcoal blooms. By the ordinary Catalan process it required two hours to convert 300 lbs. of cast iron into wrought iron, and required 300 bushels of charcoal to the ton of blooms.

"The puddling process, invented by Henry Cort, and improved by Samuel Rodgers, will convert 500 lbs. of cast iron into wrought iron in two hours, with an expenditure of ten bushels of coal to each ton of fibrous wrought iron.

"By my improved Bessemer process, I am now enabled to convert ten tons of cast iron into fibrous wrought iron in 20 minutes, at an expenditure of ten bushels of coal to each ton of fibrous wrought iron ingots produced.

"Five years ago, Sir Henry Bessemer and all the leading metallurgical experts of the world considered it impossible to remove phosphorus from the metal by the Bessemer process; consequently, no metal could be used in the converter which contained over one-tenth of 1% of phosphorus. Now, by the basic improvements to the Bessemer process, metal containing from 2 to 3% of phosphorus may be treated in a converter to advantage, and a steel produced more free from phosphorus, and better in every respect than that produced by Bessemer's acid process.

"The old method of making railroad spikes was by rolling a pile down to a rod of suitable size, to do which required a man to rough down and another to rough up, and another to straighten the rods, and a man to spear the rods into suitable lengths, and a man to weigh, and a laborer to carry them to the spike factory, where one end of the rods was beated and fed—one spike length into the spike machine at a time, one machine making from three to five tons per day. "Now, we have in Pittsburgh a continuous spike mill, at one end of which the heater inserts the pile or billet. By the automatic action of the machine it is drawn forward and reduced on all sides, until it emerges from the other end in shape suitable for a spike. The rod is then cut in two pieces of equal lengths, and the ends so cut inserted into two self-feeding machines and shaped into spikes, which are caught by an archimedean conduit, and delivered red hot, at the point desired for packing, and this at the rate of 80 tons per day."

To the above we may add the following: Cast iron was not in commercial use before the year 1700, when Abraham Darby, an intelligent mechanic, who had brought some Dutch workmen to establish a brass foundry at Bristol, England, conceived the idea that iron might be substituted for brass. This his workmen did not succeed in effecting, being probably too much prejudiced in favor of the metal with which they were best acquainted. A Welsh shepherd boy named John Thomas had, some little time previous to this, been received by Abraham Darby into his workshop on the recommendation of a distant relative. While looking on during the experiments of the Dutch workmen, he said to Mr. Darby that he thought he saw where they had missed it. He begged to be allowed to try; so he and Mr. Darby remained alone in the workshop all night, struggling with the refractory metal and imperfect molds. The hours passed in and daylight appeared, but neither would save his task; and just as morning dawned they succeeded in casting an iron pot complete. The boy entered into an agreement with Abraham Darby to serve him and keep the secret. He was enticed by the offer of double wages to leave his master, but he continued faithful, and from 1709 to 1822 the family of Thomas were confidential and much-valued agents to the descendants of Abraham Darby. For more than 100 years after the night in which Thomas and his master succeeded in making an iron casting in a mold of fine sand contained in frames and with air holes, the same process was practiced and kept secret at Colebrook Dale, with plugged eyeholes and barred doors.

A MECHANICAL COTTON PICKER.—A Southern planter writes to Boston respecting a combination cotton picker with fingers of iron, which is the beginning of a revolution in cotton growing. He believes it will lessen the price of cotton five cents a pound. The machine, by means of eaters and fans, takes the fiber from the ball, removes the seeds and all impurities, finally delivering it straightened, ready for the bale. Efforts are making to develop the invention in season for the exhibition at Atlanta.

TO SOFTEN BRASS CAST FROM SCRAP.—The trouble with brass cast from scrap, is usually to be ascribed to the presence of iron or steel scrap that gets mixed with it in the shop. In that case only a chrome steel tool will answer to work it. The *Manufacturer and Builder* suggests that the best plan is to melt the scrap at a low heat as possible, with the addition of some powdered glass as flux, by which procedure the iron will be fluxed out, and the brass left comparatively free.

How to Increase the Power of the Steam Engine.

It frequently happens that engines which were originally of sufficient power to do the work of a manufacturing establishment, become unable to do the work, owing to an increase in the business; and while the cost of replacing an engine with one of sufficient power would be a matter of nominal consideration, the time expended in removing and replacing it with a larger one might involve a serious loss to the owner, in case he had large orders for goods to fill at profitable prices. Under such circumstances the three most practicable ways to remedy the difficulty for the time being would be—first, to raise the pressure, providing the boiler is considered safe; second, to increase the speed of the engine; third, to replace the old cylinder with a new one larger in diameter.

For a moderate increase in power the last plan would be the most safe and practicable, as the active condition of steam boilers is not always understood; and, without a thorough knowledge on the subject, it would be unwise to increase the pressure, nor should any engine be run at a higher speed than it is capable of standing without springing or shaking to pieces.

Of course the margin for increasing the size of cylinder for any engine, and using all the other original parts of the engine, is limited, and should never exceed two inches; as, to exceed that limit, the other parts would be too light, and become liable to spring. An engine will develop more power by increasing its speed, but will use more steam, and as a consequence more fuel will be consumed. The overtaxing of steam engines and boilers, or any other class of machines, is sure to induce waste either in fuel or wear and tear. Steam engines or boilers, or any other class of machines that are too large or too small for the work to be performed, are not economical.

On the Elasticity of Wire.

Mr. J. J. Bottomley has published the results of a series of experiments made on the elasticity of wire. Using a continuous arrangement for applying the stretching weight and employing some very soft iron wire which had been specially prepared, and which was used in former experiments, the greatest weight which could be rapidly put on the wire without breaking it was determined. It was found that with a weight of 41 lbs. gradually applied in 6 1/2 minutes, the wire stretched by 24.4% of its original length, and broke 18 minutes after the weight was put on. With the same weight, 41 lbs., applied in 6 1/2 minutes the wire stretched 22.1% and broke in 24 minutes. With 41 lbs. however, applied in 7 1/2 minutes, the wire stretched 18% and did not break. This weight, therefore, appeared to be just as much as the wire would bear with this method of applying the weight. Accordingly it was applied to a great number of wires for different lengths of time, for the purpose of hardening them, and arrangements have been made for keeping a number of wires for very long times with this stretching force applied to them. The amount of extension produced by the application of the hardening stress was observed in each case.

After the hardening stress had been applied for a certain time the additional weight necessary to break the wire was determined, and also the additional elongation before breaking, which was in all cases almost insensible. The wires seemed permanently set in about 40 minutes from the time when the hardening stress was applied. They did not alter in length till just before they broke, when they generally stretched .04 to .08 inch on a length of about 70.8 inches.

WORK FOR WORKING.—How much of work is done, time and trouble expended in foolishness few know. Even the foremen of shops don't know half the nonsense in work that is done for the lack of common sense. Much of the time wasted in shops in apparent occupation is that used up in unnecessary finishing. There is a large amount of work done, in the machine shop, for instance, that is wasted work. No allusion need be made to the shortcomings of apprentices who simply make mistakes for need of instruction, oversight and guidance; but old workmen seem to think they show their skill and exhibit their workmanship by finical and needless finish on plain work. The sole object of work is to produce the result. And the result is just as certainly produced when the completed machine does its duty as if the machine was also a work of art. The finish and polish are necessary adjuncts when finish means perfection and polish means attraction; one is for use and the other for financial returns. But when unnecessary labor is expended on a machine its value is not enhanced to the purchaser, and the cost of the unnecessary labor is borne by the builder. All the working actuating parts of any machine should be finely finished. That is, no working part should be slighted. But it is not necessary that any portion of a machine not exposed to view or in daily use should be finished—polished. A casting or a forging, cleaned from its sand, sprues, and oxide, will do just as good work and fill its place as a part of the machine as well as though it should be polished so the sun is reflected in it. The grand idea of a finished machine is adaptability, proportion, usefulness and durability. These conditions secured, all other work is wasted.—*Boston Journal of Commerce*.

SCIENTIFIC PROGRESS.

Experimental Transformation of a Living Organism.

The bulletins of the Academy of Science at Munich contain a report of a discovery which has the highest interest for the theory of evolution, and will perhaps be of practical value. Hans Buchner, well known as a skillful experimenter, has succeeded in transforming a microscopical kind of fungi, which is a dangerous agent of disease, into another kind of fungi, which is perfectly harmless. He reached this result by a continuous treatment of the fungi for the space of six months, and by producing 1,500 generations. In this manner he was able to transform those bacteria that cause "milk-rot" (the dreaded inflammation of the spleen), into the so-called "heupilze" (fungi of bay), which are harmless, and vice versa. And even more, he produced an organism that forms a connecting link between the above named fungi, and which was hitherto unknown. To give a detailed description of the experiment would take too long. We only mention two facts which will show with what organisms the experiment was made. The bay fungi, such as can be produced in an infusion of bay, have such an enormous vitality that their life cannot be destroyed even by boiling the liquid which contains them for hours, and each of these little beings is able to propagate itself and to produce ten generations per day.—*Scientific American*.

IMPORTANCE OF TEACHING SCIENCE.—From a recent debate in the House of Lords, it seems the importance of teaching science is beginning to be recognized among the English nobility. According to *Nature* the Earl of Spencer made use of the following remarks: "There was no more important matter than the application of science to the art of agriculture. Great attention had of late years been properly called to the great aid which science gave to the various classes of manufacturers and producers; and that principle applied with quite as great force to agriculture as any other art. That was especially the case at the present moment, when the country was inquiring narrowly into the whole of our agricultural system. If science could enable an agriculturist to produce more from land than he had hitherto done, it would add another to the many useful things it had been the means of accomplishing. It had been decided by the Science and Art department, in consequence of the pressure for accommodation for science classes, not to have a special class for agricultural science this year, seeing that botany, geology and chemistry, which are so intimately connected with agriculture, are taught separately."

ASTRONOMICAL OBSERVATORIES.—According to the *Annuaire* of Brussels Observatory for 1881 there are at present 118 public astronomical observatories in full activity, viz.: 84 in Europe, 2 in Asia, 2 in Africa, 3 in Oceania and 27 in the two Americas. The United States alone have 19, Mexico has 2, Brazil, Chile, Columbia, Ecuador, the Argentine Republic and New Britain 1 each. In Europe Prussia is the State which has the most public observatories; it has 29; next come England and Russia, which have respectively 14 and 12; then Italy, which has 9, Austria, 6, France, 6, Switzerland, 4, Sweden, 3, Holland, Norway and Portugal 2 each; lastly, Belgium, Greece and Denmark. The oldest observatory in operation at present is that of Leyden, founded in 1632. In America since 1870 six observatories of the best construction and most perfect equipment have been established.

AN ILLUSTRATION OF AMOEBOID MOVEMENTS. The curious movements of the lowest forms of life are illustrated by Dr. Haeckel with a simple mechanical contrivance, which will be found useful in the classroom. He takes an India-rubber ball, perforated with a number of small holes, fills it with colored albumen (white of egg), and immerses it in a solution of sugar of about the same density as the albumen. A gentle pressure applied to the ball forces out the albumen in finger-like processes, which are retracted when the pressure is relaxed, thus clearly imitating the extension and retraction of the amoeboid processes of protoplasm familiar to all microscopists.

MINE EXPLOSIONS.—It is well known that if a long, dry tube, open at both ends, be held over a jet of burning hydrogen a musical sound is produced, the pitch and quality of which vary with the length, thickness and diameter of the tube. It has been proposed, says the *Electrician*, to adapt such a tube to the safety lamp underground, and to place it near a telephone in communication with another telephone in the manager's office on the surface. The alteration of the sound, due to a greater or less admixture of gas with the air of the mine, would warn the manager of the state of the atmosphere in the workings.

SPECTRUM PHOTOGRAPHY.—Capt. Abney recently read an interesting paper before the Royal Society touching some important results he has recently obtained in spectrum photography. His experiments relate particularly to organic chemistry, and are likely to upset some of the recognized theories of our chemists; here is one instance the more of the value of photography in scientific research.

Railways and Rainfall.

Scientists are again discussing the connection alleged to exist between the operations of railways and the amount of rainfall. It is regarded as a remarkable fact that before railways were extended to the Pacific, the country lying between the Sierra Nevada and Rocky mountains was subject to an almost continuous drouth. Since then, however, the region has been visited with frequent falls of rain. What has produced the change? is the question. Some suggest that it is due to a change in the electrical state of the atmosphere, produced by the conduction of the subtle fluid into the region by the iron rails. Others assert that it is caused by the atmospheric disturbances arising from the frequent passing and repassing of trains. It is shown that up to 1854 the United States had been periodically visited by great and general drouths, but since that year there has been no such visitation; or, in other words, that the building of such a vast network of railways as has been constructed in the last quarter of a century has had the effect of promoting the fall of rain. Since the general introduction of railways in Europe, also, there has been no drouth such as previously at short intervals caused widespread distress. In the case of England it is remarked that although the climate has been always humid there has been a growing excess of rainfall during the period of railway building, until now she gets far more than is beneficial to the crops. This has been noticeable to an alarming degree in the past few years. We give these conclusions for what they may be worth, and merely as showing the drift of current discussion on this point.

UTILIZING SOLAR HEAT.—It is not impossible that, before our coal fields are exhausted, we shall have discovered some means of doing many things without that fuel—at least, in regions where the sun shines. We are already acquainted with M. Mouchot's solar engine, but that method of utilizing the heat of the sun has been eclipsed by an improvement devised by M. Fieffe. It is stated that the latter has gone so far as to utilize 80% of the available heat of the sun's rays at Paris, and has actually constructed an apparatus with which he pumped water to a height of 10 ft. at a rate of over 20 gallons a minute. As in Mouchot's solar engine, a reflector receives the light and concentrates it upon a boiler—in this case containing nearly 90 gallons of water, which, under a clear Paris sky, begins to boil in about 40 minutes, and in a few minutes longer has sufficient pressure to drive the engine working the pump.

POLARIZATION OF SOUND.—Prof. S. W. Robinson, of the Ohio State University, has lately succeeded in polarizing sound waves. This was anticipated some six years ago, and apparatus made for experimental verification. Last spring the verifying experiments were made by Mr. C. H. Wright, under the direction of Prof. Robinson, establishing the fact of polarization beyond dispute. The vibrations in sound waves are known to be longitudinal, and the fact of their polarization will materially modify the theory of vibration in light, they heretofore being accepted by authority generally as transversal. But if longitudinal vibrations in sound are polarizable, luminous vibrations are therefore probably longitudinal only.

COMBUSTIBILITY OF IRON.—The late Prof. Magnus, of Berlin, devised the following beautiful experiment for showing the combustibility of iron: The pole of a good sized magnet is approached to a mass of iron filings, a bunch of which readily attaches itself thereto. In this condition, being not only in a highly comminuted state, but carrying a large quantity of air mechanically entangled in the loosely aggregated mass, the iron is in so favorable a condition for combustion that the approach of an ordinary spirit lamp is sufficient to inflame it, when it burns readily, like any ordinary combustible. By waving the magnet to and fro a brilliant effect is produced from the showers of sparks thrown off from the burning metal.

FORMATION OF SULPHUR.—The subsoil of Paris contains abundance of sulphur, now in course of formation, as was recently proved in making excavations in the Place de la Republique. M. Daubree says that this native sulphur has nothing to do with the escape of gas from the mains, but that its origin is due to the simultaneous presence of various kinds of organic substances and of gypsum in the soil.

THE FUTURE OF THE TELEPHONE.—During a series of experiments made under the auspices of the French postal authorities, Dr. Cornelius Herz succeeded in transmitting audible speech a total distance of 800 miles with the aid of his telephone system.

FEVER GERMS.—Prof. Klebs, of Spragne, is reported to have discovered peculiar microbia in the remains of patients who have died of typhoid fever. They do not occur in the bodies of persons who have been carried off by other diseases.

TUCSON, Arizona, has two banks, with a capital of \$50,000 each, and agencies at Tombstone. Money commands 1 to 2% per month. Exchange on San Francisco costs 1/2% premium. Freight to San Francisco is, by express, \$9 per 100 lbs., and by railroad, respectively for first, second and third-class, \$3.50, \$3.25 and \$3; fourth-class, \$2.75, and fifth-class, \$2.50. There are about 50 wholesale stores.

ELECTRIC LIGHTS IN HYDRAULIC MINES.—In speaking of the use of electric lights in hydraulic mines, the Nevada Transcript says: Two have been in use at the North Bloomfield hydraulic mine for many months past, and piping is carried on there at night the same as by day. If necessary, all kinds of work about the claim could be done at night with the same facility as by daylight by increasing the number of lights. The expense is merely nominal. Superintendent Perkins says that electric lights for mines are a success in every respect.

A PROMINENT mine owner informs the Nevada Transcript that it is next to impossible to find a first-class miner in the camp who is not at work. He spent three days trying to hire two good men, and up to latest advices had not succeeded in getting one.

The Mining Share Market.

At last there is a sort of "boom" in stocks. One day this week 72,690 shares of stock were sold, the biggest day's work since December 9, 1880. Stocks seem to go up when once started without any special reason, and, as far as we can see, there is no cause for the present rise. A significant circumstance, however, in this connection is the rise in the Suto tunnel stock. It rose Wednesday from 1 1/2 to 2 3/4—a remarkable advance, seeing the large number of shares in the tunnel. New York rumor had it Wednesday that Messrs. Mackay and Fair, individually, are now the principal owners of the tunnel and have the control. If this be so, and it is not at all improbable, the purchase by those who know so well the prospects and condition of the Comstock mine has a world of meaning. At the Yellow Jacket everything is in readiness for operations as soon as the drain hoses are in place in the Suto tunnel. The drain hoses leading from mines have been and are still undergoing repairs. The Belcher company has closed down its old works and are but operating the pump shaft. At the Justice the 1150 level is being cleaned out preparatory to resuming active operations there. The work of sinking the Forman shaft goes steadily on with good progress. The Caledonia continues its pumping and easily keeps the mine clear of water. At the Sierra Nevada connection will shortly be made between the bottom of the incline on the 2300 level with the 2500 level, which will much improve the ventilation. The management claims that there is no truth in the report in circulation that an important development has been made, but admits that they are in favorable ground. Connection between California and Con. Virginia with the C. & C. shaft will be made before long on the 2,500 level and also with Best & Belcher on the 2,300 level which will permit of work being done in each of these mines that cannot now be attempted for lack of air. The pump at the C. N. S. shaft is not yet ready to start and those having it in charge do not state definitely when it will be. THE Blue Monday mine at Tomstone, adjoining the Boh Ingersoll, has been bought for \$15,000 by Eastern parties, who have also bought the Argenta for \$9,000.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports: Northern Belle, April 6th, \$8,304; Navajo, 12th, \$4,500; Bodie Consolidated, 11th, \$6,171; Northern Belle, 9th, \$11,153; New York and Utah, 5th, \$4,700; Ontario, 5th, \$5,590; Germania, 6th, \$2,700; Ontario, 6th, \$5,633; Horn Silver, 6th, \$5,000; Horn Silver, 7th, \$10,000; Ontario, 7th, \$5,835; Horn Silver, 8th, \$2,500; Ontario, 8th, \$6,184; Mammoth, 8th, \$1,900.

New Incorporations.

This following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco: Old Guard M. & M. Co.—April 12th. Location: Arizona. Capital, \$100,000.

**IEVADA.**  
A BONANZA AT THE BANER MIN. —*Transcript*, April 9: A bonanza was developed at the Baner mine Friday morning. The mass of the ore when pounded up yields out six dollars worth of gold to the pound. There is a peak an inch thick or more, running through it, that will pay at the rate of \$200 per ton. It will take several days to ascertain the extent of this extraordinary deposit, but judging from the locality where it was found there are very good reasons for believing that the Baner going to be one of the big mines of the district before long.

**MURCHIE MIN.** —The 600-ft drift from the new shaft shows a magnificent body of ore. A single blast made light before the ore was brought down a mass of light gold-bearing rock, sufficiently large to keep the eight stamps of the mill running a couple of days. The pump and cauldrons are being put into the new shaft, and within a few days all the ore will be hoisted through it instead of through the old incline as now. Work is being pushed ahead on the new 20-stamp battery, and the stamps will begin dropping inside of six or eight weeks. When all the new machinery is running the Murchie will be a busy place.

**LACER.**  
DITCH FLAT AND GOLD RUN. —*Placer Herald*, April 9: The Polar Star, an old and reliable hydraulic claim, at Lacer Flat, the property of A. Hayward, John Spaulding, and others, has been recently wintered and has produced good results. They have cleared up twice, realizing about 5,000 each time. They are now making the third run for the season. The ditch, also belonging to Mr. Hayward, has immense storage capacity at its head, which will enable them to run this claim nearly or quite all summer. They work from 65 to 70 men, and what is to their credit, they are all white men. Mr. Lakap has been in the mine since the first season, and has done well. Preparations are making for starting up the Elmore Hill mine, an extension property owned by the San Francisco mines. They hope to get ready in time to make at least a run this season. At Gold Run mining is being prosecuted with unusual vigor. At least 5 hydraulic claims are running in this district, and as near as we can learn they are generally doing well. Some of them are making money the season by running night and day. In addition to these there are two cement mills running in the district, one belonging to the new Gold Run hydraulic mine and the other to the Indiana Hill Co. These mills are used for crushing the lower strata of gravel which, while generally very rich, is too hard or too thoroughly impregnated to wash to advantage. The mining season at the Gold Run and Lacer Flat promises to prove a good one, and the future prospects of both districts were hardly better. The first season of the ground in these districts only took off the surface. By the aid of extensive tunnels for drainage, they are now commencing to wash the lower strata, of which there is more of the upper, and which, though somewhat harder wash, is much better in quality.

**LUMAS.**  
ANTHROP. —*Greenville Bulletin*, April 6: In this mine a 200-ft tunnel is being opened on what is known as a central claim, where they will work the Tanner ledge. GREEN MOUNTAIN. —Both mills are running regularly, 92 mps being constantly at work.

**SOUTHERN EUREKA CO.** —The mill continues running without interruption, and the quality of the rock is fully good as ever. Work in the middle and lower tunnels steadily progressing.

**PRIMUM.** —This is an old claim, situated evidently on a same vein as the old Plumas mine, some two or three miles beyond the Arlington bridge, a little off the road to Marysville, and about nine miles from Greenville. It is owned by W. Young, A. D. McMillan, and several others, and is likely soon to be worked. We learn that the company are negotiating for the purchase of a 10-stamp mill, which they propose to erect on the premises, and a mill with water obtained from the mountain above.

**INDIAN VALLEY.** —The track in the 1800-ft tunnel is all day, and ore is being run out to the mill. The latter will start in a few days, as soon as everything is in readiness to allow of a continuous run without interruption. The new company are working and surely, with a view of giving all preliminary arrangements completed, and before operations are commenced at the mill. The entire stock is owned by four persons, and their business is conducted as that of a well regulated private establishment, and the stock is not out on the market for sale.

**GOLD STRIKE.** —Never in its history has this substantial mine looked as well as at present, and from the indications likely to prove a worthy competitor of the Green Mountain. The new tunnel in the leaden portion of the mine has been struck in the rise from the first tunnel. The Wisconsin mill, with 15 stamps, will start up in a few days on ore from the Lawrence chute, which runs through the Bidwell tunnel. The 24-stamp mill running steadily on ore from the No. 3 tunnel. This mine keeps stamps in operation, and we have good reason to believe the mine could furnish abundant ore at least 100 stamps.

**A LIVELY MIN.** —Plumas National, April 9: Loring & Avitt have certainly found "the bonanza" claim of this district, and if they keep gaining as rapidly as they have, it is hard to estimate what they will take out of it. Wednesday the miners in the upper shaft picked up 100 nuggets, weighing respectively, \$100, \$50 and \$40, and the usual amount of finer gold. The returns for a week will probably exceed \$1,000. They have got the channel gold.

**COPPER ADJIN.** —We are told that the copper business to be revived again in Genesee Valley, and that a first-class mill will soon be erected to work the ore of the Cosmopolitan and Cooper mines. Just how much influence to put in the report we cannot tell, and simply let it for what it is worth. One thing, however, we do believe is likely to be true, the copper working can be made to pay, and there is copper ore enough in that section of Plumas to exhaustible quantities, and in many of the ledges a ore of a very high grade. The Light's Canyon country would also come in under the head of copper, and the copper belt can be traced through to the mountain Meadows, and possibly beyond.

**ANORVINE.** —Mr. E. A. Heath tells us that the mine is in first-class shape, and the results improving with every day's run. He has about \$200 for shipment. The power his mill is sufficient to drive three times the number of miners now running, and the new ones will be added soon as the roads are open and heavy freight can be bought in. The rock is low grade, paying about \$4 per ton, but it is easily mined and easily worked.

**MINING CHANCE.** —Mr. C. G. Rogers has assumed the proprietorship of the Cherokee mine, in connection with the Green Mountain, and Mr. E. Farlee will make his home at the Green Mountain in the future, and act as assistant Superintendent of that mine and the Cherokee.

**AN BERNARDINO.**  
SAN JACINTO DISTRICT. —*Colton Semi-Tropic*, April 9: In the San Jacinto district a company of capitalists have commenced operations, having a force of men at work. We have not been able to see any of the ore from this district, but have been told it is of high grade, both gold and silver. The country is full of prospectors and everything is lively.

**AN DIEGO.**  
PINACATE. —Dispatch from San Diego, April 12: Advice on the lately discovered Pinacate mines in this country, the San Bernardino line, show that there is considerable activity there. The San Jacinto Co. have about 300 tons of good ore on the dump, and are down 60 ft. The old Hope Co. claim to have \$40,000 worth of ore in sight. The Hoag Co. are running a drift, and taking out high-grade ore from a 10-inch vein. The Pinacate Co. are putting up a 5-stamp mill, and opening up several ledges. The Queen Co. are working a 3-ft vein, with promising prospects. About 200 locations have already been made in this district. Although placer mining has been tried on there by Californians and Mexicans for a good

while, it is only within about 3 months that the discovery of quartz ledges was made. It is said that the line of the California Southern railroad from San Diego will pass within a very few miles of these mines, and this people are building considerable hopes upon the prospect.

**SHASTA.**  
FRENCH GULCH. —*Cor. Shasta Courier*, April 9: There is quite an excitement here at present over the discovery of a very rich quartz ledge by the Gibson Bros. The ledge is situated on the divide between Saw Pitt and Summit gulches, about 5 miles from this place. The ledge shows very rich in free gold and is fully 5 ft wide. Prospects have been found along the ledge for a distance of over 1,500 ft. Several extensions have been taken that also show good prospects. Frank Wheeler is taking out some very rich quartz. The Washington Co. have just closed in a run of 132 tons that yielded \$18 per ton. Schaffer is taking out good paying quartz. Enoch & McManis are running a tunnel on an extension of the Washington.

**TRINITY CENTER.** —The mines are looking and paying well. Freethy & Coyle, of the Ella May mine, are getting big pay, and say they will soon be ready to go to French Gulch, for the purpose of looking up partners for themselves.

**SIERRA.**  
INDIAN HILL COMING TO THE FRONT. —*Mountain Messenger*: On the 21st inst. Bingham and Dixon, at the upper end of Indian hill, "lifted" a beautiful piece of pure gold weighing 38 ounces, of such purity and fineness that it will make over \$700 of United States gold coin. Several other larger lumps of the same kind were also taken out. This lucky find confirms the opinion that a rich ancient river bed courses from "Nigger tent" through Indian hill to Lager point, thence through the rich camps of Trinity Sierra to Pokor Flat.

**TRINITY.**  
TRINITY CENTER. —*Trinity Journal*, April 9: Trinity mines are paying well this season. The late rich find of Coyle & Freethy at the mouth of Hatchet creek bids fair to be a permanent mine. The hatchet is close to an ounce a day to the man. Good prospects are reported from several new claims in the vicinity.

Miners hereabouts, while still hydraulicking several hours each day, are putting in spare time cleaning bedrock and getting ready for the annual clean-up, which will close early this year.

**TUOLUMNE.**  
SONORA MIN. —*Tuolumne Independent*, April 9: The miners in the Sonora mine struck the vein on Thursday, 7th inst., in shaft No. 2, at a depth of about 50 ft. The vein, which is striped about 4 ft on top, shows very rich in gold and silver. Indications are very flattering.

**NEVADA.**  
HALL & NORCOR. —*Virginia Enterprise*, April 11: The north drift, 2400 level, has been extended 42 ft. Repairs to the incline, also the V bob, are being made.

**UNION SHAFT.** —The shaft has been sunk and timbered 9 ft during the past week. Repairing the shaft at the 1000, 2200, 2300 and 2500 stations.

**MEXICAN.** —On the 2500 level this joint Union Co. east crosscut has been extended 20 ft, and the joint Ophir east crosscut has been advanced 20 ft.

**UTAH.** —During the past week the incline has been sunk and timbered 10 ft. The ground in the bottom still continues hard.

**UNION CO.** —The Sierra Nevada joint wiazo has been sunk and timbered 12 ft, and the hoisting engine is now in operation at its top.

**CALIFORNIA.** —During the past week 465 tons of ore, assaying \$24.75, have been extracted and sent to the mills. The joint Co. Virginia east drift from the C. & C. shaft has been extended 33 ft. At the C. & C. shaft we are cutting out a hob station at the 2100 level.

**SIERRA NEVADA.** —Are equaring the station to sink the wiazo from the 2400 to the 2500 level for air connection, and are cutting out a station on the 2400 level to make a raise to the 2300 level for air connection. During the week 200,200 tons of ore were raised.

**VIRGINIA.** —During the past week 432 tons of ore, assaying \$20.20, were raised. On the 2300 level the up-raise to connect with the Best & Belcher wiazo has been advanced nine ft. Are cutting out a chamber for cooling station at the bottom of the raise. At the C. & C. shaft are cutting out a hob station at the 2100 level.

**CHERRY CREEK DISTRICT.**  
TEACUP. —*White Pine News*, April 9: The Teacup folks molded their first bar of bullion yesterday. Regular shipments will hereafter be in order from the Teacup. Between 14 and 15 tons of ore are daily run through the Teacup 6-stamp mill. Everything about it is running to perfection.

**TEACUP.** —A heavy draft was made on the miners working in the Exchange mine last Saturday. We believe this suspension will be only temporary.

**STAR.** —It is rumored that the Star M. Co. intend to put up a 10-stamp mill this summer at the mouth of the tunnel at their mine. Plenty of water for that number of stamps is available. It would make quite a saving in hauling.

**RESERVE.** —There is a reserve of over 300 tons of ore at the Star Co.'s mill, and though the mill is being run to its full capacity, the ore is still gaining.

**ESMERALDA DISTRICT.**  
EMERALD. —*Esmeralda Herald*, April 9: The Humboldt west shaft has been driven down to the level of the working well. Ex-Oov. Beahm writes from below that should the ledge continue as good as at present, down to a depth of 100 ft, a 20-stamp mill will be put up for the property at once. Supt. J. S. Mooney starts work again to-day on the New Esmeralda property. Several tons of ore from this company's mine will be crushed immediately, thus giving the public a chance to know how rich the ore really is. This is a measure in the hope of nearly 1,700 ft. and a new vein in laying in perfecting tiles, work was not commenced, as expected, last Monday on the Cortez mine, but will commence next Monday. The Centennial still continues to develop and take out first-class ore. The mine looks better every day. The Prospector is working its regular force of men. No change in the appearance of the mine. "Yaak" Gupta is prospecting the Rothelids. It looks well. Good ore is being found in the Silver Lining. The Magic is improving in appearance. The Del Monte is still shut down.

**EUREKA DISTRICT.**  
GROVES & BERTRAND. —*Eureka Sentinel*, April 8: Messrs Oliver & Salishury have been the purchasers of the Groves & Bertrand. The Sheriff's deed was passed direct to them yesterday. The consideration named in the deed is \$10,000, though it is pretty well understood that the price paid was \$50,000. Messrs Oliver & Salishury express a determination to work the mine themselves for a time before offering it to the market. They have faith that they can make it worth a million in a few months. The chances for a marked improvement are regarded as most favorable by those familiar with the property. Mr. R. D. Clerk will have charge of the mine. The first work in order will be to carry the main shaft down to greater depth, after which a system of crosscuts will be driven. All in all, the property has greater prominence to-day than any we know of in this section of the State.

**EUREKA TUNNEL.** —*Sentinel*, April 10: The Eureka tunnel has reached a length of nearly 1,700 ft. and is now within 100 ft of a point immediately under the summit of the mountain. It has been run for a long distance in shale, which, in this district, is always barren. A change has just taken place in the character of the formation, and Mr. Hartnett, the contractor, is sanguine that he will get through the shale belt within 40 ft. Once out of the shale ore bodies are likely to be encountered at any moment.

**FLOWERY DISTRICT.**  
ORE. —*Virginia Enterprise*, April 5: In Flowery district ore is being reduced from the old upper levels and

croppings of the Lady Bryan mine, from the Monte Cristo and from one or two other veins, keeping 8 or 4 water mills in operation. Through working in this way in Flowery they are able to get on the right track, and keep on it till the first they know they will one of these days tumble into a first-class bonanza. The old plan of working in that section was to get good prospects on or near the surface, then go away from the spot as far as possible and start a big shaft or tunnel, taking the chances of finding that which they should never have lost sight of.

**LIDA VALLEY DISTRICT.**  
RICH. —*Esmeralda Herald*, April 9: Rich ore has been struck in the Centennial mine, at Lida Valley. This mine is considered one of the best places of property in southeastern Esmeralda. The Andrews & Scott 5-stamp mill is running steadily on ore from the Centennial mine, owned by Peter Anderson. The old Lida Valley mill is undergoing repairs and will soon be in running order. A 30-ton test is to be made on ore from the Lida Belle mine as soon as the mill is ready. John Chiatovich, acting agent at a new well district, has several mines in Silver Peak and Palmetta districts, and put several men at work on the company's mines. The company mean to open up their properties and see what there is in them.

**MONTEZUMA DISTRICT.**  
FURNACE. —*Esmeralda Herald*, April 9: John Howell is erecting a smelting furnace, at Montezuma, with a capacity of 15 tons. He has let a contract to parties there to furnish 25,000 bushels of charcoal. A few men are prospecting the mines of Montezuma district.

**SILVER CANYON DISTRICT.**  
SILVER CANYON. —*White Pine News*, April 9: From Charley Sommerholt, just in from Silver canyon, we learn that the mill is shut down at present, but will start up again in about two weeks for a good run. A force of 50 men is to be put on the Blue Belle mine as soon as the snow goes off sufficiently to permit hauling to the mill. Two bars of bullion were shipped from there by Thursday's stage. Charley thinks the camp will be in good news this summer.

**TYBO DISTRICT.**  
TYBO MILL TO START. —*Eureka Sentinel*, April 8: The Tybo mill is to be started up the present week. It is hoped to keep it going in the future. Mr. English did not sell the property to New York, but will soon add some new capital and increase the crushing capacity of the mill to 100 stamps; so he informed a representative of the *Sentinel* a few days since. The mine abounds in low grade ore, and may be worked at a handsome profit with increased milling facilities. Better times, we hope, are in store for those who have stuck by Tybo.

**WHITE PINE DISTRICT.**  
MADRE CONNECTION. —*White Pine News*, April 8: On the 31st of March connection was made between the Eberhardt tunnel and incline. We learn that the people of Hamilton and Eberhardt "jubilated" on the occasion. Those White Piners are hopeful people; they never give up; they believe that Treasures hill yet has millions in it; and now that the tunnel is completed and good ventilation secured, Capt. Drake will direct all his energies to the work of discovering a bonanza.

**ARIZONA.**  
PIONEER DISTRICT. —*Pinal Drill*, April 9: Big strikes on the Belcher. —Strikes on the Pike tunnel. —Fine ore found on winz No. 3 of the Lewis. —Silver Duke is stopped on account of water. —On the Emma they have spent about \$10,000 in developing the incline shaft. —The Emma. The tunnel is 100 ft long and strikes the shaft at a depth of 80 ft. At the bottom of the shaft they have drifted along the vein for a distance of 60 ft. The vein is 3 to 4 ft wide, carrying copper, galena with silver. The owners are Duff, Gorham and others. —The Bebee is about 7 miles southeasterly from Pinal, on a good natural road. This remarkable mine has the top of its main vein exposed in the incline shaft, scarcely covered by the drift, and there it lays for a length of about 1500 ft, so that stopping can be done from the ft of the mountain. There is some work done to show the value of the ore, which is carbonate and galena in a formation of syenite and porphyry. The width of the vein is 5 ft, and more, on the top.

**GLOBE DISTRICT.** —*Arizona Sentinel*: Our mills are doing good work at present. —The Mack Morris is running steadily and making regular shipments of bullion. The Stonewall Jackson is also doing steady work on the rich ore body found in the lower level.

A Mexican was in town last Sunday exhibiting a nugget of gold weighing 6 ounces, for which he was offered \$80. It was found in the placers of Lost gulch, about 2 miles west of the Golden Eagle mine. He says that one can easily make \$6 a day in that locality by using a common sluice box.

Mr. W. B. Hellings is pushing work on the South Pioneer mine, in Mineral Creek district, with a full force of men. He proposes to ship his ore to San Francisco, which is *prima facie* evidence of its high grade. The shaft is down to water, and he proposes to put in a large steam pump as soon as practicable.

**NOBLE FROM GRO BLANCO.** —*Arizona Journal*, April 9: Mr. E. M. Thayer came to Tucson yesterday from Oro Blanco. He reports the mining prospects in that district as looking very well. There is not much gold just at present, owing to a scarcity of water. The Washaw mill has shut down because of this scarcity. In Old Gro Blanco they get water at 12 ft, but in the new portion of the district they have not yet made an effort to secure water by sinking. The gold mines are turning out well, and they get considerable gold by panning.

**SOUTHERN CALIFORNIA.** —*Arizona Journal*, April 7: Mr. Campbell has returned from a flying trip to Tombstone and Charleston. He reports the Sulphuret as booming. The water on the 500 level is perhaps a greater find to many of the miners than the splendid body of ore which has been disclosed. It is about eight ft deep, and can be utilized for mining purposes, and it is within the possibilities that this had settled the vexed question of an inexpensive and inexhaustible supply of that very necessary fluid. Mr. Campbell says the town of Hereford is making rapid progress. They are burning brick for the reduction works to be erected there, and the narrow gauge railroad, or rather the line for it, from Hereford to Bisbee has been staked out, and it is proposed to commence its construction immediately. The Neptune company has made another splendid copper strike in Montezuma canyon, and the company now intends to extend the railroad to that point.

**COLORADO.**  
FINE CRACK. —*Register-Call*, April 8: Kelley & Co. have tapped in the breast of the adit on the Setting Sun lode, in Enterprise mining district, a fine vein of both smelting and concentration ore.

**FOOT OR GR.** —The 50-stamp mill of the United Gregory Co., since its being remodeled, is full of ore. Six 5-stamp batteries are double issue, the remaining 4 being single issue.

**WORK.** —Work is to be resumed on the S. P. Chase lode, in Russell district, by one of the owners of the mine, who lately arrived from the East.

**ORE.** —The Con. Kansas mining company, Nevada district, are running 20 stamps of their mill on ore from the Kansas mine.

The owners of the Blue Diamond lode, Central mining district, are making arrangements to build a shaft-house over the working shaft.

**IDAHO.**  
A TRAW AT WOOD RIVER. —*Eureka Sentinel*, April 8: The latest dates from Wood river represent that the weather has been very warm and pleasant, and that the snow is melting so rapidly as to create a flood. Many gulches and creeks, and dry dry in summer, are converted into small rivers, which are difficult to ford or cross. In consequence, communication between the various towns is almost entirely broken. With good weather it is thought that the body of the snow will have disappeared by the 1st of May, up to which time it would be folly to start for the new El Dorado, except for those who know how to swim.

**LIVELY.** —*Yankee Fork Herald*, April 4: The fact that all of the mines of the Salmon river country are developing finely will soon create a boom that will not only be a big one, but permanent. Of all the mines that have been worked on during the winter there is not one but that looks and prospects much better than over before. The Yankee Fork is a great mining country, and we can safely say that, although it has been highly spoken of both in the East and West, it is even greater than those who have the least waited it suppose. There is enough ore now in sight to justify the erection of a dozen 20-stamp mills, and a general opinion is that several will be erected this year. As soon as the weather will permit experts to examine the mines some sales will undoubtedly be made, and Yankee Fork and Wood river will be the liveliest mining camps on the Pacific coast.

**WOOD RIVER.** —*Silver State*, April 3: L. A. Hall, Wells, Fargo & Co.'s route agent, passed through yesterday, on his return from Wood River. He said he got as far as Little Wood river, some 35 miles from Bellevue, but as no streams were running, in consequence of high water and bad roads, he had to return without getting to the cad of his journey and establishing an office at Bellevue. He says there are over 100 persons from different parts of the country at Blackfoot, awaiting the opening of the roads to the mines. He expresses the opinion that Wood River will equal, if it does not excel Lida Valley.

**MONTANA.**  
ANSELMO. —*Inter-Mountain*, April 10: Two years ago the Anselmo was hardly entitled to be called a prospect. A small incline shaft was sunk on the vein, showing a small body of ore of two grades. With a small force of men the sinking of the incline shaft was resumed, and when the incline had reached a great improvement was noticed in the richness and character of the ledge. At a depth of 70 ft the ore body was 2 ft wide and sampled 150 ounces. At this point drifts were extended east and west, which showed the vein to be regular, the walls well defined and the ore of a uniform richness. The value of the property thus being established, a whim was erected to facilitate development, and preparations were made to start another shaft 100 ft east. The amount of ore available for extraction is very large, and the mines are now being actively worked. The daily output is 15 tons. The ore is a black sulphuret, carrying native silver in profusion, and is being shipped to the Silver Bow mill for reduction. On this dump are 500 tons of ore, of which 300 tons are first-class, which mills \$275 according to certificates, and 300 tons of second-class ore assaying \$80, but which is not being worked at present. The Anselmo is now in splendid shape to insure a heavy and constant production. It has already produced over \$200,000.

**MOULTON.** —The gallows frame for the new hoisting works on the Moulton is about completed and will be put in place this week. When finished they will be the finest and only works of the kind in the Territory.

**HONOLULU.** —Work still goes on in the Honolulu. A contract was let this week to sink the main shaft to a depth of 75 ft. When this depth is reached a level will be run east in the vein. Some very rich ore was struck on Monday. The work is being done under the supervision of D. R. Beck and P. J. Conway.

**BOULDER.** —*Butte Miner*, April 3: The Boulder G. & S. M. Co., of Loganport, Indiana (at Butte City), is developing its property with great energy, having a full force of men working day and night. Large and valuable ore bodies are already exposed.

**MOULTON.** —The large 5-compartment main shaft of the Moulton mine last night had reached a depth of about 270 ft. A large force of carpenters is employed. Some are busy dressing timbers for a large "How's Truss" gallowa frame, the largest and only structure of the kind in Montana.

**BLUES WING.** —A Blue Wing, Beaverhead county, correspondent writes of a big strike in that district, as follows: "We struck his tunnel 155 ft under the mountain, has struck a tremendous body of rich ore, which the formation running north and south come together. It is a bonanza—the biggest thing struck here for a long time. Over 20 ft of an ore body is found in the contact between the lime and granite. The ore is rich and is what is termed 'antimonial silver ore.'"

**LEXINGTON.** —A superior quality of ore is hoisted daily from the old incline shaft at the Lexington mine. Work of extracting ore from the east level goes on regularly. The quality is first rate, and the quantity lifted daily averages about 16 tons.

**ALICE.** —Operations at the Alice mine, in all the workings, progress entirely satisfactory. No sensational developments are reported. In all the upper levels of the mine, from the 500 level up to the 100 level, the drifts and stopes are being energetically worked, and are producing an average daily output of ore, reaching about 30 tons. The ore coming out is dumped into the 20 and 60-stamp mills, mixed into suitable proportions for successful treatment, and comprising the different grades of ore found in the mine.

**BELL.** —The Bell mine is yielding about 30 tons of high grade ore daily, and there is no call to increase the yield at present.

**THE GREEN FLAG.** —The Green Flag mine is producing from 30 to 40 tons of ore daily, which is hauled to the Colorado smelter for reduction.

**THE GREEN FLAG.** —The Green Flag mine, located near the Dexter mill, has a good vein of ore opened that assays over 100 ounces of silver to the ton.

**NEW MEXICO.**  
SAL. —*Grant County Herald*, April 9: Some pretty heavy sales of Shakespeare mines have recently taken place, the most important being of the Superior mine. Jas. Carroll has sold a half-interest in this mine for \$75,000 cash, the purchaser agreeing to put in \$50,000 worth of machinery in addition to the purchase money. Of this machinery a 50-ton smelter is to be erected at Shakespeare, the site of the main reduction works not having been determined. The purchaser is the Merchants' National Bank, of Evansville, Ind.

**LONE MOUNTAIN.** —Wm. Brahm has an essay from his St. Paul mine, Lone Mountain district, which shows 710 ounces to the ton. The sample assayed was picked up from a 10-ton dump pile. We hear that eastern parties are now negotiating for Brahm's property at Lone Mountain, and that a sale will probably be effected.

**OREGON.**  
DITCH. —*Democratic Times*, April 3: From W. J. Savage, of Rogue river, we learn that work has been resumed on the main ditch that will run from a branch of Savage creek to some diggings near the residence of his father, which are supposed to be quite good. Savage Bros. are enterprising miners and discerning speculators. Savage, Jr., of Grants, Co. of Forest creek, was in town Saturday, who informed us that the miners of that section have stripped more ground than ever this season, and expect to do well.

**PROSPECTING.** —Anderson & Cook have been prospecting on Prairie flat with good success, having taken out \$6 and \$7 a day on several occasions. With a fair supply of water they could make out a large amount of gold.

**NOYES.** —Cleaning up is becoming general. The mining season will close earlier than usual. A larger area of ground than usual has been stripped this season. Dan Silva is now cleaning up at the Applegate Gravel Co.'s diggings, and good results are anticipated. Some partial clean-ups have been made at the Sterling mine, which are said to have resulted very satisfactorily.

**GRAND.** —Frank Hill left for Grand creek yesterday, to look after the interests of the English and Blue Gravel companies.

**ELLIOTT.** —Tom Brown reports that the miners of Elliott creek have done substantial work in spite of the freshets, and are now cleaning up.

**BAD.** —The much-looked for April showers are dilatory, and many of the miners will be unable to finish cleaning up this season in consequence.

**DITCH.** —Jas. McDougal will soon commence building a mining ditch from the head of the big bar of Rogue river to the old quartz mill site some distance below.

## Copper Smelting, Etc.

(CONTINUED FROM PAGE 242.)

## The Age of Bronze in Europe.

But did it commence in Europe? The best authorities say "No," and I think they establish their case. It is almost certain that the use of bronze was introduced from the East, either as a branch of commerce, or, as seems more probable, by the incursion of a powerful and warlike race, large in stature and better armed than the men of the stone age, who were consequently speedily extirpated by them. This inference is drawn from the bones found in bronze age tumuli. Prof. Rolleston tells us that "Hesiod (who is supposed to have written about 900 years B. C.), in his 'Works and Days,' had somehow become as much impressed with the vast size and brute strength of the bronze-using people as I have become from actual handling of the bones." He also says, "All this seems to me to point to a conquest of this country having been effected by bronze-using invaders, who came in great numbers, probably, as has been elsewhere suggested, from the Cimbric peninsula." The relics of this race prove that they were a people of higher civilization than the men of the stone age. During this age, true bronze alone is found; that is to say, an alloy of copper and tin; during the Roman period, lead was frequently introduced into the alloy, but during the same period bronze was not used for the manufacture of weapons or cutting implements; iron and steel had taken the place of bronze in the manufacture of swords, spear-heads, and the like.

It now becomes an interesting question to consider, whether, during the bronze age, the materials of which it was made were produced in Europe or imported into it? Sir John Lubbock says: "The impurities in the bronze indicate that the copper ore was not all derived from one locality, and lastly, the discovery of molds in Ireland, Scotland, England, Switzerland, Denmark, and elsewhere, proves that the art of casting in bronze was known and practiced in many countries. Under these circumstances, it appears most probable that the knowledge of metal is one of those great discoveries which Europe owes to the East, and that the use of copper was not introduced into our continent until it had been observed that, by the addition of a small quantity of tin, it was rendered harder and more valuable." It seems almost certain that Europe, at least, never passed through a copper age. Implements of pure copper are extremely rare; a few have been found in Ireland. Some of these are of doubtful composition, and one is supposed to have come from America, where, undoubtedly, an age of copper did exist. That, however, is explained by the massive deposits of pure copper which occur on the shores of Lake Superior, which bear evidence of extensive and very early working. The remarkable similarity of bronze implements, wherever found, is an additional proof of their early importation, and that they came from a common center of manufacture, although the existence of molds in various countries, as before mentioned, shows that the implements were also cast in those countries, probably to meet the special tastes of the persons who were rich enough to buy them; the manufacture was probably carried on by recasting bronze ingots brought from their distant source of production. This seems strange and contradictory in view of the existence of copper and tin in such abundance in Cornwall; but we have the distinct evidence of Caesar that even in his day these islands imported their bronze, in the often quoted words, "*Ære ventur importato*." Further, I am not aware that there is any record or remains of very early copper smelting in Cornwall, or elsewhere in England. I do not speak of Roman days; for I believe there is some slight evidence of copper smelting in the north of England in Roman times; but I speak of the times of the true bronze age—the men of the "round," "bell," "howl," and "cone" shaped barrows in which bronze, and not iron, is found.

(TO BE CONTINUED.)

## UNITED EFFORT FOR FROST PROTECTION.

The viticulturists of the St. Helena district are moving together to raise a cloud of smoke over their whole area when the thermometer falls threateningly low. At the last meeting of their club a committee was appointed to arrange for the united effort. All are to apply matches to the previously prepared piles of combustibles when the cannon is fired at the place of Mr. Krug. This is a business-like way of going at the problem, and we doubt not it will succeed. In case others may like to know of the materials to be used, we may note that the report of the meeting in the *Star* says that heaps of straw manure with grape brush are to be used, the fire to be kept smothered so as to send out volumes of smoke. Mr. Weinberger is experimenting with what they call "smoke cakes" in Germany, made of two-thirds sawdust and one-third coal tar (by weight). These when ignited make a heavy and effective smudge.

A few men have been placed to work in the Mayflower mine, the property of the Bristol S. M. company, by the Superintendent. This mine is under attachment and the men have been put to work against the wishes of the attaching creditors. It is very probable that again the month of May blossoms the affairs of the Bristol company will all be settled, and a force of miners placed to work.

## Irrigation Engineering.

Those who are familiar with the irrigation work planned and being carried forward by the State Engineer Department of California, cannot fail to appreciate its usefulness and wish it continued success. Interested in all measures calculated to advance the agricultural interests of the State, we have taken pains to make careful inquiry into the nature of the work performed in the past and that planned for the future, and make a few notes thereof for our readers.

It needs to be understood in the first place, that the department is divided into two distinct branches, one of which has for its work the engineering required in carrying out the public improvements under the "Debris Act;" the other, the investigation of the physical facts involved in the irrigation of our valleys. Their objects are thus diametrically opposite—though not conflicting—the one aiming to prevent overflow and drain a region of an excess of water, the other to supply arid lands, otherwise useless and uncultivable, with the water of which they are so deficient.

The support of these two branches of engineering is as distinct as their work; the one depending upon the funds levied by taxation and the debris act; the other maintained by direct appropriation as all other departments of the State are supported.

It is the irrigation branch of the Department in which we feel most interested, and to which we wish to direct attention. The objects aimed at in the irrigation investigation are briefly to ascertain by observations conducted through a series of years, the average volume of water discharged by the streams available for irrigation; to learn the extent and character of the land irrigable from each source of supply throughout the State, and the nature of the soil and subsoil with reference to their adaptability to irrigation. These soil studies are especially useful, and are outlined upon detailed maps of large scale which show the boundaries of the various classes of soil, the exact topography of the country, the ownership of land, position of all prominent objects, etc. In short, these maps, made up by direct examination of the ground and from all surveys available, are designed to be much fuller in detail than any of the county maps heretofore published, and while not pretending to the minute elaborations of the famous maps published by the Ordnance survey of Great Britain, which has been in progress for a century, they will, when published as they are intended to be, come nearer to them in the amount of information conveyed than anything a young State like California has ever before projected. These sheets, which are intended to cover first the irrigation districts of the State, will ultimately be carried over its entire agricultural area.

A map of the entire State, on a smaller scale than these detail sheets, is making rapid headway in the office, and will probably be ready for publication in 1882. This map, which is designed to be sold at cost price after publication, is expected to be as complete and accurate as it is possible to make a map with the information available.

The nature of the irrigation systems practiced in various parts of the State is being studied and compared with special reference to the quantity of water required under various conditions and any observed defect in any section tending to produce a partial failure in irrigation, whether arising from physical peculiarities of soil and climate, defective works, or defective laws and regulations, are made a subject of inquiry, with the design of pointing out the remedy and promoting the interests and extending the practice of irrigation throughout the State.

That a greater degree of interest is being awakened in California in the necessity and value of irrigation is apparent to every observer, and we know of no public work undertaken by the State of greater general value than the investigation conducted by the Engineering Department. We understand that it is the intention two years hence to prepare for publication a complete treatise on the subject, which shall be elaborately illustrated and embody a review not only of all that has been learned of irrigation in California, but a comparison with all the prominent irrigation works of the outside world, compiled from the latest sources of information. We trust that the importance of this work will be so fully appreciated that the appropriation given in support of this important department of State work at the present session of the Legislature, will be sufficiently liberal to carry it forward to an early completion.

FROM SILVER (AURUM) CANYON.—Jno. L. Robertson, Wm. Borthwick, Wm. Pryde and Geo. McNamara came over from the canyon Thursday. They say the mill has been shut down. The Blue Bell mine had not been reached at the time they left. The snow between this mine and the mill is about 30 ft. deep. The last run made by the mill was on ore of a high grade, and a substantial clean-up is expected. The ore so far worked has been taken from the Sadie L., which, though carrying some wonderfully rich ore, is considered nothing more than a prospect, so the fate of the camp cannot be said to depend on that mine. Two hundred tons of ore is said to be on the Blue Bell dump. —*Ward Reffer.*

## Wheat Shipping.

The shipping of California wheat to Europe has been progressing at a rapid rate during the last three months, and the amount of wheat and flour sent out during the first three quarters of the harvest year is larger than that shipped during any whole year preceding. The deliveries of flour and wheat at San Francisco from July 1st to April 2d compare as follows:

	1879-80.	1880-81.
Flour, qr. sks.....	1,489,700	1,765,400
Wheat, centals.....	10,506,000	13,087,500

Reducing the flour to wheat, we have the equivalent of 14,411,600 centals wheat this year to date, against 11,622,300 centals for the same time in the previous harvest year. Although this large amount has been sent out, there is abundance still remaining, and there are about two score ships now in port under charter to carry wheat. Thus our magnificent crop of 1880 is working off and will be well out of the way before the crop of 1881, which promises to be also immense, will be ready for the ships. There are certain points concerning the prospective carriage of wheat which are of great interest at this time. One is that San Francisco is in imminent danger of losing some of its prestige as a wheat shipping port, because of the heavy burdens which are laid upon ship-owners by the port regulations, etc. San Francisco has the reputation of being the most expensive port in the country to bring a ship into. This is unfortunate, because it ultimately works disastrously to our wheat growers who should certainly find nothing in the way of the cheap export of their grain. The Southern Pacific railway authorities announce openly that they intend to carry wheat eastward to the Gulf of Mexico, and many of the growers of the San Joaquin valley are looking forward to the time when their grain shall not come near San Francisco bay at all. Such a result would be no more than fair return for the restriction placed upon shipping here by the great cost of this port. But we are fearful lest a turning away from San Francisco may ultimately place the business so far in the hands of the railroad that there may be no more healthy competition between ship and rail which will prevail at first. It is an encouraging fact, however, that there seems good reason to expect a large fleet of wheat ships in these waters the coming season, as reports have already gone forth that another year of large production is foreshadowed. It is believed that the present tendency to use steam instead of sail in the short voyages between European ports, etc., will throw a larger number of sailing vessels upon the Pacific ocean for cargoes. The progress of the change from sail to steam is worthy of note. In the report of the Oregon wheat growers' meeting last month, it was shown that the shipping interest of each and every maritime nation shows a decadence in the number of sail vessels. The largest maritime nation, Great Britain, is a fair exponent of this. She has lost within the past three years over 500,000 tons register in sail vessels, and gained over 1,000,000 tons register within the same time in steamships. She enters this year with contracts for building a larger number of steamships than ever before, and whose average registered tonnage is very largely increased over any former year, very few going below 3,000 tons, while many run over 7,000 tons; for it has been demonstrated that the larger the steamship the more profit received. Norway, which had a fleet in 1879 of 7,982 sailing vessels and had only 306 steamships, added quite heavily in 1880 to the number of steamships with more being built and others to follow. While she has been building steamships she has not added to her sailing fleet, as it was demonstrated that steamships could be constructed so as to carry lumber cheaper than sail vessels. France has enacted a law offering a bounty to French owners building steamships in France, and therefore it is morally certain that a very largely increased number of steamships will be built in that country.

So long as we can have plenty of ships and a competing route to the Gulf of Mexico, California can produce wheat to advantage. It is when some of the several go-betweens which separate the producer and consumer arrange for an unfair amount of profit for themselves, that the price falls so low that the industry is threatened.

## REDUCTION OF SILVER IN CHARCOAL.—Dr. C.

F. Chandler mentions the following interesting item in connection with the reduction of a silver salt by glowing charcoal. When solid nitrate of silver is placed upon glowing charcoal, deflagration takes place, the result being that the silver is left behind in the metallic state. Dr. Chandler has noticed a curious phenomenon attending this reduction—namely, that the nitrate in being fused by the heat, sinks into the pores of the charcoal, and as each particle of the latter is replaced by the reduced silver, the structure of the original wood is retained. Dr. Chandler affirms that in this way he has succeeded in producing masses of silver weighing an ounce or more, which show most beautifully the rings of annual growth of the wood. In performing the experiment, the author recommends that a crystal of the nitrate be placed on the end of a stick of charcoal, and the blow-pipe flame be directed upon the coal beside it, to start the reaction. As soon as deflagration sets in, crystal after crystal of the nitrate may be added.

## A State Entomologist Wanted.

At the last meeting of the State Horticultural Society, Dr. Behr spoke of the necessity of having some authorized officer to whom the decision of disputes between the farmer and insect-pest officer could be referred.

Mr. Hatch suggested that some expression of opinion on this subject to the Legislature, in view of the coming extra session, would be appropriate.

The following resolutions were read and adopted:

*Resolved*, That it is the conviction of this meeting of the Horticultural Society that the services of a competent entomologist are required to give a proper effect to the provisions already made by the Legislature with a view to exterminate insect pests, which are rapidly destroying the orchard interest.

*Resolved*, That it is desirable that a professor of entomology be attached to the College of Agriculture.

*Resolved*, That a committee of this society be appointed to confer with a committee of the Regents of the University, with a view to bringing this important matter before the extra session of the Legislature, and securing, by an amendment to the Appropriation bill, a sum sufficient to provide for a professor of entomology at the State University.

*Resolved*, That all kindred horticultural and viticultural societies throughout this state be requested to unite their efforts and influence with us to secure the desired result.

The Chair appointed as the committee suggested in the resolutions, J. V. Webster of Fruit Vale, S. F. Chapin of San Jose, and W. H. Jessup of Hayward.

Prof. Hilgard and Mr. Hatch spoke of the establishment of a Chair of Entomology as really of more importance to the success of this law than anything else proposed.

Mr. Jessup said that it was very necessary, and the only reason it was not incorporated in the original bill was because they feared to defeat the whole proposition by asking too much and leaving open a chance for the objection that they were seeking to have too many fat offices created. Having got so much secured, he thought it could do no harm now to ask for this rest that they desired for the efficiency of this law, viz., a State Entomologist.

Prof. Dwinelle said that he thought \$2,400 a year would secure the services of a trained and practical economic entomologist from the East. Besides that it would need about \$1,000 a year for necessary expenses and \$100 for plates, and that \$3,500 could not be more advantageously invested for the general good and the advancement of a most important interest.

Mr. Webster said that a grave question arose as to whether the Legislature at the special session could appropriate money for an office not already created.

Prof. Hilgard said that it could only be done by appropriating an additional sum for the College of Agriculture, to be used for the purpose indicated.

Mr. Shinn said that the Legislature could lawfully appropriate money for any purpose which had already been made the subject of legislative enactment, but if it was new matter they could not.

## Soured on Stocks.

The boys were sitting around in Vic. Muller's saloon, talking about the hard times, and of course their conversation drifted into the stock market, and the Carson *Appeal* reporter untied his ears and took notes.

"Don't talk to me about stocks," said a little red-headed man. "If a man was to give me a point in the d— strap game I'd hit him right on the nose. I've swore off."

"That's the business," said another approvingly.

"Ever since I came to this country," said the first speaker, "I've been luckin' at the gams right along, loein' all the while. Stock dealin' is the slickest combination ever cooked up to rake a man's pocket. Highway robbery's not a circumstance. If I was to go down into Sierra Nevada and see a crosscut 200 feet long runnin' slap bang into a solid body of gold 999 fine and when I came out if a man was to offer me a thousand shares for my old hat here, bust me wide open if I wouldn't belt him on the head with a brick and freeze to the hat. If I ever get taken in again it's my fault."

The red-headed man walked off, leaving the crowd much impressed, and at the corner he overheard a man say to another:

"She's a huy; you bet your boots she's a buy."

"What's that?" said the hear, pricking up his ears.

"I was just sayin' that Sierra Nevada was a buy."

"Really think so?"

"The boys are taking in all the stock they can get on Pine street."

"You don't say so!"

"Fair's got control of the tunnel!"

"The devil!"

"Mackay's coming back from Europe."

"Holy Moses!"

"They've run a diamond drill into the two thousand, and she's richer'n hot mush. The true business rolled in sand. This is dead square—"

The red-headed man heard no more, but in a few minutes he was in a lawyer's office getting him to fix the papers for a mortgage on his house so that he could take a thousand shares on a margin before the next Board.

The Martin White company has acceded to the demand of the miners for \$4 a day. Superintendent Sweetapple informs us that the company had decided upon taking this course before the demand was made.

## THE ENGINEER.

## A Mammoth Engineering Project.

Lake Mackenzie is one of those "possibilities of North America" recently suggested. The lake would result from a proposed closing of the northerly outlet of the valley of the Mackenzie river, at the line of 68° north, and storing up the water of 1,250,000 square miles. And to this could be added the water of other large areas. It would be a lake of about 2,000 miles in length by about 200 of average width. Its surface would have an altitude of about 650 ft. above sea level. It would cover with one continuous surface the labyrinth of streams and lakes which now occupy the Mackenzie valley.

It would be a never failing feeder for the Mississippi. It would connect with Hudson bay and with the "great lakes," and also with the interior of Alaska by connecting with the Yukon and its affluents. By concurrent results and other "possibilities," it would become, during some months of each year, a navigable water, adding not less than 12,000 miles of communication to the Mississippi. It would complete the interior lines of river courses by connecting them.

Cutting the "divide" which now exists between the Mississippi and Mackenzie would do this. This work is small when measured by its results, and it becomes easy of accomplishment under the methods proposed. The connecting of the upper Mississippi with the proposed Lake Mackenzie could be easily made. The out-flow from such a lake, having a length of more than 2,000 miles from south to north, and draining a very wide range of altitudes and latitudes, would be a timely and enduring one. This lake would make possible and easy the straightening of the lower Mississippi. It would also contribute to the proposed ship channel from Cairo, Ill., to the Gulf of St. Lawrence, by the almost straight line which cuts the Wabash valley, the lakes Erie and Ontario, and the lower St. Lawrence. This commercial channel, receiving all the waters converging at Cairo, would complete the demand for a constantly open ship channel from the St. Lawrence to the sea by way of the Strait of Belle Isle. That demand can be complied with, and the shortest and best line of communication can be thus opened between the interior and the seashore.—*St. Louis Republican.*

**THE ARMBERG TUNNEL.**—The preparatory operations having been finished, the work of boring the great tunnel through the Arlberg has now actually commenced. This tunnel will be one of the longest in the world, though not so long as that of St. Gothard. So far the operations on the eastern side of the Arlberg have progressed very favorably. The rock there found is a micaceous slate, through which the contractors find it possible to advance at the rate of from three to four meters a day. On the western side, on the other hand, the advance of the tunnel is retarded and the operations frequently disturbed by the repeated downrush of large quantities of water. The contractors were warned before commencing the work that this was only to be expected. The geologists further advised that the tunnel should be carried through a lower stratum of rocks, which are of denser material and water tight, but their warnings were unfortunately disregarded.—*Swiss Times.*

**THE ISTHMIAN CANAL PROJECT IN 1521.**—Anyone who thinks the idea of a canal connecting the Atlantic and Pacific a new one is mistaken. As long ago as 1521, a Portuguese navigator, Antonio Galvao, proposed to Charles the Fifth to make an interoceanic communication by the Panama route, and in 1780 Nelson proposed a canal through Nicaragua. Von Humboldt took it up in 1804. The first work actually done was in 1841 by Henry de Puydt, who moved a colony to Honduras to dig a canal. This colony went the way of so many that had preceded it. A few years later Garilla and Cortinez were sent out by Guizot to study the matter, and pronounced the undertaking an impossibility. About the same year Louis Napoleon was solicited by the Nicaraguan government to lend his name to the undertaking, and did actually make an appeal to the public in a pamphlet entitled "Le Canal de Nicaragua." Thus it is that the isthmus has received a pretty fair pavement of good intentions.

**TUNNELING THE PALISADES.**—The tunnel through the palisades at Weehawken, for the New York, Ontario and Western railroad, is again in progress, after a temporary suspension on account of a slight deviation from the original survey. The cutting is through solid rock and is for a double track, the whole work to be finished within a year. Mr. Katta is the engineer in charge.

**SEWER IRRIGATION.**—The experiment of irrigating lands in the neighborhood of Paris, with water from the sewers, is said to be working successfully. Sterile tracks of land have been converted into fertile plains, while no increase in sickness among the inhabitants has followed, as was apprehended.

**TWENTY steel floor beams** have been laid on the Brooklyn side of the great East river suspension bridge, affording some conception of the future appearance of the finished structure.

## USEFUL INFORMATION.

## Wool-Velvet.

An extremely novel and interesting process has recently been discovered by M. Puech, of Mazamet, France, by which the wool on sheepskins may be transformed into velvet. Up to the present time sheepskins tanned with the wool on have only been used for mats, linings of coats, etc., and the wool not having been subjected to any preparation, is always matted or curled. Seeing that the innumerable fibers are naturally disposed in a most regular and perfect order, eminently fit for velvetting, M. Puech, conceived the idea of cleaning the skin and wool of all impurities, and of so preparing and dressing them that the hairs would be well preserved and not entangled one with the other, the occurrence of the latter contingency being, of course, fatal to the success of the operation. After long and continuous experiments success has been achieved in the following manner. The *modus operandi* is divided into ten principal operations, the first, second, third and fourth relating to the complete scouring of the skins on the wool side and cleaning them on the flesh side, and the fifth, sixth, seventh, eighth and ninth to tanning and preparing the skins so that the perfect adherence of the wool to the skin is insured; finally by the tenth operation the skin is submitted to special machines for preparing the wool like velvet.

The following are the ten numerically arranged and successive operations referred to as constituting the process:

1st. An ordinary water bath is prepared at a temperature of from 45 to 50 degrees centigrade, to which a scouring substance of some sort is added, such as crystal or soda salt, soap and so forth, in which the skins are steeped.

2d. If dry skins are operated on, such as come from America or other foreign country, they are steeped eight to ten minutes, but for fresh or recently slaughtered skins, three or five minutes will suffice. The skins are then passed to a pressing roller of sufficient power to separate the hurs, yolk and other impurities.

3d. The skins are then as quickly as possible, and while still warm, submitted to a heating machine of some kind. The object of this operation is to heat the skins to purify them of all foreign matters, and at the same time wash them thoroughly with cold, tepid or hot water, which is made to fall in abundance between the drum of the machine and the apron supporting the skin.

4th. The skin on the flesh side is then passed to this same heating machine, which cleanses it, renders it more supple, and disposes it to receive the tanning matter.

5th. The skins thus prepared are steeped about one hour in tepid water, or four to five hours in cold water, which operation completes the softening.

6th. They are then passed to a pressing roller to extract all the water and leave 15% to 20% of moisture.

7th. On the flesh side is applied, either by hand or mechanically, one of the known drugs composed *ad hoc* constituting the tanning matter. In order that the action on the leather may be complete the skins are placed in piles for five to ten hours, after which they are hung up to dry.

8th. The leather is now moistened with a rag or sponge, and the skins are replaced in piles for 5 to 10 hours to soften the leather and permit of cleaning the flesh side.

9th. The hides are stretched and then passed to the softening iron, always on the flesh side, and the skins are scoured and tanned.

There now remains only the 10th, or velvetting operation, which is effected thus: By the scouring and heating system the staple of the wool is perfectly preserved and each fiber is in place. It then suffices to pass the skin on the wool side to the gig machine, which replaces all the staples where they had been displaced in the tanning operation, and cause the skin to part with what little tanning drug it may contain in the wool. After this the skins are passed to the dressing machine, which commences to dress the wool, cards it also a little and prepares it for velvetting. The skin on the wool side is then gently sprinkled and heated with a rod by hand or mechanically. This is one of the most essential operations, as the wool being then damp the rod raises it and hastens the preparation of the velvet.

The skin has now to be dried and sheared with cloth shears or other apparatus having the same effect. The skin is then the velvet skin or sheep's wool velvet, the subject of this invention. If it is desired to color the velvet, it is after the fourth operation that the dyeing takes place, the other operations then succeed as has been described. If the color necessitates hoiling or temperature approaching it, which would be inconvenient in an untanned skin, the operation is performed after the seventh operation, and this seventh operation is renewed after dyeing and then followed by the subsequent operations.—*Universal Engineer.*

**PHOSPHATE DEPOSITS IN RUSSIA.**—It is reported that the results of recent geological explorations made in Russia, have shown that there exist in that empire phosphate deposits of sufficient magnitude to supply the wants of Europe for an indefinite period.

**CLEANING IVORY AND MARBLE.**—The *English Mechanic* gives the following recipes: Polished marble or alabaster, when soiled, may be cleaned with a weak lye of potash and soft soap. Muriatic acid is the best thing for removing iron stains; it should be applied with a rag, but if used too freely or too strong, will make the surface rough. The following is the best recipe for removing ordinary stains from ivory or marble: Dust-lime is mixed with the strongest soap-lye pretty thick, and instantly, with a painter's brush, laid on the whole of the marble. In two months' time wash it off perfectly clean, then have ready a fine, thick lather of soap (soft) hoiled in soft water; dip a brush in it, and scour the marble, not with powder, as in common cleaning. This will, by very good rubbing, give a beautiful polish. Clear off the soap and finish with a smooth hard brush till the end be effected.

**PORCELAIN STOVES.**—Russian immigrants have domesticated in Minnesota the brick-lined porcelain stove which everyone who has been in Germany associates with his residence there, and remembers kindly for the even and healthful heat which it diffuses, if not for its cheerful aspect. Since these stoves are air-tight, and hence economize fuel, their introduction in regions where coal and wood are scarce is a matter of importance. It has been found that prairie hay serves to produce a comfortable heat when burned in these stoves, and machinery for compressing it has been put on the market. No doubt the patriotic American who has been taught to crave the quick, fierce heat of sheet iron, will laugh at an apparatus which requires an hour to do its work, but half a loaf is better than no bread and an hour's delay is better than to freeze to death.

**SAW DUST FOR CAR WHEELS.**—The *Lumberman* says: We have been shown a model of a car wheel consisting of an iron rim of seven inches outward diameter one-half inch thick, fitted with a well-proportioned hub, the space between the hub and rim filled with pine saw dust, pressed in so solidly that we are ready to believe the assertion that resting the iron beams upon hearings, a pressure equal to 23 tons applied to the hub failed to develop any signs of weakness.

## GOOD HEALTH.

## Are You Really Clean?

The advantages of thorough personal cleanliness are only appreciated by a few, for most people are ignorant of what thorough personal cleanliness means, and consider ablutions which are confined to the face, neck, and hands all that is necessary. If one were to say to the average man or woman, "You are not clean," it is very certain the average man or woman would be horrified and feel insulted. It is a fact, nevertheless, that largely from ignorance, and partly from prejudice, we go through life "dirty," rarely, if ever, cognizant of the physical pleasure to be derived from perfect cleanliness.

Now, it may be asked here, not inopportunistly, "What is perfect cleanliness?" Briefly, let us describe it as that condition which enables the body to breathe with regularity and ease through the pores of the skin. Whenever the body cannot so breathe, we are not clean, and some internal disorder, more or less severe, is the inevitable result. A great many people are sick simply because they are dirty. Cleanliness, as it is generally understood, means that the surface of the skin is free from dirt. This, however, is not real cleanliness. To be really clean, not only the surface of the skin, but its pores must be free from dirt, furthermore the blood itself should be free from impurities.

It may be said with truth that dirt on the surface of the skin is not nearly so deleterious as dirt in the pores. This statement is proved by the fact that workmen engaged in labor where proper perspiration is induced are rarely unhealthy, simply because, though dirty in the ordinary sense of the term, the pores of the skin are kept constantly washed and clean.

Of this fact most of us are ignorant. Our ancestors in olden times were not so ignorant, and knowing full well that hot and cold water washed the skin, but not its pores, in order to keep themselves perfectly clean, used the hot air bath.

Interesting remains of the hot air bath exist in Assyria, Egypt and Morocco, and in the district of Lebanon, where the habits of the people have always been the same within the memory of man. We have abundant evidences that this kind of bath flourished centuries ago, throughout Europe, particularly in France and England. The North American Indians have a rude form of hot air bath, so also had the ancient Mexicans.

We are indebted to the Turks for the preservation of the bath as it was in vogue in ancient times, hence the name, Turkish bath. The Turks adopted it from their conquered enemies, the Greeks, and made no modification in its practice. During the middle ages, when a bigoted and rabid ecclesiasticism ruled Europe, and when "dirt" became a religious duty, this bath disappeared from use, and public attention was not again drawn to it till about fifty years ago, when David Urquhart, an enthusiastic and scholarly Englishman, who had resided

many years in Constantinople as a member of the English embassy, became convinced of the immense benefit its adoption might be to his own countrymen, and wrote a book upon the subject. Twenty years later, Dr. Richard Barter, a hydropathic physician, located at St. Anne's, in Ireland, took up Urquhart's ideas, went to work and constructed the first Turkish bath in Great Britain. From that time the movement spread all over Europe, and more lately all over this country.—*Food and Health.*

## Danger in Baby Carriages.

The physiological or hygienic effect of the baby carriage on the child has been recently considered by Dr. Henry H. Smith in a paper read before the Philadelphia County Medical Society. Inquiry among physicians tends to fully sustain many of Dr. Smith's conclusions. Divested of technicalities, the results of investigations are that important muscular functions are impaired, particularly those of the spine and abdomen, and that the growth and proper development of the child are greatly retarded by the constant or injudicious use of baby carriages. Other evils, such as impeded respiration, brain congestion, spinal concussion and inadequate digestion or nutrition, are adverted to in this connection with an emphasis which enforces attention, while other considerations are suggested full of interest to those who have the responsibility of bringing up children.

It is said that when a child lies down, as it usually does, in a baby carriage, during infancy, the muscles of the spine remain nearly at rest. When, however, a child lies on its nurse's arms, its head and upper extremities are balanced on its pelvis, thus calling into play the spinal erector muscles and those of the abdomen, together with those which control the lateral motions of the body. "Hence," the doctor concludes, "its exercise in preserving its balance prepares its muscles for the more steady action demanded of them subsequently in creeping, or more especially in walking."

To carry an infant is in fact to train it in balancing its head and shoulders, while the abdominal muscles, acting as flexors of the spine, compress the liver and other viscera, and aid in both respiration and the action of the bowels. Such infants are sooner able to sit alone, creep and walk than the supine product of the baby carriage. Their improved respiration assists the oxygenation of the blood, the waste of tissue ensuing on muscular action increases the necessity for repair, and we find increased appetite, with improved nutrition.

It has been contended that the carriages are beneficial by enabling the nurse to keep children longer in the air. The doctor considers that a nurse unable to carry the child is unfit for her duty. He says, moreover, that the infant is often neglected, and allowed to hang its head over the side of the carriage in a way to induce a certain degree of brain congestion, or is too often found in some position which in time may result in curvature or caries of the spine. Another evil likely to ensue from the constant use of the baby carriage is concussion of the delicate brain or spinal cord of the infant, caused by bouncing the vehicle over curbstones, a matter as severe upon the nervous system of the child as railroad travel has been shown to be upon the more matured organizations of the man.

While Dr. Smith fully appreciates the fact that the use of the baby carriage permits the poor, tired mother a little relaxation, and values it in cases of children recovering from illness, he believes that as a general rule the facts referred to are sufficient to call the attention to the abuses of "a custom that is by no means a necessity in the case of infants, or those under 12 months of age."

**HONEY** can be used in lieu of sugar for almost all kinds of domestic use. It has no superior in the canning and preserving of fruits, making strawberry shortcake, etc. Many persons claim that honey disagrees with them—makes them sick. This is a mistaken idea, and is owing to those persons having eaten honey mixed with the poison of the bee, bee bread, larvae, bees, etc., as the old-fashioned strained honey used to be. But the honey of to-day, such as is produced by intelligent bee-keepers, and bearing their own label, is pure nectar, free from all deleterious substances, and is by far the purest and most healthful sweet known. As an article for the table, both tasteful and ornamental, what can be superior to comb honey? This is now procured mostly in small frames, and is removed from the hives as soon as it is sealed, thus preserving its delicate whiteness. But for use in the cuisine, extracted honey is superior, as it is free from wax, being thrown from the comb by centrifugal force.—*Food and Health.*

**POISONED BY A PENCIL.**—Mr. Samuel Clarke, of Vassellboro, Me., has been in the habit of carrying a copying pencil in his coat-pocket. One day Mr. Clarke went to Augusta, and while in the city he purchased some troches for a cold, which he put loose in the pocket where they were constantly coming in contact with the lead. While returning to Vassellboro on the cars, he felt a tickling in his throat, and to allay the irritation partook of several troches. His tongue at once began to swell and turn black, and by the time he arrived at home he was deadly sick. A physician was summoned, who promptly administered antidotes for the poison. It is said that a piece of the lead of one of these pencils, half the size of a pea, will cause the death of a robust man.

### SAN FRANCISCO:

Saturday Morning, April 16, 1881

### TABLE OF CONTENTS.

GENERAL EDITORIALS.—Swinging Plate for Float Gold; An Improved Hose Coupling; The Sutor Tunnel, 241. Passing Events; Wood River; Locations by Miners; Improvements in Claims; Misrepresentation in Mining; The Mining Bureau, 248. Examining Mines; Manufacture of Machine Tools in San Francisco, 249. Notices of Recent Patents, 252.

ILLUSTRATIONS.—Swinging Amalgamating Plates for Saving Float Gold; Kendall's Hose Coupling, 241. San Francisco Tool Company's Cap Engine Lathe, 249.

MECHANICAL PROGRESS.—Progress in Metallurgy; How to Increase the Power of the Steam Engine; On the Elasticity of Wire; Work for Working, 243.

SCIENTIFIC PROGRESS.—Experimental Transformation of a Living Organism; Importance of Teaching Science; Astronomical Observatories; Railways and Rainfall; Utilizing Solar Heat; Polarization of Sound; Combustibility of Iron, 243.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Assement, Meetings and Dividends, 244.

MINING SUMMARY from the various counties of California, Arizona, Colorado, Idaho, Montana, New Mexico and Oregon, 244-5.

MISCELLANEOUS.—Wheat Shipping; Irrigation Engineering; A State Entomologist Wanted; Soured on Stocks, 248.

THE ENGINEER.—A Mammoth Engineering Project; The Arleberg Tunnel; The Isthmus Canal Project in 1821, 247.

USEFUL INFORMATION.—Wool Velvet; Cleaning Ivory and Marble; Porcelain Stoves, 247.

GOOD HEALTH.—Are You Really Cautious? Danger in Baby Carriages; Money in Food; Poisoned by a Pencil, 247.

CORRESPONDENCE.—Silver in Sedimentary Rocks; San Francisco and Pine Grove District, Utah; Copper Smelting—Its History and Processes, 242. Electro Metallurgy, 241. History of Gun Cotton and Nitro Glycerine, 249.

NEWS IN BRIEF on page 252 and other pages.

### Business Announcements.

Ore Feeder—Joshua Hendy, S. F.  
Dividend Notice—Silver King M. Co.  
Dividend Notice, (Regular).—Northern Belle M. & M. Co.  
Dividend Notice, (Extra).—Northern Belle M. & M. Co.

### Passing Events.

The Legislature is in session at Sacramento, but so far all it has done of interest to the mining community has been done by the committee which has inserted a clause in the appropriation bill giving \$6000 a year for two years to the State Mining Bureau. We have referred to this elsewhere.

Within the next two weeks or so hundreds of miners will change their location. Many are going to New Mexico, old Mexico and Arizona; and others to Idaho and Alaska. The Wood River mines are probably attracting more attention just now than any other section.

For this reason we are having engraved and shall publish next week a map of the Wood River region, which will give to miners a good idea of the new mining region. It will give locations of towns, roads, mines, etc.

San Mateo comes to the front just now as a mining county. People boring an artesian well there are said to have come on a deposit of silver ore. It is said that considerable ground has been honed for the mineral under it. They say the deposit is some 400 ft. down.

Los Angeles, San Diego and San Bernardino counties are also looking up as mining regions. In fact, the southern part of the State is "picking up" in this respect. There is yet a good field for prospectors which, in view of late discoveries, will no doubt be more vigorously prosecuted.

The warm weather of the week is the best assurance that spring is upon us, and soon the hills will be filled with busy prospectors in every direction.

THE IDAHO GOLD MINE, Nevada county, declared a dividend, No. 140, of \$7.50, the other day. A mine that can pay 140 consecutive dividends, of \$6 per share on an average, is a pretty good one. We will add that this mine is in California, and in a part of the county where other similar ones will develop in time.

### Wood River.

Numerous letters from the Wood River country are being published in various journals, in all of which the writers advise intending prospectors to stay away from there till after the 1st of May. There is now too much snow on the hills for prospecting, or for working to any advantage, or developing mines. The local papers say there is no more work for men who want to work for wages now, but from present prospects it is expected that many will find employment by midsummer. But few miners are working for wages. Those that are at work get \$4 per day. Mechanics get from \$5 to \$7 per day. It is said that men of moderate means can get interests in good mines in that region, for developing them.

All those interested in the Wood River region or intending to go there should look out and secure a copy of next week's issue of this journal, as we are preparing and shall then publish a carefully prepared map of the Wood River country, showing streams, towns, gulches, roads, mines, distances, etc.

The Wood River and Sawtooth districts cover an area of 75 by 100 miles, and there is a good deal of unexplored country in the region. The Oregon branch of the Union Pacific railroad will pass within 65 miles of Bellevue, and already the people there are counting on a narrow gauge branch to the town.

One correspondent says that the town of Bellevue contains about three hundred inhabitants, nearly all of whom are prospectors and miners, most of them broke. There are seven stores, five saloons, three restaurants, two barber shops, one lodging house, one tin shop, two stables, and two meat markets, but no hotel. There are not a thousand dollars in circulation in the town. Another says:

Many strangers are arriving in Bellevue; in fact, the town is full of men who are looking out for some place to start into business. Several business men have recently bought lots, and are preparing to build at the earliest possible moment. The great scarcity of lumber in all this country is working a great hardship on those who are desirous of building early this spring. Fifty thousand feet of lumber would find a ready market in Bellevue at \$80 to \$100 per thousand. The rivalry between the townsites has been carried to a pitch bordering on insanity.

The same correspondent (of the *Idaho Statesman*) adds in this connection that the new town of Marshal or Hailey, which a correspondent to the *Salt Lake Tribune* calls "Yip Yap," and says it is "in an old bed of Wood river, is situated on a nice bar well above high-water mark, and in a place that had some natural advantages over Bellevue, it being nearer some of the best mines discovered up to the time of its location last fall. But recent developments east of Bellevue will tend to strengthen that point materially. In fact, it now looks like there would be a good town in each place, and in all probability a city will spring up which will cover all the intervening space."

Another correspondent has the following paragraph in his letter: People not intending to go into business had better remain away from here until the middle of May or the 1st of June. Sleeping accommodations are limited, and no prospects of more until lumber can be brought in. At present there are only two new buildings going up—of cottonwood logs. The hotels and restaurants charge \$8 a week for day board, or 50 cents a meal. All lines of business are pretty well represented. On page 252 will be found the opinion of an Idaho paper on the subject of the time for going to Wood river.

### Locations by Minors.

Not long ago it was decided that a woman could take up a mining claim if she chose to do so. And now it is decided that a minor can take up one. For the benefit of the boys and girls we give the decision in full, taking it from *Copp's Land Owner* for the purpose:

Department of the Interior, General Land Office, Washington, D. C., Jan. 29, 1880.

FRANCIS CUNNINGHAM, Esq., Visalia, Cal.—SIR: You are informed that, in my opinion, the fact that the locator of a mining claim is under the age of 21 years does not render the location invalid.

J. M. ARMSTRONG,

Acting Commissioner.

A good many claims have been taken up by minors in this State, which were afterwards worked by elders, but we do not recollect of the question having come up in connection with the question of patenting the claim. Under the ruling, however, a good-sized Mormon family with two or three dozen children might take up a whole district, and nobody could prevent them. It would be no worse than the case of the "chronic locator," who takes up everything in sight, and does no work on any.

We are glad to see the Land Office officially give the boys a chance. There are many of them in various new mining camps who will be stimulated to try their hands at prospecting.

THE heretofore extensive wood business at Brown's Station, 22 miles east of Carson, is closed. No further contracts will be let, as all the wood in the vicinity has been cut. The clean-up for the season is 86,000 cords, worth \$602,000.

### Improvements on Claims.

"Improvements" on real estate are generally conceded to be houses, fences, outbuildings, etc., etc. "Improvements" on mines are different things, and what they constitute has been a mooted question. The United States laws require certain annual expenditures for improvements on mining claims. Most miners have concluded that these improvements must be in the form of shafts, tunnels, winzes or drifts. It seems, however, that roads and necessary work of any kind may be included in estimates of required \$500 annual expenditures. J. A. Williamson, Commissioner of the General Land Office, has decided that all improvements made upon a mining claim and having a direct relation to the development thereof, may be taken into consideration by Surveyors-General as a basis for certificate of compliance with the law regarding expenditures. In his decision the Commissioner says:

"Any building, machinery, roadway, or other improvements, used in connection with and essential to the practical development of the surveyed claim, will enter into and from a part of the expenditures for improvements, to which you are required to certify. Necessarily, however, improvements of the character indicated must be associated with actual excavations, such as cuts, tunnels, shafts, &c., so as to clearly show that they are intended for use in connection with the claims under consideration. Deputies should make full report of the facts in each case."

Under this ruling (for it is only a ruling, not a law) a man may buy a \$500 portable hoisting engine and put it on a claim, and the purchase will answer for his year's expenditure on the claim. Or, he may build a road to his mine from a mill in town, and make that serve for his expenditures.

In all probability this rule will be taken advantage of in some few instances to evade legitimate expenditure, but the wording of the ruling is such that Surveyors-General can exercise some discretion, so that with honest officials no harm will result. In many instances the rule will be of benefit to poor miners who can spend their money on their claims in a different direction from what they have been accustomed to.

### Misrepresentation in Mining.

We have, in compiling the mining news of the day from various parts of this coast, to exercise a good deal of caution in preventing careless or exaggerated statements from finding their way into our columns. We may not be always successful in this, nor are we able to vouch for the statements made. In compiling our "Mining Summary" every week we always credit the source from which we obtain the news. As it is mainly from journals published in proximity to the location of the respective mines, it would seem that the statements ought to be pretty nearly correct. But the reporter may be sometimes misled by interested parties, or not exercise proper judgment and caution in publishing the mining news.

Still there is a great deal published about mines that we do not care to copy. It is so often the fact that the people who write about the mines know nothing about them; that many very absurd statements find their way into print. And this is, naturally, the case in new regions where mines are found. The results of an assay serve as a foundation on which to build an imaginative prosperous mining camp, and one mine is made into a district. But it is the ignorance of which we complain; it is the deliberate misstatements with which we have no patience. Misrepresentation never does any good. It defeats its own ends. The following paragraph from the *Union Democrat* (Tuolumne county), expresses sentiments with which we heartily coincide.

"A quartz vein found a short time since near the Riverside mine has been reported as rich. It may be or it may not; if it holds out it will be a good paying vein; otherwise, otherwise. There are good mines in this county that are made no better by lying about them. Most of the reports of rich finds and big strikes are grossly exaggerated, or made out of whole cloth. If there is any one thing hard to get at it is the real facts about a mine. Owners will seldom give reliable information and imaginative people are easily fooled. Making a great story when a boulder is broken, or a six or eight inch hole in the ground dug and a piece of quartz found with mineral in it, is thought by some to be mining news. A good mine won't be hurt if it is lied about, and a bad one cannot be made any more valuable with all the lies that can be heaped upon it. A little more honesty on the part of owners and prospectors in the stories they tell will place them in a better position than they now occupy. A purchaser wants what they say corroborated before investing. Mining is a legitimate business, or should be, but there is so much misrepresentation that it is not classed with other enterprises that bear a higher character from being honorably represented and conducted.

THE Lane black sand mine at Randolph, Oregon, is being worked to advantage.

### The Mining Bureau.

We see that the revised appropriation bill contains an item giving \$6,000 annually to the State Mining Bureau for two years. This is mainly owing to the exertion of the Hon. Joseph Wasson, of Mono, one of the few members of the Legislature who takes any interest at all in mining or kindred subjects. In fact, the creation of the Mining Bureau itself is due to Mr. Wasson's persistent and intelligent labor. Gov. Perkins, in his inaugural message, called public attention to the fact that, while mining had done a great deal for California, this State had done very little for mining. Mr. Wasson thought it was time the State did do something in the interests of legitimate mining. After mature consideration and thought, he devised the plan of a State Mining Bureau, where a collection of ores and minerals could be made, and where information and data of value to miners could be obtained. He drew up a bill forming the bureau which was passed. Then the Governor appointed as State mineralogist, Mr. Henry G. Hanks, of this city, an accomplished assayer and mineralogist, well known to the mining community. Mr. Hanks, by well-directed efforts, has succeeded in making a very fine collection of ores and minerals in a surprisingly short time. In fact, the collection is so large that the present quarters of the bureau cannot accommodate a further growth.

The income which maintains this bureau is derived from a tax on the transfer of mining stock certificates, and owing to the falling off in stock speculations, the revenue has fallen off also. Mr. Hanks has, therefore, been cramped for funds. A part of the scheme of the bureau is to collect information on mining districts, processes, mechanical appliances, etc., etc., and to do this it is necessary of course to employ skilled assistants. Owing to lack of funds this has not been possible, since the whole income has been consumed in purchasing cases, paying rents, and salaries of mineralogist, secretary, chemist, and janitor. A large amount of work which Mr. Hanks hoped to have done he has therefore been compelled to defer for the present. Yet it is work which will be eminently useful to the mining community. He desires to obtain reliable information concerning all the various metallurgical processes in vogue, description of all the mining and metallurgical appliances, histories of the various districts of the State, and, in fact, everything which will be of use to the miners of this State.

Mr. Wasson saw that the Chief of the Bureau was unable from lack of funds to carry out his work on the scope proposed; and at the last session of the Legislature, he, at the suggestion of the Governor, introduced a bill appropriating \$10,000 a year, for two years, to the Mining Bureau. Owing to lack of time, the bill was not reached before the close of the session. The gentleman, however, with characteristic energy, brought the matter to the attention of the proper committee, and has succeeded in getting in an item of \$6,000 a year, for two years; which, while not equal to his expectations, will do a great deal toward the work in hand.

This money is to pay the salary of State Mineralogist and the rent. The regular Mining Bureau fund proper will then be left intact for the purchase of cases, payment of expenses of collection of statistics, Museum acquisitions, etc. New cases are wanted; more room is wanted. If the appropriation is passed, the Bureau will be moved to better quarters, where there is more space for displaying the collection.

If this appropriation is made, Mr. Hanks will be able to go on with the work outside the museum. He will obtain for his report a large mass of information, which miners will find useful and valuable. And this is to be practical information too, not so scientific or technically obscure that ordinary miners cannot understand it. If the plan Mr. Hanks has made, is carried out, the annual report of the State Mineralogist of California will be in demand, not only in this State, but in all regions where mining is carried on.

NEW GOLD PLACERS.—The new discovery of placer diggings on the tributaries of the Clearwater, Montana, is attracting considerable attention. The *Missoulian* says that Sam Morris has returned from the new mines and brings a favorable report. The mines are situated on the Clearwater, about twenty miles from Moose creek. It is divided into two districts, one called Niagara and the other Caledonia. According to the laws made by the discoverers and stampers each man is allowed 300 feet, and they all have taken up one claim on each creek—the discoverers being allowed two. There are about twenty men at present holding claims in the new districts, and there are quite a number of creeks of similar character emptying into the Clearwater lower down, and it is highly probable that considerable prospecting will be done in that section during the coming summer.

THE FIRST SAFETIES, those now in general use, were put on the cages of the Potosi in 1865. The first trial was made the same year by Sam. J. Curtis and Major Gillis, they occupying a place on the cage, and one carload of ore. The cable was cut, and the drop was scarce six inches.

## History of Gun Cotton and Nitro-Glycerine

[Written for the Mining and Scientific Press by E. M. Kissler, Secretary of the Union Powder Company.]

## Number Two.

In 1863 when the study of gun cotton and the attempts to apply it were resumed in England, Nobel made known his first attempts to apply nitro-glycerine practically. One of the greatest obstacles he encountered at the outset was the difficulty of exploding it when he wished it to explode (and also that it exploded when he did not want it to explode); but in 1864 he discovered how a mass of nitro-glycerine can be practically exploded by a blow, and Nobel was the first to initiate the explosion of nitro-glycerine by exploders (caps). He conceived the idea of applying as the explosive agency the heat and concussion produced by the detonation of a small quantity of fulminating preparation, strongly confined, as in a percussor cap, and closely surrounded by the explosive liquid; and to him belongs the merit of first applying an initiative detonation as an exploding agency.

Although the ready susceptibility of nitro-glycerine to explosion by an initiative detonation led to its use as a most powerful blasting agent, by whose employment great economy in time and labor could be effected, its liquid nature gave rise to grave disadvantages and dangers in the employment and transport of the substance, which were demonstrated by the occurrence of numerous disastrous accidents, and were not obviated to any effectual degree by the adoption of special precautionary measures, such as the transport and preservation of nitro-glycerine in the form of a solution in methyl alcohol, from which it could be separated when required by the addition of water.

Thus in blasting operations, the nitro-glycerine with which the hole was charged might flow into fissures in the rock, and extend to places where its existence would not be sus-

pected, and where it might afterwards be accidentally exploded during the boring of other holes.

we find an expressman driving up in this port of Bremen just before sailing of a large emigrant steamer, and throwing a large box filled with nitro-glycerine, down from his vehicle, which resulted in a very disastrous explosion. There are four cases where the persons handling the material were entirely ignorant that they were even touching nitro-glycerine, as in each case the manifests did not show what the boxes contained, and it is owing to the concussion which the liquid nitro-glycerine underwent in transit that these accidents happened. Mr. Nobel thinks that the manufacturers in those days were not aware of the immense influence which the metallic packing then used (tin canisters) exercises, even when enclosed in wooden boxes, on the liability of nitro-glycerine to explode by concussion.

At once the question presented itself to Nobel how to preserve the usefulness of this substance with its great explosive energy for blasting purposes and yet disarm it of its terrible danger in handling and transportation.

Here again Nobel's inventive genius made itself manifest in his discovery, by converting this highly dangerous and sensitive material into a substance, which, by maintaining nearly the strength of this liquid, possesses all the advantages of a safe, stable and reliable blasting agent, as compared with nitro-glycerine, with whose aid and assistance the wealth and prosperity of the Pacific coast has been materially advanced, and before whose thunderbolts the portals of our treasury vaults flew open as if struck by a magic wand, as a recompense to our hardy and adventurous miners, with whom it has become a by word—it is needless to say that by it is meant Nobel's dynamite or giant powder. It is not in the province of this article to enter into the details of dynamite, of which will be spoken later on, but it will revert to the history of development of gun cotton, this body being analogous to nitro-glycerine, and consequently the object will be to point out some of their analogies and discrepancies.

have as a consequence the great danger to which our soldiers would be exposed by drying it before its use, we do not see that it offers any advantages or even any saving over black powder."

Much shorter than in France were the experiments made with it in Russia.

After a few unimportant disasters during the first trials, the transport and sale of gun cotton was prohibited throughout the empire.

In England they were more persevering, and the experiments were continued till 1854, but they were abandoned also in consequence of spontaneous explosions, causing serious loss of life.

In Prussia the experiments were continued during a period of eight years, but they were abandoned on account of an explosion in a drying chamber.

More persevering and somewhat more fortunate was gun cotton in Austria, and the results obtained there led to its revival in England. It is owing to the Austrian, Baron von Lenk, who introduced an improvement in this process of its manufacture, that this explosive ever acquired any standing at all, as the gun cotton prepared after Lenk's process is said to possess more stability, and it is said that it can be kept in store during a certain length of time without decomposing. In consequence of these favorable results the Austrian Government appointed a commission in 1852. This commission continued during ten years its labors in a very searching and exhaustive manner, not only in regard to its manufacture; but also as to its action when transported, kept in store, its action in fire arms, small and large, was tried; its effect as a blasting agent was extensively gone into, and resulted in the following report:

"Gun cotton can be used as charges for heavy ordnance, small arms, and other hollow projectiles, and it is also adapted for conduits and mines in military warfare, and as a blasting agent it is better than gun powder."

Based on this report the Austrian government

## Examining Mines.

Some of the Eastern capitalists are just learning enough of the science of mining to know there is a difference between rock and ore. Some of them have bought "mines" containing what was supposed to be "ore," but proved eventually to be "rock." But when they send such "experts" out to examine mines as have within the past year come to this coast, they can hardly blame any but themselves for losses they may incur.

The papers on this coast have continually warned Eastern investors to be careful in this respect. The experience the English people have had with mines in this country ought to be a warning. They sent men here to examine gold and silver mines, who had had only experience with coal, iron or copper mines. Men came who had been foremen or overseers, with practical experience of the details of mine working, but no experience of the general nature required to pass an opinion on a partially developed precious-metal mine. Another thing, there were too many of them of a class to whom \$5000 or \$10,000 was a fortune; and this, held alluringly before their eyes, made them express opinions more advantageous to the seller than buyer.

A consequence of these men being sent here to examine and report on mines was, that our English cousins got one good mine out of a dozen they bought. Still they put more faith in their own countrymen and kept on sending them.

The Eastern people are committing the same sort of errors. They seem to have more faith in a man who resides east of the Rockies, whether he knows much of mines or not, than they do in Pacific coast miners. The fact that a man styles himself "mining engineer," or calls himself a mining expert, by no means proves that he is one. Yet such men are

SAN FRANCISCO TOOL COMPANY'S GAP ENGINE LATHE.

pected, and where it might afterwards be accidentally exploded during the boring of other holes.

The majority of the accidents which have occurred in different parts of the world during the transport of nitro-glycerine are considered to have been due to its leakage from the packages; the great susceptibility of the liquid to detonation especially during hot weather or in tropical climates, would lead to the detonation of such portions by accidental concussion on comparatively slight blows, and disastrous explosions would thus be readily brought about.

Therefore, the main sources of the accidental explosions of nitro-glycerine we find in the reason of its liquid state, and the impracticability of applying a liquid in practice for blasting purposes.

Another source of difficulty and danger in the employment of nitro-glycerine as a blasting agent arises out of its property of solidifying (or as it is termed here freezing) at a comparatively high temperature, about 40° Fahrenheit, in which condition its sensitiveness to detonation is so very greatly reduced that special means are then required to insure its explosion. Its comparative inertness in the frozen state has led, on several occasions, to a recklessly rough handling of the material, which has resulted in accidental explosions. Moreover, the necessity of thawing the substance before it can be used with the ordinary means of explosion, has given rise to the incautious application of heat, and this has been a fruitful source of accident. Instances are recorded where frozen nitro-glycerine was actually put in a red hot stove, or cans filled with it put on live coal. As absurd as this statement will read, it is nevertheless true. The readers of this article will remember the explosion in 1866 at Aspinwall, where a West India mail packet was blown up, a wharf torn down, a number of adjacent ships injured and some lives lost, through the explosion of nitro-glycerine. Not long afterwards that a fearful accident occurred in Wells, Fargo & Co's express building in San Francisco. Later on, a Newcastle magistrate and several other persons fell victims to an accident with this explosive body. Still later,

Nitro-glycerine and gun cotton were discovered nearly at the same period. They are related in their production and in their properties, but their progressive history is entirely different, and a short sketch will not be amiss here. The discovery of gun cotton, by Schonheim, was hailed with delight by practical and scientific men, and immediately after its discovery great many experiments and trials were made with it on a large scale all over Europe, not alone by individuals, but by the different governments, who were inclined to adopt the new explosive for war purposes. But these sanguine expectations were not realized, which everybody seemed to have at the outset, and all the trials were finally abandoned, till of late years it was taken up again in England.

In France, as early as the 3d of February, 1846, the Secretary of War appointed a commission under the direction of the Duc de Montpensier, which included among its members some of the ablest men in France, like Piobert, Morin, the great chemist Palouze, who conducted all the experiments themselves. The result of their trials, extending during a period of three years, in which they entered carefully and extensively into the nature of the explosive, was a verdict of not favorable.

Numerous decompositions and spontaneous explosions, which had as consequences loss of life, were the causes of their unfavorable verdict in 1849, and all further trials with gun-cotton were abandoned in France.

They concluded their report in the following words:

"1. Fire Arms (*armes de guerre*.) In the present state in which this new material is produced by chemists, manufacturers and artillery officers, it is useless to continue to experiment with it in regard to its application to fire arms.

"2. Military Mines (*mines militaires*.) (For war purposes, in destroying bridges and fortifications.) As for its application in military mines, it would be impossible to furnish it to the military service, except in a wet state, by reason of the danger which its conservation presents in the dry state. Should it be even adopted in that wet condition, which would

ordered in the spring of 1862 the equipment of 30 batteries of ordnance, and three artillery regiments were appointed to be drilled into the use of the new explosives on a large scale."

The reports upon this new artillery material were very favorable, and the admirers of gun cotton had now a full right to expect its complete victory. But the change came soon.

On the 30th of July, 1862, a small magazine exploded on the Simmeringer Haide (the military drill ground near Vienna) which contained 2,800 lbs. of gun cotton; very soon afterwards, on the 15th of September, in a factory while twisting some gun cotton into a rope, the same took fire which communicated to a barrel filled with gun cotton, which exploded and killed two men. These two accidents destroyed the confidence of the government, and the Imperial Commission came to the conclusion, that the gun cotton produced up to that period did not possess the requisite stability for war purposes.

In September, 1862, it was ordered that those 30 gun cotton batteries should adopt gun powder again and gun cotton to be used only for Shrapnells. In the summer of 1865, a large magazine containing between 50,000 and 60,000 pounds of gun cotton exploded, there being no doubt as to the origin, spontaneous combustion, as all military magazines in Austria are kept most carefully guarded, which disaster had, as a consequence, the speedy abandonment for its further use, the cessation of its manufacture, and an imperial order for the destruction of all gun cotton stored anywhere in the Austrian empire.

Therefore, it is not to be wondered at if a strong prejudice exists in the Austrian army up to this day against this explosive. After its abandonment in Austria, gun cotton found an asylum in England, and although Von Lenk's persevering efforts to improve the manufacture and devise modes of application of the same, were not crowned with success, they have contributed vastly to secure to this material an important position in England, owing to Abell's improved mode of manufacture, where it enters largely into consumption as a blasting agent.

The writer of this article was at that time a student in Vienna.

apt to get employment by pushing themselves forward, while more deserving and competent miners are in the background.

There are plenty of competent men to examine mines without taking storekeepers, clerks, coal and iron men, and other people with scant knowledge of precious metal mining.

## Manufacture of Machine Tools in San Francisco.

We were pleased to announce last week that a new company, composed of some of our most substantial business men, had engaged in the manufacture of machine tools in this city. They have so thoroughly made their enterprise a local one that their own tools and appliances, except small implements and a cutting-off machine, will be made here.

Lathes, drilling and planing machines for the company's use have been made from their own patterns and drawings, at the Pacific Iron Works, and it is expected that orders for 16-inch and 24-inch lathes, drilling and planing machines can be executed in a few weeks from this time.

We illustrate herewith a 24 and 36-inch gap lathe from the designs of Mr. Richards, Superintendent of the company.

These lathes, as well as larger and smaller sizes, will be arranged with special reference to the kind of work and the method followed on this coast.

The company furnish free to applicants a pamphlet prepared by Mr. Richards, relating to "Modern Machine Tools," and in this may be found detailed explanations of the principles followed out in the designs for various standard machine tools, and also some account of the origin and progress of standard gauge-making in this country, a subject which we have already treated upon in this journal.

We propose to illustrate several more of the standard machine tools made by the San Francisco Tool company in succeeding numbers, and will then extend our remarks, when not encumbered by an introduction of the subject to our readers.

**A DAYLIGHT TUNNEL.**—Ed Dement and his partner Watt, who are mining over towards the South Yuba, scooped out a horizontal hole in the hill 40 ft. long and of various dimensions in height and width. The boys, not being very experienced at the business, were a long time about it, and many an old miner who stopped there to watch their operations was much edified when they glibly told how they were running a "funnel to hit the quartz channel" which some one had told them was just beyond. They estimated the cost of their tunnel by the amount paid out for candles while running it, and when they figured up the other night and found it had cost them five or six dollars a foot on that basis, they almost concluded to abandon it. Next morning, however, upon going to work they found the business had caved in its entire length, leaving an open cut. This would have disheartened most miners, but they look upon it as a blessing. The "open roof" will enable them to work in it by daylight hereafter, they say.—*Nevada Transcript.*

**HOW HE MADE A LIVING.**—Colorado Ike, the individual who blew into town on a high wind, was confidentially interviewed as to how he subsisted. Taking the questioner one side he said in a stage whisper: "I have got a good thing and I don't want it given away. I am a chlorider; I go into such mills as do dry crushing—for instance the Northern Belle mills—and stand around an hour or two, or sleep in the corners if I get a chance. When I come out I have the chloridethat sticks to me assayed and make a good thing out of it, you bet! Do you see that hat?" said he showing an old battered, whitty-brow hat; "well, there is more than three dollars worth of chloridethat in that hat. It had more in it, but Billy Farrell thrashed the dog yesterday and knocked about a dollar and a half out of it. Can you throw up for the beer?"—*Candelaria True Effusion.*

**STARTED UP.**—The furnace at Bullionville started up last Thursday, and is running as well as could be wished for and turning out considerable bullion. There are a large quantity of supplies on hand, and it is the intention to keep the furnace running as long as possible. These works were put up for the purpose of reducing custom ore, and just so long as they pay fair prices for ore they will control the custom business. There is one thing about the Bullionville smelting works that the chloriders admire. Just as soon as the ore is brought there and sampled the chloriders get their money. When it comes to paying, there is no "to-morrow" about Messrs. Godbe & Hampton.—*Pioche Record.*

## Business Directory.

611 and 613 Front Street, San Francisco

Books for Miners and Millmen.

**KUSTEL'S CONCENTRATION OF ORES** (of all kinds), including the Chlorination Process for gold-bearing sublimates, arseniures, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequalled by any other published embracing the subjects treated. Post-paid, \$7.50. Printed and sold by Dewey & Co., S. F.

**AARON'S TESTING AND WORKING SILVER ORES.**—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, \$2. Published and sold by Dewey & Co., S. F.

**COPP'S HANDBOOK OF MINING LAWS.**—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, \$1.00. Sold by Dewey & Co., S. F.

A New Edition.

**KUSTEL'S ROASTING OF GOLD AND SILVER ORES** (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. 1880. A valuable and carefully written work. Post-paid, \$3.00. Sold by Dewey & Co., S. F.

## USEFUL BOOKS

Relating to Casting and Founding, Electricity, Electric Light, Engineering, Drawing, Manufacture of Gas, Heat, Indicator Diagram, Locomotion, Mechanics, Screw Cutting, Slide Valve, Steam Boilers, Steam Engines, Steel, Turling, Wire Gauge, Workshop Receipts. Descriptive Catalogue sent prompt on application.

E. & F. N. Spon, 446 Broome St., N. Y.

## MOREY & SPERRY,

MANUFACTURERS OF

### Gold and Silver Grinding and Amalgamating Machinery

**HOWLAND'S PULVERIZER** Takes the Place of the Cumber-some Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one 1/2 hour of hard quartz that will pass through a 40-mesh screen. The wear is less in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply. Iron Work complete for Wood Frames, also.

**SPERRY'S**  
WROUGHT IRON FRAME  
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

**MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.**

## THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

## HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

**No. 1 XX is the Strongest Explosive Known.**

**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

**JOHN F. LOHSE, SEC'Y.**

Office, No. 230 California Street - - San Francisco, Cal.

## LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for New Prices, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

**JAMES LEFFEL & CO.,** Springfield, Ohio,  
and 110 Liberty St., N. Y. City.

**PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.**

## COLORADO STATE BUSINESS

—AND—

## MINING DIRECTORY.

A Complete Directory of Every Town and Mining Camp in Colorado.

Seventh Annual Volume, 464 Pages.

The Volume for 1881 is now ready, enlarged, improved, printed from new type, and accompanied by Blake's New State and Mining Map of Colorado.

Sent postpaid to any address for \$3.00.

Address

**J. A. BLAKE, PUBLISHER,** - - - Denver, Col.

## STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequalled strength, toughness and durability.

An invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.

CRANK SHAFTS, SHOES, DIES and GEARING specialties.

Circulars and Price Lists free. Address

**CHESTER STEEL CASTING CO.,**

Works, CHESTER, Pa. 407 Liberty St., PHILADELPHIA

## Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

This paper is printed with ink furnished by Chas. Eneu Joanneon & Co., 509 South 10th St., Philadelphia & 69 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorety, 527 Commercial St., S. F.

## THE IMPROVED INGERSOLL

### Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

**GEO. R. FOARD, SOLE AGENT,**  
No. 18, First St., S. F.

Send for a Catalogue.

## Scientific and Practical Books

### on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.

**Concentration of Ores** (of all kinds), including the Chlorination Process for gold-bearing Sulphurets, Arseniures, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

**ROASTING OF GOLD AND SILVER ORES** (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the way and wherefore.

It contains 156 pages, embracing illustrations of furnaces, equipments and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$9.00 coin, postage free.

## EXCELSIOR

### BLASTING POWDER

MANUFACTURED BY THE

Excelsior Powder Company.

This is no so-called "safety" Powder, but a powerful explosive, and as safe to handle and use as any nitro-glycerine Powder on the continent. There is no headache or nausea in the use of this Powder, as the noxious fumes are entirely done away with. It is put up in cartridges of any size to suit consumers and is exploded with cap and fuse, the same as any other high explosive. The following testimonial is a sample of hundreds of the same tenor being constantly received:

GOLD HILL, August 17, 1880.

AGENT EXCELSIOR POWDER CO.—Dear Sir:—I have used your Powder in test cement and hard blasting rock, and find it superior to any Powder I use on the Comstock. It does its work effectually, and does not leave the person using it with a severe headache, like the other Powders do to the majority of miners. In recommending it I would suggest, give it a fair trial and I am confident it will speak for itself. Wishing your Company success,  
I am respectfully yours, etc.,

**GEORGE OLARK,**  
Foreman Sierra G. and S. M. Co.

Address all orders to

**Excelsior Powder Company,**  
Room 40, Merchants' Exchange,  
SAN FRANCISCO, CAL.

## New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

## Metallurgy and Ores.

**WM. D. JOHNSTON,**  
(Formerly Chief Assayer with Thos. Price.)  
**ASSAYER AND ANALYTICAL CHEMIST,**  
118 & 120 Halleck Street,  
Near Leidesdorff, SAN FRANCISCO.  
ASSAYING TAUGHT.

Personal attention insures Correct Returns.

**Nevada Metallurgical Works,**  
No. 23 STEVENSON STREET.  
Near First and Market Streets, S. F.  
ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores Worked by any Process.  
Ores Sampled.  
Assaying in all its Branches.  
Analyses of Ores, Minerals, Waters, Etc.  
Working Tests (Practical) Made.  
Plans and Specifications furnished for the most suitable process for working Ores.  
Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO.  
(Formerly Huhn & Luckhardt.)  
Mining Engineers and Metallurgists

## JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

**ASSAYERS' MATERIALS,**  
**MINE and MILL SUPPLIES,**

**CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.**

118 and 120 Market Street, and 15 and 17  
California St., San Francisco.

We would call the attention of Assayers, Chemists,  
Mining Companies, Milling Companies, Prospectors, etc.,  
to our full stock of Balances, Furnaces, Muffles, Crucibles,  
Scorifiers, etc., including, also, a full stock of  
Chemicals.

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast, we feel  
confident from our experience we can well suit the  
demand for these goods both as to quality and price. Our  
New Illustrated Catalogue, with prices, will be sent on  
application.

Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application. Agents for the Patent  
Plumbago Crucible Co., London, England.

JOHN TAYLOR & CO.

B. N. RIOTTE, H. KUSTEL, GUIDO KUSTEL.

**METALLURGICAL WORKS,**  
318 Pine St., (Basement),  
Corner of Leidesdorff Street, - SAN FRANCISCO

Ores Sampled and Assayed, and Tests Made by any  
Process.  
Assaying and Analysis of Ores, Minerals and Waters.  
Mines examined and reported on.  
Practical Instruction given in Treating Ores by ap-  
proved processes.

G. KUSTEL,  
E. N. RIOTTE,  
Mining Engineers and Metallurgists.

## LEOPOLD KUH,

(Formerly of the U. S. Branch Mint, S. F.)

**Assayer and Metallurgical Chemist,**  
No. 811 COMMERCIAL STREET,  
(Between Montgomery and Kearny.)  
SAN FRANCISCO, CAL.

## THOS. PRICE'S

**Assay Office and Chemical  
Laboratory,**

524 Sacramento St., S. F.

H. DeGROOT, Sr., F. E. BIRGE, H. DeGROOT, Jr.

## DeGROOT, BIRGE & CO.,

**Mining Engineers & Assayers,**

Examination of and Reports on Mines a Specialty.

No. 331 Montgomery Street, Room 28.  
SAN FRANCISCO.

E. N. RIOTTE, GUIDO KUSTEL, M. E. II. MATHEY, M. E.

**NEW YORK  
METALLURGICAL WORKS,**

104 and 106 Washington St., N. Y.

Branch, 318 Pine St., S. F.

ORES CRUSHED AND SAMPLED, AND WORKING  
TESTS MADE BY ANY PROCESS. ASSAY-  
ING IN ALL ITS BRANCHES. ANALY-  
SIS OF ORES, PRODUCTS,  
MINERALS, ETC.

Assaying and Metallurgy of Silver taught theoretically  
and practically.  
Examination of mines and the starting and running of  
reduction works a specialty. Telegraphic reports, of  
guaranteed accuracy, on mines and mills can be ordered  
from San Francisco House.

MATHEY, KUSTEL & RIOTTE, M. E., & MET.

SHEET IRON PIPE.

## FRANCIS SMITH & CO.,

Manufacturers of

**THE PATENT CHANNEL IRON WHEELBARROWS.**

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and  
of the best material. All sizes kept constantly on hand

## SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe.  
Also, Galvanized Iron Boilers, from 25 to 100 Gallons.  
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools  
supplied for making Pipes. Estimates given when required. Are prepared for coating all size of  
Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

## PACIFIC MACHINERY DEPOT.

## H. P. GREGORY & CO.,

Nos. 2 and 4 California Street, San Francisco.

Importers and Dealers in every description of

## MACHINERY!

Sole Agents for the Pacific Coast for

## BUCKEYE

## Engine Company.

J. A. Fay & Co.'s Wood-Working Machinery; Benient & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Belt-  
ing and Packing Co.'s Rubber Goods; Sturtevant Blowers and Exhaust Fan; Tanite Co.'s Emery Wheels and Ma-  
chinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus  
Self-Starters; Gould Mfg. Co.'s Hand and Power Pumps; Eclipse Windmills; Diston & Sons Circular Saws; Otto  
Silent Gas Engine; Dues' Elevator Cups; Ballard's Oak Tanned Belting.  
Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

## GOLD MINERS

WORKING PLACER, GRAVEL AND QUARTZ MINES,  
**SAVE YOUR GOLD!**

- BY USING -

## SILVER PLATED AMALGAMATING PLATES.

The most economical and successful process now in use. Will warrant my Plates to save a very much larger  
percentage of gold than any other method.

SWING AND RIFFLE PLATES for Saving Float Gold Made to Order.

OLD MINING PLATES BOUGHT, TAKEN IN EXCHANGE FOR NEW, OR RE-PLATED.

ALL KINDS OF METAL GOODS PLATED!

San Francisco Gold, Silver and Nickel Plating Works,

653 and 655 Mission St., bet. New Montgomery and Third, San Francisco.

Send for Circular.

EDWARD G. DENNISTON, PROPRIETOR.

Awarded First Premium at Every Fair of the Mechanics' Institute  
for the Last Twelve Years.

## IRRIGATION!

## Land Reclamation!

## THE TURBINE PUMPS.

3,000 to 15,000 Gallons a Minute. Strong, Durable and Cheap.

SAN FRANCISCO TOOL COMPANY, - - - No. 21 Stevenson Street, S. F.

## ALEX. DEL MAR,

**Mining Engineer,**

Formerly Director of the Bureau of Statistics of the  
United States; Superintendent of the United States  
Special Commissioners of Mines; Member of the  
Committee on Mines at the Congress of Na-  
tions held in St. Petersburg, Russia;  
Mining Commissioner for the United  
States Monetary Commission;  
author of a History of the  
Precious Metals, etc.

216 Sansome St., San Francisco.

Mining properties surveyed and reported upon; assays  
and quantitative analyses made of ores, etc.

**TAYLOR & BRUNTON,**  
**Mining and Mechanical Engineers.**

DESIGNERS AND BUILDERS OF

**MILLS AND METALLURGICAL WORKS,**  
FOR THE TREATMENT OF  
Gold, Silver and Copper Ores.

Mines examined with a view of determining their value,  
and the method of treatment best adapted to their product.  
Will furnish estimates, plans and specifications, and super-  
intend or contract for the erection of all kinds of Mining  
and Milling Machinery.  
Leadville, Colorado, P. O. Box 2639.  
New York Branch Office, 68 Broadway, P. O. Box 203.  
S. F. Agents, Prescott, Scott & Co., 51 First St., P. O. Box 2123.

**J. S. PHILLIPS, M. E., ETC.**

May still be consulted by old friends. Address No. 1  
Wall Street, New York.

**F. VON LEICHT,**

**Mining and Civil Engineer,**

432 Montgomery Street, San Francisco.

Reports, Surveys and Plans of Mines made.

## OTTOKAR HOFMANN,

(Of the Firm of Hofmann Bros.)

**Metallurgist and  
Mining Engineer.**

Erection of Leaching and Chlorination Works a specialty.  
Working Tests and Reports made.  
415 MISSION STREET, SAN FRANCISCO.

**METALLURGICAL WORKS,  
STRONG & CO., 10 Stevenson Street, S. F.**  
ORES SAMPLED, TESTED, ASSAYED.

## SAVE YOUR GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me  
from 500 pounds to a ton of their ores, that I can save  
from 25 to 100 per cent. more than any other machinery  
now in use. I will make no charge.  
Machinery can be seen in operation every day at  
No. 143 Fremont Street.

M. B. DODGE.

## SCHOOL OF

**Practical, Civil, Mechanical and Min-  
ing Engineering,**

SURVEYING, DRAWING AND ASSAYING,  
24 Post Street, San Francisco

A. VAN DER NAILLEN, Principal.

Send for Circular.

## SELBY SMELTING and LEAD CO.

418 Montgomery Street, S. F.

**Gold and Silver Refinery  
and Assay Office.**

HIGHEST PRICES PAID FOR

Gold, Silver and Lead Ores and Sulphurets.

Manufacturers of Bluestone.

ALSO, LEAD PIPE, SHEET LEAD, SHOT, Etc.

This Company has the best facilities on the Coast  
for working

**GOLD, SILVER and LEAD**  
IN THEIR VARIOUS FORMS.

PRENTISS SELBY, - - Superintendent.

## MECHANICS' MILLS.

OUR WELL KNOWN  
**WATER TANKS,**

Made by machinery, constantly on hand and made to  
order. PAN STAVES, WOOD PULLIES and OAK  
GUIDES a specialty.

WELLS, RUSSELL & CO.,

Mechanics' Mills, corner Mission and Fremont street.

## M. B. DODGE,

**First Premium.**

**STONE BREAKER AND ORE CRUSHER.**

The Dodge Rock Breaker CHALLENGES THE WORLD  
to produce as good and cheap a machine. Rock  
Breaker and Cornish Rolls Combined in one Ma-  
chine. Pulverizers to granulate Ores for Roast-  
ing, chloriding, leaching & concentrating.

M. B. DODGE, 431 Fremont Street, S. F.

Patent Mill and Street Lamps to Burn Coal  
Oil, Naptha and Gas.

## BOESCH'S PATENT

Hydraulic Mining and Locomotive Head Lights, with the  
Latest Improvements, making them the best and  
cheapest in the market.

**Pacific Lamp and Reflector Factory.**

569 Mission Street, San Francisco.

## Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT  
for DIAMOND POINTED DRILLS, now brought to the  
highest state of perfection, are prepared to fill orders  
for the IMPROVED PROSPECTING and TUNNELING  
DRILLS, with or without power, at short notice, and  
at reduced prices. Abundant testimony furnished of  
the great economy and successful working of numerous  
machines in operation in the quartz and gravel mines  
on this coast. Circulars forwarded, and full infor-  
mation given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 53.

## PACIFIC POWER CO.

Room with steam power to let in the  
Pacific Power Co.'s new brick building,  
Stevenson street, near Market. Eleva-  
tor in building. Apply at the Com-  
pany's office, 314 California street.

## PATENTS AND INVENTIONS.

### List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

FOR THE WEEK ENDING MARCH 29TH, 1881.

9,621.—FELLOW SHAM HOLDER—J. R. Adams, Oakland, Cal. (re-issue.)  
239,449.—ORE FEEDER—E. Coleman, S. F.  
239,453.—LUBRICATOR—J. Gates, Portland, Or.  
9,628.—BOON—J. Hohart, Nordhoff, Cal. (re-issue.)  
239,542.—REIN-HOLDER—J. S. Pitcher, San Diego, Cal.  
239,557.—SWITCH-BOARD—J. I. Sabin, S. F.  
9,629.—HORSE-CLOTHING, J. C. Simpson, Oakland, Cal. (re-issue.)  
239,365.—STEAM HEATER—H. Spence, St. Helena, Cal.  
239,450.—HOLDR FOR NUTS—E. Squires, Beaverton, Or.  
239,407.—TIRE USER—J. E. Tifen, Redding, Cal.  
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### Recent Decisions Relating to Patents, etc

We give below brief abstracts of decisions\* rendered upon patent cases in litigation, for the benefit of our readers:

#### DECISIONS OF THE U. S. COURTS.

##### Allis vs. Stowell.

U. S. Circuit Court, Eastern District of Wisconsin.  
1. An infringement of a patent can only occur by the actual making, using or selling of the patented device.  
2. Doubtful as to whether a mere advertisement of the device constitutes an infringement so as to amount to a disobedience of an injunction.  
3. While the mere fact of the defendant's advertising a machine may not constitute a violation of an injunction, such advertisement would be regarded as very strong evidence that the party was transgressing the order of the court, and would justify a complainant in applying for an order for the punishment of the defendant for contempt of court.  
4. In proceedings for an alleged willful contempt a clear case must be made in order to warrant the court in exercising its power in the way of summary punishment. The case should be one that admits of no substantial doubt in the mind of the court that the party has intentionally disobeyed the injunction.  
5. When machines are sold prior to an injunction, and subsequently returned to the defendant, and again sold by him after service of a restraining order, there is probable ground for a claim of a technical violation of the injunction, from which the defendant can only be relieved by showing that the machines were not only included in the accounting, but that they had been paid for.

##### Dare vs. Boylston.

U. S. Circuit Court, Southern District of New York.  
An exclusive license, under agreement to render an account within a time specified, failing to do so, the patentee granted an order for an injunction to restrain the licensee from continuing to use the invention, and the licensee was held to be in contempt of court for failing to comply with the order.  
Held, That the time of the accounting was not of the essence of the agreement; that no harm had resulted to the patentee by reason of the delay; that no good reason for cancelling the first agreement was shown, and that the second license was valid.

##### Matthews vs. Chambers, et al.

U. S. Circuit Court, Western District of Pennsylvania. Decided January 15, 1881. Acheson, J.  
1. Patents 2,380, re-issue, and No. 44,684, construed to be for internal bottle stoppers which can pass easily into the bottle, and which are closed by outward pressure against a seal formed in the substance of the bottle itself, and hence not infringed by defendant's bottles, in which the internal stoppage is a plug of wood or glass closing by being drawn into a rubber ring placed in the neck of the bottle after the plug is inserted.  
2. Patent No. 44,684, claiming "making the entire stopper of such a length that it cannot turn over in the body of the bottle," is not to be read as embracing all manner of internal bottle stoppers having the specified length, irrespective of other distinguishing characteristics and modes of operation, as such feature is an old and well-known expedient and constructed so broadly the claim could not be sustained.  
3. The said claim, being limited by the specification to a stopper "formed as shown" is not infringed by defendants, even though their stoppers are too long to turn over in the bottle.

\* More complete reports of the proceedings may be found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street, S. F.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

WHEEL HARROW AND SEEDING MACHINE.—F. Batchelor, Sacramento, California. This invention consists in the employment of a sulky or wheel frame, having independent bearing wheels supporting it by means of hangers, and a series of harrows traveling beneath the frame and between the wheels. Stay-rods extend from the hangers forward and to the center, where they connect with a vertical adjusting standard and with the draft bar. The draft is applied directly to the barrow as well as to the sulky.

TELLURIAN.—J. N. Mattick, S. F. This device relates to certain improvements in that class of apparatuses, which is intended to illustrate the movements of the heavenly bodies. Upon a suitable table is mounted an arm, having a globe upon one end representing the sun, and the earth and moon are shown at the other end of the arm by peculiarly arranged globes. These globes are caused to revolve and show the proper revolutions about each other by means of belts.

The Cherry Creek mines were found in 1872. They are 6,000 ft. above tide water, on the west side of Steptoe valley. A good tri-weekly stage runs in from Wells, 100 miles north. The best mine is the Star, which ships \$30,000 a month. It has from four to eight ft. of ore.

### Too Soon for Wood River.

"Our letters from Wood river show that the immigration is setting in at least one month, if not two months, too early. The snow is from two to three feet deep all over the country. There is no lumber and no saw mills in the country. A good many men could be employed in building if there was any material to build with. Bellevue and Ketchum are built up of rude log shanties, and small towns at that, no accommodation for boarding the men who are coming in, and nothing for them to do to earn a dollar. The snow is melting off and will be for a month or more, so that that teams cannot get into Bellevue before the first of May. The road will be soft and no hauling will be done in the towns, and very little into Bellevue, before the 1st of June. There are several saw mills, quartz mills and smelters ready to go in, and they will be got in and put up as soon as possible, but the chances for a day's work before the first of June is very improbable. As for prospecting or starting work on mines already located, it cannot be done before June. We have as much faith in that country as anyone, and would advise men to go there, but it is nonsense to go and board or beg, or eat up all the grub they can pack in, before they can do a day's work. A man can go from here to Bellevue by stage in three days and a half, or he can go there on horseback and lead a pack horse, or with a team, in five or six days, when the roads are ordinarily fair. They can go in the same time from Blackfoot to Kelton. In a week more they can get there from almost any part of the United States. There is nothing gained by the prospector in being there first. It is not like placer diggings, when one can afford to shovel through the snow and sink a prospect hole, nor is it like Leadville, in Colorado, where the leads are all in a bunch, like patch lead mines. Wood River is a big country, at least a hundred miles square, which may be set down as mineral bearing, and we believe the richest large belt of mineral bearing quartz that has ever been discovered. Men should go, to use a miner's phrase, tolerably well heeled. They should take ponies, and grub enough to last them two or three months, and some tools, if they intend to prospect. As soon as spring goods get in they can buy them cheaper than they can afford to pack them, but in that case they will want some spare money. The men who go there for day's work only, with only money enough to get them there, will be dependent on their friends, who have a short supply if they go before there is any demand for labor, which, as we have already stated, will not be before the first of June."

### The Mechanics' Institute Exhibition.

The Board of Managers of the sixteenth industrial exhibition of the Mechanics' Institute, which will open on Tuesday, August 2d, have issued the following rules and regulations, which we publish for the benefit of people at a distance who intend to exhibit:

The pavilion will be open for the reception of goods on Monday, July 22d. The exhibition will be open to the public on Tuesday, August 2d, at 7 o'clock P. M.

Applications for spaces should be made as soon as possible, and not later than July 25th, stating character of exhibit, amount and kind of space required—wall, table or floor. Blanks will be furnished for this purpose. All articles must be in place not later than August 6th.

Space allotted and not taken possession of by August 6th, may be assigned to others. The height of exhibits, on the main floor, must not exceed six feet for opaque objects, nor ten feet for glass or signs. On the partitions, outside walls, and other parts of the building, where light nor view will be obstructed, all the height desired can be taken.

If glass cases are to be used, state their size, height and particulars of the exhibit. This is important on account of light.

In Machinery Hall no rules can be given. The shaft is two and fifteen-sixteenths inches in diameter, has sufficient 30-inch pulleys for all requirements, and makes about 110 revolutions per minute.

The Art Galleries are lighted by sky-lights, with an unobstructed wall space from ceiling to floor.

All persons presenting articles for exhibition must have them registered by the Receiving Clerk, who will give a receipt for the same, which receipt must be presented when the articles are withdrawn at the close of the exhibition.

Articles intended for sale may be labeled accordingly, but cannot be removed until the close of the exhibition, except by written permission of the managers.

No charge of any kind will be made to exhibitors for space. Steam and water will also be furnished free in reasonable quantities.

Every facility possible will be given to exhibit working machinery to the best advantage. The name of every article must be attached by the exhibitor to it.

Perishable articles will be received or may be removed at any time during the exhibition, with the consent of the managers.

The most effectual means will be taken, through the agency of the police and otherwise, to guard and protect the property on exhibition; and it will be the purpose of the managers that all articles shall be returned to the owners

without loss or injury. Still, all articles deposited will be at the risk of the owners.

Spaces will be awarded as early as practicable (after the application has been received), consistent with the proper arrangement of the goods.

All articles arriving too early will be stored free of cost to the exhibitor, and the managers will have them duly placed in proper position for exhibition. No freight charges will be paid by the managers.

The Board reserves the right to exclude from the exhibition all things they deem objectionable, as noxious, articles of an explosive, inflammable, dangerous or offensive character.

### News in Brief.

ALL the accused Nihilists have been sentenced to be hung.

THOMAS CARLYLE left part of his library to Harvard College.

PRINCE PIERRE NAPOLEON BONAPARTE died at Versailles, of gout, last week.

THE iron-molders of Pittsburgh have secured an advance of 10% in wages in 40 shops.

A RATTLESNAKE, recently killed on Muletown mountain, Shasta county, had 30 rattles.

AN earthquake, which did no harm, was felt all over this State on Sunday morning last.

THERE is so much wrath against the Boers that it is now thought the English will resume hostilities.

EMIGRANTS to the number of 20,000 left Bremen, Germany, for this country since the 1st of January.

A TOTAL of 5,068 tons of coal was taken over the Seattle railroad from the 1st to the 6th of March inclusive.

THE advance of the French into Tunis excites great feeling among the natives, and war is regarded as inevitable.

A STAGE will be put in operation between San Bernardino and the Oro Grande mines about the 1st of May.

THE depth of the National ranch, San Diego, artesian well is 215 feet. It is in hard sandstone, and is still being sunk.

GOOD mahogany wood is selling in Eureka, Nev., at \$11 per cord, cedar at \$6, and mixed pine and cedar at \$7 and \$8 per cord.

IT is reported that there will soon be a reduction of force and salaries on the Virginia and Truckee railroad in all the departments.

IT is predicted by men interested in mining matters that there will be 5,000 men in the different mining camps of the Mobave, inside of two months.

SHEIK OREDALLAH has invited a number of Kurdish chiefs to be ready to invade Persia next month. The Porte is taking steps to prevent an invasion.

OVER 40 miles of Wood River valley, Idaho, is susceptible of cultivation. Game and fish are very abundant all over the Wood River and Sawtooth regions.

A PROMINENT cattle dealer of Washington Territory says that the range east of the mountains is starved for miles around with decaying carcasses of cattle.

THE travel over the Utah and Northern has increased wonderfully during the past month. All north-bound passenger trains go through well loaded, mostly emigrants.

THE Journeyman Painters' Association of Boston have decided to demand \$2.50 per day after April 11th, and that nine hours shall constitute a day's work on Saturdays.

ABOUT 70 men are employed at the foot of Webster street, Oakland, making the necessary preparations for the reception of the iron bridge for use of the Narrow-gauge company.

FROM present indications the run of salmon this season will be good, and in anticipation of an abundant catch there is great activity among the fisheries along the lower Columbia.

AN express train on the California and Oregon division of the C. P. R. R. was wrecked near Redding on Sunday. The engineer and fireman were killed, and a number of passengers injured.

THE Massachusetts Charitable Mechanics' Association has laid the corner-stone of what is destined to be the largest building in New England. It is on the Back Bay, and will have six acres of flooring.

THE constant fishing, in and out of season, of the trout streams of Marin county, has so completely exhausted the supply of fish in them that the Fish Commissioners are considering the propriety of stocking them with salmon.

THERE is a rumor going the rounds that Mrs. Mackay, wife of the Bonanza King of that name, has offered \$100,000 to Bishops Monogue and O'Connell for the erection of a cathedral in Sacramento, and the establishment of a Bishopric there for the northern part of California.

GOLD MOUNTAIN is prospectively the leading mining district of Esmeralda, and Esmeralda is prospectively the leading mining county of the State of Nevada. The coming camp is 220 miles from Battle Mountain, its present shipping point. And from this point 500 tons of freight were forwarded to the State Line mines alone during the past winter. From Hawthorne to Gold Mountain the distance is 120 miles, hence this new road has already accomplished a good deal in the way of annihilating teaming distance. So says the Esmeralda Herald.

THE Exchange mine, Cherry Creek, Nevada, belonging to an Eastern company, keeps eight stamps running and ships from \$10,000 to \$12,000 a month.

### By Universal Accord.

AYER'S CATHARTIC PILLS are the best of all purgatives for family use. They are the product of long, laborious and successful chemical investigation, and their extensive use, by physicians in their practice, and by all civilized nations, proves them the best and most effectual purgative Pill that medical science can devise. Being purely vegetable no harm can arise from their use. In intrinsic value and curative powers no other Pills can be compared with them, and every person, knowing their virtues, will employ them, when needed. They keep the system in perfect order, and maintain in healthy action the whole machinery of life. Mild, searching and effectual, they are specially adapted to the needs of the digestive apparatus, derangements of which they prevent and cure, if timely taken. They are the best and safest physic to employ for children and weakened constitutions, where a mild but effectual cathartic is required.

### FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grove walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performance. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce and valuable for future reference and library use.

The State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M., daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

At a meeting of the Board of Directors of the above named Company, held this day, dividend No. Twenty-seven (27), of Seventy-five (75) Cents per share, was declared, payable on TUESDAY, April Twelfth, (12) 1881, at the office in this city, or at the Agency of The Nevada Bank of San Francisco, in New York.

WM. WILLIS, Sec'y.

Office—Room No. 29, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

### NOTICE.

Annual Meeting of Stockholders for the Election of Directors.

Notice is hereby given, that a meeting of the Stockholders of the REPUBLIC MINING COMPANY will be held in accordance with the By-laws of said Company, at the office of said Company, Room 25, No. 310 Pine Street, in the City and County of San Francisco, California, on TUESDAY, the Nineteenth (19) day of April, a. d. 1881, at one o'clock p. m., of said day, for the Annual Election of Directors, and the transaction of such other business as may properly come before the meeting. Transfer books will be closed on Friday, the Fifteenth (15) day of April, 1881, at three o'clock p. m.

WM. J. TAYLOR,

Secretary of the Republic Mining Company.  
Office—Room 25, No. 310 Pine Street, San Francisco, California.

**Lewis Consolidated Silver Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Pioneer Mining District, Pinal County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Twenty-third (23) day of March, 1881, an assessment, No. Four (4) of Six (6) Cents per share was levied upon the capital stock of the Corporation, payable immediately, in U. S. Gold Coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Second (2) day of May, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Twenty-third day of May, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. PEW, Sec'y.

Office, No. 310 Pine Street, Room 15, San Francisco, Cal.

# THE "ROLLER"

## Ore Feeder for Quartz Mills.

The accompanying cut, illustrates the

### "ROLLER" FEEDER,

Patented June 24, 1873, with the Improvement recently introduced, of the Spring Attachment and Grip. This Feeder has essentially many of the equivalents of the ORIGINAL COCHIAN "CARRIER" Feeder, which was patented May 27, 1873, and was successfully introduced into many of the Quartz Mills on this coast. Feeders of the "ROLLER" patent are now in practical use and giving satisfaction in Amador county, and at the Black Hills, Dakota Territory, where they have been used for the last two years.

The Feeders are manufactured by

JOSHUA HENDY.

—ALSO MANUFACTURER OF THE—

"Challenge," "Stanford Improved" and "Tulloch" Ore Feeders,

And of all descriptions of Quartz and Saw-Mill Machinery. A large stock of both New and Second Hand at Machine Works, Nos. 49 & 51 Fremont Street, San Francisco.

AGENT FOR

"Baker's" Rotary Pressure Blowers,  
P. Blaladell & Co's Patent Drill Press and Machine Tools.  
Hot Polished Shafting from the Akron Iron Works, Akron, Ohio.

### Second Hand Machinery Wanted.

Parties having Second Hand ENGINES, BOILERS, SHAFTING, PULLEYS or other Machinery for sale at low prices for cash, will find a purchaser by sending full description, price and location to

JOSHUA HENDY,

Manufacturer of New and Dealer in Second Hand Machinery.

MACHINE WORKS,

NOS. 49 & 51 FREMONT STREET, SAN FRANCISCO.

### BILLEE TAYLOR,

OR THE REWARD OF VIRTUE.

EMELIE MELVILLE OPERA COMPANY.

## Mining & Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers.

## LAND

Good land that will raise a crop every year. Over 14,000 acres for sale in lots to suit. Climate healthy. No drouths, bad floods, nor malaria. Wood and water convenient. U. S. Title, perfect. Send stamp for illustrated circular, to EDWARD FRISBIE, Proprietor of Reading Ranch, Anderson, Shasta County, Cal.

## INCERSOLL ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

## MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting drum, is thrown out of gear by the lever, while the bucket is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX,

49 Fremont St., S. F.

### A Card from Architects.

## The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal. It is with pleasure that we publish the following from prominent Architects in this city:

Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huernoe, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hongland, S. & J. Newson, B. Hendrickson

## A NEW TREATMENT

—FOR—

Consumption, Asthma, Bronchitis, Dyspepsia, Catarrh, Headache, Neuralgia, Debility, Rheumatism,

And all CHRONIC and NERVOUS DISEASES.

PACKAGE CONVENIENTLY SENT BY EXPRESS, READY FOR USE

## AT HOME.

A Treatise on Compound Oxygen, giving the history of this new discovery, and a large record of most remarkable cures, will be mailed free to all who ask for it. Also, "Health and Life," a quarterly journal, containing much interesting information. Write for it. Address the proprietors, DR. STARKEY & PALEN, 1109 and 1111 Girard street, Philadelphia, Pa., or H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., from whom can be procured both information and supplies.

## A NEW BOOK.

A Treatise on the Horse and his Diseases.

By B. J. KENDALL, M. D.

It is printed on fine paper and has nearly 100 pages, 7x5 inches. Price only 25 cents, or 5 for \$1, on receipt of which we will send by mail to any address.

DEWEY & CO.,

202 Sansome St., S. F.

## California Inventors

Should consult DEWEY & CO., AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents, Caveats and Trademarks. Established in 1860. Their long experience as journalists and large practice as patent attorneys enables them to offer Pacific Coast inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 202 Sansome St., San Francisco.

**Engraving.** Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates.

Dewey & Co. { 202 San- } Patent Ag'ts  
some S.

## Iron and Machine Works.

### SACRAMENTO BOILER WORKS,

214 & 216 BEALE St. (rear of Etna Foundry).

J. V. HALL,

PRACTICAL BOILER MAKER.

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK,

Repairing promptly attended to at the lowest possible terms.

### UNION IRON WORKS,

SACRAMENTO, CAL.

ROOT, NEILSON & CO.,

MANUFACTURERS OF

STEAM ENGINES, BOILERS AND ALL

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.

Front Street, Between N and O Streets, SACRAMENTO, CAL.

### Golden State & Miners Iron Works,

Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

### California Brass Foundry,

No. 125 First Street, Opposite Minna.

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. **PRICES MODERATE.** J. H. WEED. V. KINGWELL.

### California Machine Works,

WM. H. BIRCH, Prop'r.

119 Beale Street, San Francisco.

General Mechanical Engineer and Machinist. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturer of Brodie's Patent Rock Crushers and Steel-Faced Tappits. Agent and Manufacturer of F. A. Youse's Patent Steam Packing Rings for Steam Pistons. The best ever invented; can be applied to any Engine Piston and give entire satisfaction to those using. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

### STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

THOMAS THOMPSON.

THORNTON THOMPSON.

THOMPSON BROTHERS,

EUREKA FOUNDRY,

and 131 Beale St., between Mission and Howard, S. F.

MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

## CALIFORNIA Electric Light Company.

Owners of the Brush System of Electric Lighting for the Pacific Coast.

Apparatus for sale for Mines, Mills, Manufactories, etc. Plating Machines and Machines for treating Ore manufactured to order.

Electric Light furnished on all the principal streets of the city.

Office—No. 119 O'Farrell Street,

SAN FRANCISCO, CAL.

### DODGE'S

### UNEQUALLED

### Concentrating Machinery

FOR CONCENTRATING GOLD, SILVER,

LEAD AND COPPER ORES.

Furnaces for Roasting and Chloridizing Ores, for Amalgamation or Leaching. Plans, Drawings and Estimates for Working Ores by any Process.

Established in 1850.

### RANKIN, BRAYTON & CO.

Office—127 First Street, San Francisco, Cal.

### Builders of Engines, Boilers, all Classes of Machinery.

PLANTS FOR GOLD AND SILVER MILLS,

Embracing the latest and most Improved Machinery and Processes for Base and Free Ores.

WATER JACKET SMELTING FURNACES.

For both Galena and Copper Ores of the Most Improved Construction.

Having Built nearly every successful working Furnace on the Coast, we are prepared to guarantee the best results attainable in all classes of Ores.

HOISTING AND PUMPING MACHINERY,

Embracing all Known Improvements.

WHEELLOCK'S AUTOMATIC CUT-OFF ENGINE.

Beyond Question the most economical and perfect working Engine now made.

WALKER'S COMPOUND STEAM PUMPS.

The best in use. Will work with thirty per cent. less steam than any other Pump in the market.

Sole Agent for HOWELL'S IMPROVED WHITE FURNACE.

The only successful Chloridizing Furnace made. Over fifty of them in use on this Coast.

Parties Wanting any kind of Mining Machinery are requested to send for Illustrated Circular.

## William Hawkins,

(SUCCESSOR TO HAWKINS & CANTRELL).

### MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturer of

### IMPROVED PORTABLE HOISTING ENGINES,

FOR MINING AND OTHER PURPOSES.

Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehouses and Public Buildings.

### Steam Engines and all Kinds of Mill and Mining Machinery.

L. C. MARSHUTZ.

### Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

### Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capsitals, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

### San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

### HENDERSON'S COMBINED CATALOGUE OF

### SEEDS AND PLANTS

Will be Mailed Free to all who apply by Letter.

Our Experimental Grounds in which we test our Vegetable and Flower Seeds are most complete; and our Greenhouse for Plants (covering 3 acres in glass), are the largest in America.

PETER HENDERSON & CO.

## Wood River.

The Wood River region is now attracting more attention than any other mining section in the United States, and within the next few weeks several thousand miners will find their way there, many of whom have been waiting for months for spring to open in order that they might start. The *MINING AND SCIENTIFIC PRESS* has sent a correspondent to the Wood River region, and he is probably there now, and we shall shortly have full information as to developments. In the meantime we have had engraved from a drawing made by Mr. A. P. Turner, and kindly furnished to our correspondent, a map of the Lower Wood River, which we present on this page.

The map shows the location of the principal towns of the region, Bellevue, Ketchum and Hailey, the forks, creeks and ravines, the mines and roads, the timber and prairie lands, and the geological formation. It is a "sketch map," of course, but is sufficiently accurate for all practical purposes. The following information concerning the Wood River country we have compiled from various sources, and, having already printed a great deal concerning the region, our readers ought to be pretty well posted about it.

The whole Wood River country is well watered by Big and Little Wood rivers, fed by streams from every canyon and mountain gorge. The water power is sufficient for mills and mining; the mountains are well wooded with forests of red fir and black pine, spruce, etc. This is the country the Bannock Indians fought for several years ago, claiming it as a hunting ground. It is full of game of all kinds—elk, deer, antelope, bear, and the lesser spoils of the hunt, grouse and prairie chickens, while beaver, otter and mink abound. The smaller streams are filled with mountain trout, while the river has a seemingly inexhaustible supply of the larger trout and other fish. Owing to the elevation—5,500 ft.—agriculture may not prove practicable; but the numerous valleys of the mountains and camas prairies to the southwest are covered with hunch grass as thick as it can grow.

The Wood River miner, in speaking of this section, says that the Wood River region embraces several different districts, and is located in southern central Idaho, 130 miles west of the Utah and Northern Branch of the Union Pacific railway. The developments made during last season proved that belt after belt of argentiferous galena ore exist all the way from the low hills at the base of the Wood River range, northward, to the divide of Wood and Salmon rivers, a distance of 45 miles, and almost continuously from Bay Horse district, near Challis, northwesterly, to the south tributaries of Boise river. This makes one of the most extensive silver-bearing district in the world, being 20 to 50 miles in width and 130 to 140 miles in length. The ores are generally heavy galena, 50% to 80% lead, carrying 50 to 1,000 ounces of silver per ton, and of such a nature as to be easily and economically smelted. They occur in true fissure veins from one to four ft. wide. Prospecting has been done largely on horseback and in the most superficial manner, and many rich discoveries must yet be made if past experiences go for anything. Of 800 tons of ore shipped to Salt Lake City for reduction,

in 1880, a large proportion yielded \$100 per ton, above all expenses of mining, soaking, shipping and smelting, although freight alone from Bellevue to Salt Lake was \$37 to \$50 per ton.

The Mineral Hill district is ten miles west of Bellevue, and contains many of the best claims thus far found in the country. The Idahoan shows two ft. of solid galena, 75% lead and carrying 150 ounces of silver per ton. The Bullion is 135 ft. deep and shows a vein of \$150 ore from one ft. to six ft. wide. The May-

Bellevue; the Ornament, Ohio North, Oriental and Ohio South are the principal mines thus far discovered. The veins are from six inches to two ft. wide, carrying galena, chloride, gray copper and carbonates, yielding 600 to 800 ounces silver per ton.

Five tons of quartz stripped from the surface of the main vein at various points yielded \$3,500. These claims were all discovered by J. F. Boyle by the merest accident. His pony strayed away from Bellevue one night, and he hunted

North Star mine, bonded in November last for \$60,000.

Ketchum is 18 miles above Bellevue, on the east side of Big Wood river. Two and one-half miles east of Ketchum, on Eagle creek, is the Elk Horn mine, for which \$12,000 was paid last summer; 180 tons of ore shipped to Salt Lake sold for \$130 to \$140 per ton.

Warm Spring creek, properly the west fork of Wood river, is midway between Upper and Lower Wood River mines, and hence is sometimes mentioned as Middle

Wood River district. The first discoveries were made in May, 1879, and are named West Fork and West Fork No. 2. Both claims show from three to five ft. of galena averaging 100 ozs. silver to the ton. The Irwin has shipped 10½ tons, which sold for \$135 per ton.

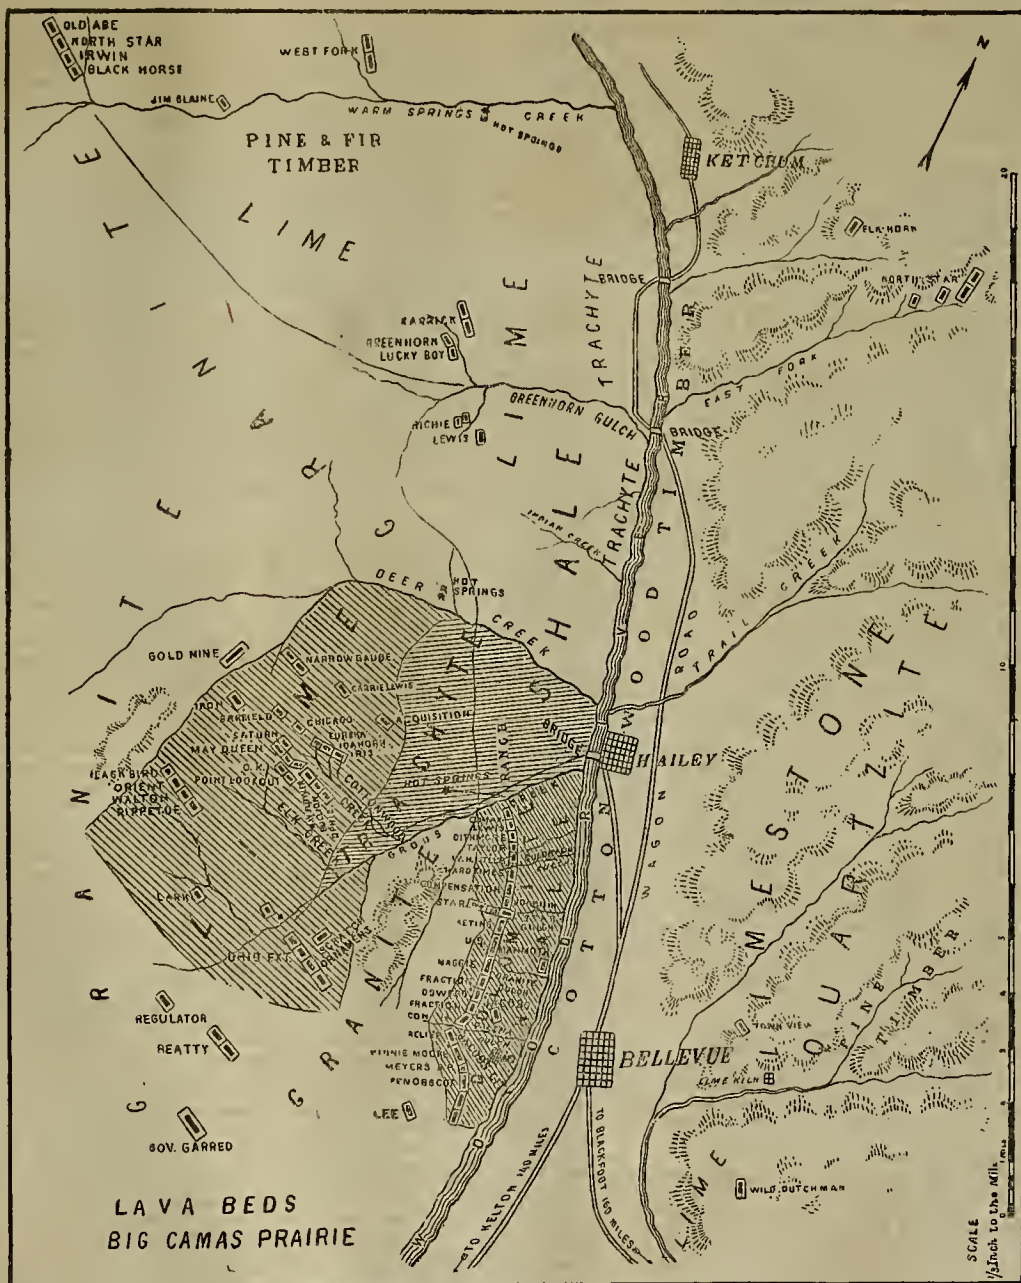

The Idaho has exposed a large body of antimonial silver assaying from \$80 to \$205 per ton. The Wood River is the adjoining location and shows a good body of ore averaging \$150 per ton. The Black Horse exposes 2 ft. of galena and antimonial silver, and assays from \$150 to \$275 silver per ton and 40% lead. The mines of Upper Wood River district comprise all those tributary to Galena City. There are in this region a network of veins, cropping out for 300 ft. and upwards. The Leviathan shows a vein of from 4 to 6 ft., and its ore assay \$210 silver, \$43 gold and 62% lead. The Kate May, Wahash and Last Chance carry about the same quality of ore—\$95 to \$143 silver and 62% to 75% lead.

There are many other districts showing fine veins of similar ores, and, in fact, the whole country is a network of mineral belts. The veins are so located in the hills that they can be easily worked by short tunnels, and the country rock—a limestone—contains all the elements required in smelting and in just the proportions needed for that purpose. The several smelters to be erected in the vicinity of the mines the coming season will insure a heavy output of bullion from this region.

Board without lodging is \$7 or \$8 a week. Supplies are short and will continue to grow scarce until the roads get good, which will be two or three weeks, at shortest. There is no beef in town, and very little bacon, flour, beans, etc. The buildings put up so far are of cottonwood logs. Lumber, when it can be had, is from \$60 to \$100, according to quality, but none is to be had at any price.

Several towns are laid out along the river above here. The first one is Hailey, started as a rival to this place. Many think it will be the principal settlement. Many enterprising men are in the scheme, and it may win, as Austin did over Clifton, at Reese river. The next to Hailey is Clifton, six miles from here, where the most noted mines, such as the Idahoan and Mayflower, are situated. The country rock at Bullion is lime and slate, it being principally lime at Bellevue. Eight miles above Bullion is Ketchum which has nothing but a good prospect to boast of as yet. The next place, 50 miles above here, is Galena, the country rock being slate. The camp was struck late in the season, but the work done during the winter goes to prove the existence of true fissure veins more certainly than at any other point. In the Galena mines the ore changes from base to free milling with depth, they say.

(CONTINUED ON PAGE 268.)

MAP OF THE LOWER WOOD RIVER COUNTRY.

flower is an adjoining claim of great richness. The Jay Gould shows a body of ore from 12 inches to 2½ ft. wide, running 200 ounces of silver to the ton. The O. K., Chicago and Garfield are valuable veins near by which have shipped rich ore. Five miles nearer Bellevue is a valuable group of mines, among which the Climax, Commodore and Minnie Moore are the most noted; they all show large, well-defined veins carrying ore worth from \$100 to \$200 per ton in silver, and averaging about 65% lead.

Boyle's district is five miles southwest of

industriously for him nearly the entire day following, cursing what seemed to be a very bad streak of luck. Finally toward nightfall, the truant was discovered, and, as Boyle was skinning around like a boy endeavoring to catch grasshoppers in his endeavor to grab the rope which the pony was dragging, he stumbled over the croppings of this rich ledge.

West of Boyle's district is a group of promising carbonate mines, showing ore assaying \$30 to \$100 silver per ton and 70% lead.

On the East Fork of Big Wood river, about half way between Hailey and Ketchum is the

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—E.S.

### Tintic District, Utah.

[From our traveling Correspondent.]

EDITORS PRESS:—Tintic district, situated on the eastern slope of the Ogkurrh range, about 80 miles south of Salt Lake City, was organized in December, 1869. It has as good mines as any part of this Territory, but their development has been slow and unsteady, owing to mismanagement. The great misfortune of Tintic has been that its best mines have become the property of timid and inexperienced Eastern men, foreign corporations with unscrupulous superintendents, or men whose better days have been devoted to shearing sheep and herding cattle. I noticed but very few exceptions to this rule.

In consequence of this state of affairs the work done has been merely superficial, or else the mines have been gouged out in a way that will render systematic developments extremely difficult when the district is delivered from its band of gophers. Just now the same odor attaches to Tintic as that which similar causes have brought on Owyhee.

The general formation of the district is granite, limestone and porphyry. Messrs. J. Q. Packard and Juab Lawrence are the principal owners in the Eureka Hill mine, which is noted for its rich horn silver ores that have assayed as high as \$18,000 to \$20,000. The work has been much retarded by lawsuits, but they are now employing a force of 20 men under the superintendency of Mr. John McChrystal. A depth of 400 ft. has been attained, and both milling and smelting ores are extracted that average 60 ozs. silver with 35% lead. This lode is in limestone formation.

The Mammoth M. & C. Co., in which Samuel McIntyre, Wm. McIntyre and A. C. Cunningham are the principal stockholders, operate the Christmood-Mammoth mine. It has reached a considerable depth and is now producing about 35 tons of ore per day. Some very rich pockets have been found containing free gold that milled away up in the thousands, but these are getting scarce, while the bodies of copper and galena get larger and more frequent. The company owns a rattle-trap of a mill consisting of 27 stamps, which is said to be made up of three separate mills of anything but modern construction, but then they are not noted for excessive enterprise in mining and milling matters, since their training has been in a different line. This property, in the hands of a California company, would be to Tintic what the Ontario is to Park City or the Horn Silver to Frisco, but under its present management it cuts a small figure and is of but little benefit to anyone but the stockholders.

The Mammoth Copperopolis mine and mill, owned by an English company, have been shut down for some time. The standstill is due to mismanagement by those who formerly had its affairs in hand. On the Sunbeam lode, which was the first discovery in this district, there are three incorporated companies, but no work is being performed at present. The Golden Treasure, owned by Marshall & Royle, J. E. Dooley and Alex. Graham, is in granite formation, and down about 380 ft. It is one of the best developed ledges in Tintic, having over 1,000 ft. of levels and producing about six tons of free milling ore per day. The ledge is about 20 ft. wide, assaying 60 ounces of silver with some gold. The mine now employs 12 men, and has turned out some 2,000 tons of ore that has been worked at the Tintic mill in Homansville. The Julian Lane is very similar in character of ore to the Golden Treasure, only not so deep. It is owned by S. P. Ely and G. D. Johnson, and only started up recently with five men, having been idle for sometime before. These gentlemen also own a 15-stamp mill, which soon will be running on their own ore.

The Caresa, belonging to B. Roberts & Bros., has also been idle all winter, but is again in full blast. It has a six-ft. vein of solid ore matter, averaging 150 ounces silver. One shaft is down 150 feet, but the ore is now being taken out of another shaft, which has as yet only been sunk to a depth of 30 ft.

The Northern Spy adjoins the Caresa on the north and is in limestone formation. This mine has made a wonderful record for itself since its discovery last October. A shaft has been sunk 100 ft. on the ledge which is six ft. wide, free millings, and realizing 70 ozs. silver and some gold. Five hundred tons have already been hauled to the Tintic mill, and on Christmas, or two months after this discovery was made, \$15,850 in bullion had been shipped. Fully \$30,000 has by this time been taken out of the Northern Spy and yet the total expenses on this mine, including tools, blacksmith shop, etc., up to date do not reach \$3,500. These figures speak volumes for the management of Mr. Alex. Graham, the owner and superintendent of the property, who is to be congratulated on the possession of a veritable bonanza. I can vouch for the correctness of these statements, having been given access to all the books and permission to examine the working assays made from the first start. One peculiar feature of this mine is that bismuth is found in numerous pockets of from 50

to 200 lbs. Mr. Graham now has about two tons of this valuable metal combined with silver, and thinks that his mine has produced more of it since October than all other Utah mines together since the Territory was organized. The assays show up to 55% bismuth with the average amount of silver.
